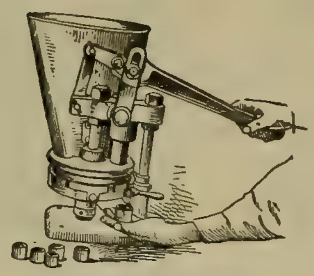
ONE OF OUR MANY SPECIALTIES FOR ASSAYERS.

The Calkins Cupel Machine.

WALL PATTERN.
In position for filling mold.



THE AUTOMATIC.
Showing finished cupel being expelled.

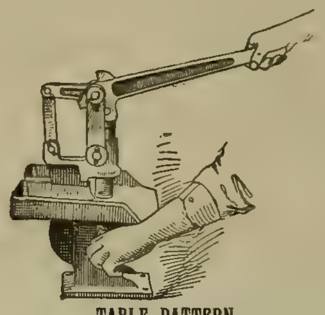


TABLE PATTERN.
Showing position of lever when greatest compression is obtained.

To Assayers:

With these machines perfect cupels can be made by anyone with great ease and rapidity.
They are the greatest labor-saving machine of the Assayer that can be had.
Compact, easily operated, can't get out of order, everlasting.

WRITE FOR OUR NEW, DESCRIPTIVE PAMPHLET IN WHICH ALL OUR SPECIALTIES ARE FULLY DESCRIBED.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Correspondence solicited.
Samples given if required.

DELINQUENT SALE NOTICE.

MAMMOTH GARFIELD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 5th day of June, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Andrew Corbin	13	20.000	$3500 00
Philip Corbin	14	20,000	3500 00
Charles Glover	16	1,750	306 25
Jos. S. Silver	5	5	87
J. M. Spring	15	2,000	350 00

And in accordance with law, and an order from the Board of Directors, made on the 5th day of June, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Rooms 54 and 59, No. 120 Sutter street, San Francisco, California, on TUESDAY, the 2nd day of October, 1900, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

Office—Rooms 54 and 59, No. 120 Sutter street, San Francisco, California.

POSTPONEMENT.

The date of sale of the above described delinquent stock has been postponed to THURSDAY, the 1st day of November, 1900, at the hour of 2 o'clock P. M. of said day. By order of the Board of Directors

SAM W. CHEYNEY, Secretary.

Office—Rooms 54 and 59, No. 120 Sutter street, San Francisco, California.

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of September, 1900, an assessment (No. 24) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of October, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of November, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of October, 1900, an assessment (No. 4) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, Room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of November, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of December, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Room 36, San Francisco, California.

THE DODD IMPROVED CONCENTRATOR
UNION IRON WORKS SAN FRANCISCO CAL.

Patented Dec. 5, 1899; May 29, 1900.

THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

Whole No. 2100.—VOLUME LXXXI. Number 16. SAN FRANCISCO, SATURDAY, OCTOBER 20, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Advantages of Electric Motors.

They are capable of direct connection to the machinery to be operated, which means that their power, however great it may be and however large the machine, can be transmitted by the shaft instead of requiring a belt and a pulley on the driven machine large enough to receive, by the friction of the belt traveling upon it, the needed power. As 1000 feet of belting 1 inch wide must pass around a pulley in a minute to transmit 1 H. P., it is evident that the handling of 100 H. P. will require a large pulley and a heavy belt, which is not only inconvenient and sometimes dangerous, but occupies considerable floor space, and requires that the machine be heavy enough in design to support the large pulley and the strain of the belt. Motors are capable of regulation and control of their speed and driving power with great convenience, so that electrically driven machines can be started, stopped, reversed or speeded up by the use of small instruments known generally as regulators, which may be placed close to the machine or in any other convenient location, while machinery driven by belting can be merely started or stopped, and then only with a considerable manual effort in shifting the belt, or can be run at other speeds only by bodily removing the belt to a driving pulley of different size. Motors, when used for driving machinery, are usually attached directly to the machine, and, being much less bulky than other means of driving, the entire machine is independent of any line shafting, and therefore may be located in a convenient position without regard to this limitation, and in many cases can even be picked up and shifted from one place to another, as the exigencies of its work require.

Electricity permits the saving of one-half the power otherwise required. This results from the fact that when the tool is stopped the motor is stopped and draws no power, whereas in belt driving when the tool is stopped the belt or one of the belts is simply shifted and continues to run on an idle pulley.

View of the International Line at Nogales, Arizona.—See Page 465.

Increasing Business.

The general advance in the manufacturing industries of San Francisco and California is typified by such enlargement of manufacturing facilities as that of the Geo. E. Dow Pumping Engine Co., which on the 1st inst. moved into new and larger buildings. For twenty years the Dow Steam Pump Works have been manufacturing pumping machinery at Nos. 108 to 120 Beale St., San Francisco, and in modernizing methods of construction it was found requisite to have larger and better surroundings. The accompanying picture gives graphic representation of the appearance of the new shops and offices of the new company, extending on First street, San Francisco, from Natoma to Howard street, and on Howard from First to Fremont, giving the company about 50,000 square feet of floor surface. The offices of the company are at 179 First street. The specialties of the company are steam, electric and power pumps and hydraulic machinery; the Dow pumps are found on several United States battleships and cruisers. Dow pumps were on the great battleship Oregon, built by the Union Iron Works of San Francisco; Dow pumps are on the battleship Wisconsin, similarly built, that beat the world's record in her official trial trip in Santa Barbara channel on the 11th inst.

PURCHASE of the Guggenheim smelting interests by the American Smelting & Refining Co. is again asserted, the consummation of the deal to be announced before Jan. 1. When the smelter combine was formed eighteen months ago effort was made to include the Pueblo, Colo., plant and the several Mexican establishments of the Guggenheims; but the proffered price was considered insufficient by the latter. Negotiations have since gone on, and it appears probable that the consolidation will be effected before the close of the year. The figure mentioned, however, $38,000,000, is manifestly an exaggeration. A proposition that had been the subject of considerable negotiation was based about as follows: The Guggenheims to get for all their interests $35,000,000 of American Smelting & Refining Co.'s stock, half in common, half preferred, and they to pay the American Smelting & Refining Co. $10,000,000 in cash. If the preferred stock were quoted at 90 and the common stock at 40, $17,500,000 of each would be worth $22,750,000, and if the $10,000,000 in cash were deducted therefrom, it would represent $12,750,000 as, approximately, what the proffer would net the Guggenheims for their holdings on that basis. It is probable that their properties will be so absorbed.

◆

IT is expected that when cessation of hostilities enables resumption of gold mining in the Transvaal, the value of the properties will be enhanced, because of a direct saving per ton of ore treated and an increase in the tonnage mined. Among other anticipated economies are counted the cheapening of the cost of labor and supplies, the suppression of the dynamite monopoly and the ceasing of the traffic in stolen amalgam. It is expected by the sanguine that the ultimate result of such aggregated savings over the former system will represent an increase in annual dividends of over $25,000,000, based on the tonnage of ore crushed in 1899. Those who figure that way apparently overlook that while the result may be a lessening of costs, it must necessarily be some time before the dividends can be expected to greatly materialize, as the British Government will naturally expect that much of the cost of the war shall be borne by the industry that that war relieved from some of its former restrictions. Now that the South African Republic is no more, it is possible that the cyanide patents may be brought forward in that English colony. The Dutch courts held the MacArthur-Forrest patents to be invalid; but the general recognition of those patents in British courts may serve as a precedent in the Witwatersrand, which now becomes a British colony, and where 35% of the gold recovered is by the cyanide process.

Business, Not Politics.

A little local item in the issue of the 10th inst. of the Mother Lode Magnet, a paper published at Jamestown, Tuolumne county, Cal., is one of the best bits of mining news seen for a long time. It is a brief statement to the effect that Tuolumne county, Cal., supervisors are making repairs on the roads under their control. Ordinarily, whatever is done for the miners in the way of good roads, or any roads at all, is done by the miners themselves, at their own individual expense, and there is nothing that so retards mining development in the State of California to-day as the lack of roads. "No thoroughfare" might be written in a great many instances as the cause of the languishing or death of many a promising mining district in the State. It has not been uncommon for mining men for six months in the year to come into this office declaring that they would be eternally blest if they ever went near such and such a locality again; that they would prefer a trip to a point a thousand miles distant, because of the discomfort and delay attendant upon a lack of communication, at the same time telling of wagon loads of machinery blocked and mired along the road they traveled, and giving details of the expense consequent upon such a state of affairs.

Comment has been made on this before, and the subject is reverted to now only to say that very often it is the fault of the miners themselves. They have the control of these things in their own hands, and with organization and proper use of their votes they could vote supervisors into office that would see that the roads were bettered. This suggestion is consistent with our invariable rule never to have anything to do with politics, but there is no partisan politics in this; it is purely general; it is for the greatest good to the greatest number. Too often men are influenced by partisan pleas and elect a man because he is a good fellow, or because he needs the office, or because he belongs to their party, or because they believe lies that have been told about his opponent; but, viewing the voting as a business proposition, it is good business for the miner everywhere to vote for and stand by the man that he has pretty good reason to believe will work for and stand by him. When we say "the miner" we mean everybody in any way connected, directly or indirectly, with the prosperity of the mining industry, and who look to it, directly or indirectly, for aid in their business. It is the business of the owners of mining property, of resident local merchants, of those who make or supply mining machinery, just as much as the business of the miner, to aid in securing good roads, and the only way to secure them is to put men in office who will see that sufficient tax is levied to raise the money and that that money shall be economically and intelligently spent for the purpose for which it was assessed.

The Tuolumne county, Cal., supervisors deserve credit for the effort to better their roads, and apparently if they had more money at their disposal they would do more than they propose doing. This is a homely subject; there is nothing technical nor particularly scientific about it, but it is a business proposition that has been neglected and now is as good a time as any to act upon the suggestion, in California and anywhere else that good roads would help in developing a mining district.

The proposition is so self-evident that it requires no discussion or argument. It is not business to attempt to put up with such miserable makeshifts as some of the "roads" found in mining districts, and the same ordinary rules of business require that what is taken from the people by taxation should be properly spent. For instance, in the county of Amador, California, there is a special road tax of 20 cents on the $100; there is a general road fund beside. In that county the property is taxed for road purposes this year to the amount of over $24,000, so that so far as Amador is concerned the people of that county are paying for good roads; but they are not getting them. That trouble lies largely with wrong system and mistaken ideas of how the money should be expended. There is considerable public money annually fooled away in "repairs" to bad roads, that leave things no better than they were. The money is spent; that is about all that can be said. It were better to have one mile of good road every year than have such excuses for roads as exist, even where the money is supplied for such purposes. There is no reason why in any mining district there should not be good roads if modern and intelligent methods are adopted.

A high average for a good road, including stone bridges, culverts and other requirements, is $5000 a mile. In Amador county for its $24,000 could be built annually five miles of good, permanent road that would be a good investment for the county; the gain would be many times what the five miles cost, and in a few years it would have what it has not now.

There are few things of greater importance to this west half of America than this matter of roads. A horse can draw on a poor road about four times as much as he can carry on his back; on a good macadamized road he can pull about ten times as much, on a wooden road twenty-five times as much, and on a tramway fifty times as much.

All this has been said over and over again, but, though trite, it deserves iteration and reiteration. It is an ever-present subject and needs more intelligent attention than it appears to be receiving. Accepted everywhere as a silent precept, it should be considered more as an active duty. With the miners themselves rests the remedy. Public spirit, public opinion and the plainest dictates of business are with them—the remedy is organization by the different county miners' associations and a fixed determination to see that money is raised for good road work and spent in such a way as to insure permanent benefit.

A Good Idea.

Spokane, Wash., wants to hold a mining exposition next year. The mining men of that city and section rightly recognize the need of advertising. A mining exposition is good business for any mining center. It is not enough that there should be valuable mining ground, but it is equally essential that the fact be widely known. A mining exposition would be a good thing for Spokane and the Northwest; it would aid in the development of the mineral resources of that great section. A just display of ores, of mining machinery and supplies, an exposition of processes and ore treatment, and a plain, fair presentation of general mining resources would be a grand advertisement for Spokane or for any other mining center. A mining exposition did much for Denver; a mining fair held in San Francisco in 1898 had good effects, still felt; the more public attention can be attracted toward any mining region the more prosperous it becomes. By means of such expositions as Spokane projects, a section gets gilt-edge advertising that it could not get in any other way. Of course, the sum, intent and object of all such advertising is to attract the attention of capital seeking investment. The banks of every large city, East and West, are crammed with money drawing from 3% to 5%, in want of something better, in the opinion of its owners, in which to invest it. In ordinary lines of trade and manufacture competition cuts so into profits that the margin between loss and gain is slight. Investors realize that causes unforeseen and uncontrollable may turn a likely enterprise into disaster. Some of them, too, are inclined to realize that a rightly managed mining investment in a good district stands better chance for profit than in enterprises where ordinary trade rules prevail, and they are inclined to put money into a business in the product of which no competition exists. Of such business gold mining is the only example.

It would be a good thing for San Francisco to have an exposition of that kind. California has yielded an annual average of $26,000,000 in gold alone for over fifty years, and in many parts of the Eastern States and Europe, where the subject is given any attention at all, the impression prevails that California mines are worked out. That is only natural, for it is impossible for any one not knowing differently to imagine how any section of the universe could continue to yield gold profitably for so long a period of time. Of course, Californians know that what has been mined bears the same relation to what remains to be got out that the index of a volume does to the volume itself. Colorado understands the art of advertising and is profiting by it; Spokane, Baker City, Rossland and other enterprising points feel the need of the increased impetus consequent upon such enterprise and commendable endeavor.

Concentrates.

THE density of a gas is one-half its molecular weight.

GLYCERINE is still advancing, and is currently quoted at 17 cents.

COLORADO has paid nearly $300,000,000 in gold mining dividends.

WHEN water falls from a height, every 1390 feet fallen generates 1° C.

SOUTH AFRICAN gold bullion produced by the cyanide process averages about .825 fine.

SULPHIDES of all alkali metals are soluble in water, those of other metals are insoluble.

THE deepest Belgian coal mine is at the Produits colliery at Mons—a depth of 3790 feet.

NATURALLY, an electric pump in a mine has to be geared, because of the high speed rotation of the motors.

CALIFORNIA has in recent years produced 392 tons asbestos, valued at $21,400. The industry is not in present active condition.

IN the U. S. patent office a rejected application is no longer considered a bar to a new application for a patent for the same invention.

A NEAT MODEL showing the movements of slide valves can be had for the asking by any engineer from the Lunkenheimer Co., Cincinnati, Ohio.

THE fare from St. Michaels to Dawson is $40; Dawson to White Horse, $20; thence by rail to Skaguay, $20; thence to Seattle, $16; thence to San Francisco, $12.

THE average cost of smelting or treating silver-lead ores in 1888 and 1890 was $4.50 per ton. In 1895 it had been reduced to $2.80 per ton, and is now about $2.25.

A BILL was introduced in the U. S. Senate at the last session appropriating $25,000 annually to each State and Territory for a mining school therein, but was not acted upon.

CHLORIDE OF SILVER can be made by adding hydrochloric acid to nitrate of silver. If allowed to stand in the light, it will change color from violet to black.

ELECTRIC HEATING APPARATUS is now in common use in many offices and buildings. The entire Odeon theater on the Calle Esmeralda, Buenos Ayres, S. A., is electrically heated.

THE iron ore from Texada Island, B. C., gives 69% metallic iron, .03% phosphorus, .036% sulphur. The cylinders on the battleship Oregon were made from charcoal iron from that ore.

THEORETICALLY, air can be used to circulate around the cylinder of a gas engine to carry off the surplus heat, but in practice water is essential, being less bulky and of greater heat-absorbing power.

REGARDING the "glass oil pipe line," concerning which so many inquiries have been received, the pipe is made by the Appert Glass Co. at Port Alleghany, Pa., in 5-foot lengths of 4 inches diameter.

A GASOLINE ENGINE may be used with economy in operating a mine pump, either geared or belt connected, and with due regard to fire precautions and necessary ventilation need not be considered extra hazardous.

TUNNELS are of use to drain, or shorten distance, as the Sutro tunnel in Nevada, the Newhouse tunnel in Colorado; but, with rare exceptions, no tunnels in this country have ever discovered anything that made them a financial success.

A CURRENT of electricity entering and flowing along a conductor causes no damage to it; electrolytic action takes place at the point where the current leaves it. Statements as to the effect of electrolysis have been greatly exaggerated.

THE last annual convention of the California State Miners' Association was held in San Francisco Oct. 23, 1899. The next one will convene Nov. 19, 1900. The expenditures of the Association for the year ending Oct. 23, 1899, were $15,165.94.

THE Witwatersrand gold output went from 23,155 ounces in 1887 to 4,295,608 in 1898; the 1899 output stopped in September of that year, and was 3,502,051 ounces up to Aug. 31 of that year. The total output to that date was 23,628,263 ounces gold.

"WHITE GOLD" has been found at various times and in various places, notably near Oro Blanco, Mojave Co., Arizona, the unusual color being due to a slight admixture of gallium. It is about .840 fine. It is found in minute quantity in crystallized flakes.

AT the present price of gold in London, 78s 11d for bars and 76s 8d for coin, the price of sight exchange at which gold can be imported is about 4.83½. An advance in the price of gold by the Bank of England would reduce the import gold point in exchange by 1 cent for each half penny.

AT Butte and Anaconda, Montana, the amalgamated properties employ 6060 men, as follows: Anaconda, 3657; Parrot, 282; Colorado, 215; Washoe, 193; Butte & Boston, 628; Boston & Montana, 1085. The Montana Ore Purchasing Co. employs 453 men and the Clark properties 428—a total of 881.

THE Mexican mining law says that "the unit of concession or mining claim shall be a solid of indefinite depth, limited as to its exterior boundaries by a section of the surface embraced within a horizontal plane measuring 100 meters on all four sides, and in depth by vertical planes passing through the same."

RECORDS of experience in mining and milling are always of value and their recital would contribute to the common stock of knowledge. Their receipt would be of service to this paper and the mining industry in general, and our readers are courteously solicited to furnish such notes whenever agreeable and convenient.

LIQUID CHLORINE is chlorine gas compressed to liquid by a pressure of 200 pounds. One drum of liquid chlorine weighs 300 pounds, holds 115 pounds liquid chlorine and takes the place of 972 pounds manganese, 1080 pounds salt and 2160 pounds sulphuric acid. A drum is 10 inches diameter and 5 feet long.

A MOTOR-GENERATOR is a transforming device consisting of two machines; a motor and a generator mechanically connected together. A dynamotor is a transforming device containing both motor and generator action in one metallic field, with two armatures or with an armature having two separate windings.

ORE carrying 50% lead and fifty ounces silver per ton would be "high grade" as a smelting ore; with fifty ounces silver and no lead it would be considered "low grade" for either smelting or amalgamating. Ore carrying 100 ounces silver would be high grade, considered as an amalgamating ore, and low grade viewed as smelting ore.

PALLADIUM is obtained chiefly from a gold ore found in Brazil. The ordinary process of producing it from the ore is, after addition of silver, to fuse, then treat with nitric acid, the silver and palladium dissolving, the gold remaining undissolved. The silver precipitates as chloride; the palladium as a cyanide; the latter being ignited decomposes, leaving palladium.

A VARIETY of antidotes are proposed in the case of swallowing corrosive sublimate. The best, in every way, is considered to be the immediate swallowing of the white of eggs. The white of one egg will neutralize four grains corrosive sublimate in the human stomach. "Concentrates" is unable to give any antidote for poisoning by inhaling the vapor or fumes of mercury.

A "LONG-STROKE" engine has a stroke about twice the diameter of the cylinder. A 20x48-inch, or a 16x30-inch, would be a long-stroke engine. Short-stroke engines have a cylinder with a diameter as large or larger than the length of stroke. Slow-speed machinery needs a slow-speed engine. An engine a little larger than required is more satisfactory in the long run, or the short run, than one that is too small for the load laid on it.

IN acute cases of lead poisoning sulphate of zinc, to cause vomiting, should be administered, followed by sulphate of magnesia in milk, mixed with white of egg. In chronic cases of lead poisoning give iodide of potassium three times a day in five-grain doses and sweetened dilute sulphuric acid in water. At the first indication of lead poisoning the work should be promptly discontinued and proper treatment at once adopted. All the soluble salts of lead are poisonous.

THE nickel matte produced by smelting the nickel ores at Sudbury, Ontario, Canada, contains about 350 pounds copper and 350 pounds nickel in a ton. The other 1300 pounds is sulphur and iron. The freight on the 2000 pounds to the New York City refinery is $5.50. Last year the Canadian Copper Co. (the owners) shipped 18,000 tons matte to New York City. Nickel ore or matte comes into the United States duty free. The refined metal pays a duty of $120 per ton.

A GASOLINE FIRE is best extinguished with flour, sand or earth in the order named; water should not be used. If the gasoline be confined in small space, ammonia will smother it. Some users of gasoline find it well to hang a bottle containing about a gallon of ammonia from the top of the tank or room containing the gasoline, by a string or fusible link, so that if the gasoline takes fire the bottle will fall and be broken, releasing the ammonia and promptly putting out the burning gasoline.

THE largest gas engines in the world are using blast furnace gas for fuel. At the Duedlinger Iron Works, Luxemburg, are two 1000 H. P. gas engines and one 500 H. P. gas engine in which blast furnace gas is utilized. The largest single cylinder gas engine is in operation in Belgium. The cylinder is 51.1x54.1 inches. The Westinghouse works at Pittsburg build the biggest gas engines in this country—650 H. P. The Union Gas Engine Co. of San Francisco has built a 300 H. P. gas engine.

TELEGRAPH POLES can be prevented from rotting in the ground by surrounding the portion of the pole in the ground with an earthenware pipe, similar to a small drain pipe, the end of the pipe coming just above the surrounding soil. Into the space between the pole and the pipe is placed a mixture of sand and resin. The resin is melted and poured into the pipe in that condition. When it solidifies the sand and resin form a watertight preventive against the butt of the pole rotting.

CALCULATIONS on the subject made some time ago by F. W. Dean of the American Society of Mechanical Engineers, indicate that since 1870 the cost of steam power has been reduced from 30% to 40%. He attributes 17% of this improvement to higher steam pressure and ratios of expansion, multiple-cylinder engines, steam jacketing and drying or superheating the steam; 5% to the use of vertical engines; 7% to improved boilers; 7% to economizers heating the feed water, and 2% to improved grates. The weight of steam used per horse power per hour has fallen from 20 pounds to 12.5 pounds. He finds the compound engine the usual, and on the whole most successful, form of engine.

BITUMEN is any unsaturated hydrocarbon mixture of mineral occurrence, whether solid, liquid or gaseous. Bitumens, from natural gas to asphaltum, include compounds and mixtures of compounds belonging to all the known series of hydrocarbons. They may be classed as follows: Solid—asphaltum; semi-fluid—maltha; fluid—petroleum; volatile—naphtha; gaseous—natural gas. Some of these fluid varieties of bitumen pass by insensible degrees and by natural causes into maltha, which is a semi-fluid viscous form of bitumen, known as mineral tar and just as clearly to be distinguished in consistence from petroleum as common tar is to be distinguished from olive oil. The change by which California petroleum is converted into maltha is due to two causes, evaporation and indirect oxidation.

SMELTER treatment charge on copper ores varies with the nature of the gangue; minimum treatment charge would be about $6 per ton, maximum about $9. Copper in ore is paid for at a price based on the New York daily quotations for casting copper, less 6 cents per pound. "Dry assay" is the net assay, less an arbitrary reduction of 1.3% which is common to the trade. Nine and five-eighths cents per pound would be equivalent to $1.92 per unit, or for each per cent of copper in the ore. An ore with a favorable gangue, containing a little in excess of 3%, would pay the cost of treatment, and anything in excess of 3% would be in the nature of profit after deduction of charges for mining, transportation, etc. If the ore contains precious metals, these are ordinarily allowed for on the basis of 90% of the value at current metal quotations.

SECRETARY BLISS of the Interior Department writes regarding the $500 expenditure required upon mining claims, saying that "while an expenditure of $100 in labor or improvements admits the claimant to occupancy for one year, $500 is required for continued occupancy and enjoyment. While several claims in common may be embraced in the same application for patent survey and notice, a single expenditure of $500 will suffice for but a single claim. Whatever constitutes a proper annual expenditure under Section 2324 may unquestionably be treated as part of the greater expenditure exacted by Section 2325, and since the former is deemed to have been made upon each of several claims held in common when it is made upon any one of them for the benefit of all, so under Section 2325 the expenditure will be deemed to have been made upon each of several claims held in common, and included in one application for patent when it is made upon any one of them for the benefit of all; but the expenditure of money must equal in value that which would be required on all of the claims if they were separate or independent."

ALL poisons are traced to the circulation, and it is observed that death is the result; but there is no satisfactory explanation of the fatal effects or how the poison operates. The blood seems to be so changed by the poison as to render it unfit to perform its proper functions; but neither chemistry nor physiology throws any light upon the changes produced by any poison in the blood or the vital organs. It has been clearly shown that no substance acts as a poison until it has been absorbed and passed through the arterial capillary system. The sooner the poison reaches the blood the more rapidly does it act, and it depends not so much upon the quantity as the amount absorbed in a given time. The time for this absorption, under favorable circumstances, is only a few seconds. The fatal effects are produced when the absorption takes place more rapidly than the elimination. The fatal proportion of poison present in the blood at any one time is infinitesimally small (one-sixteenth grain of strychnine has caused death in four hours). The blood is about one-thirteenth of the body by weight, and the proportion of the poison by weight compared with the blood would be less than one part in one million. The poison of a cobra is in even smaller proportion; yet the blood, urine, saliva or milk of an animal poisoned by a cobra, when injected into the blood of another animal, will produce death.

THE case of A. Walrath vs. the Champion G. M. Co. was reported at great length and fully illustrated herein at the time. The suit was from Nevada Co., Cal., and was brought for an injunction and $300,000 damages. End lines and extralateral rights were involved. It was claimed by the plaintiff that the Champion had gone under the surface of the Providence to some extent. The case was tried in the United States Court of this circuit, which gave judgment for the defendant. An appeal was taken to the United States Circuit Court of Appeals with like result, and finally the United States Supreme Court made these decisions final. In the judgment thus upheld it was decreed that the patent to the Providence mine was confined to the Providence lode and to the surface ground as surveyed and marked in the diagram filed in the Land Office. The Act of 1872, in granting all other veins that were within the surface lines of previous locations, did not create any new lines for such other veins nor invest the court with any authority to make new lines for such other veins. When the end lines of a mining location are once fixed they bound the extralateral rights to all of the lodes that are thereafter found within the surface location. It necessarily followed that the end lines of the Providence survey must be considered by the court as the end lines of any and all lodes or veins which lie inside of such surface lines.

" How to Make Gold Dredging Pay."

In the current number of Cassier's Magazine is an article with the above title, written by A. W. Robinson.

A great deal has appeared in this paper during the last four years on this subject, chiefly original contributions from experienced men, and those articles have formed the base of much that has been reproduced elsewhere concerning this form of securing gold.

Mr. Robinson's article is not a strictly technical one, and partakes more of the nature of an essay than a specific exposition of the subject, but contains some salient points that, even though said before, deserve repetition. In a general way the article is of considerable value from the standpoint of a civil and mechanical engineer. Mr. Robinson says:

Dredging for gold seems at first sight to be a simple proposition, and yet the numerous failures that have occurred make it necessary to exercise caution and to examine carefully the causes of failure, as well as to study the elements of success. If properly conducted, it is one of the safest forms of mining, for the reason that the ground can be examined, tested and the probabilities determined beforehand with reasonable accuracy. It then becomes analogous to manufacturing, with the ground as the raw material and the gold as the product. To attain success in manufacturing, a man must be master of his business, must have an ample supply of raw material and must be able to sell at a proper advance over cost of production. In other words, there must be good men, good material and good markets, and this may be all summed up in two words—good management. As good management is essential to success in ordinary business affairs, so is it in the business of dredging for gold.

There is this advantage over other forms of manufacturing, in that the product is of uniform fixed value, and always marketable without expense of selling. Every ounce of gold won is that much money to its owner and a permanent addition to the wealth of the world. Gold dredging is, however, analogous to manufacturing in that the cost of production must be less than the value of the product. Given good management, therefore, to begin with, the two cardinal points to be determined are, first, the value and extent of the ground and, second, the cost of working it. The success of the whole enterprise depends on the correct determination of these two questions.

As to the first point, namely, the value and extent of the ground, a thorough examination should be made by a person possessing the necessary ability and experience, and one who is able to draw sound conclusions from his observations. This is not work for a young college graduate, nor yet for the so-called practical miner, although both may render efficient help. Still less is it the business of men in other walks of life, who, thirsting for riches, turn to gold mining, expecting an immediate fortune. His opinion will be safest who has had not only the wide experience in all lines connected with his work, but who has likewise the honesty of purpose and soundness of judgment to avoid deceiving himself or his clients, and who can determine whether or not the proposition has in it the elements of financial success.

Many men whose opinions are trustworthy on other subjects are entirely unable to form a sane or just conclusion on matters connected with gold. Many, if not most, men also are inclined to put a better face on the question than usually exists, and the sight of a few yellow colors leads them at once to figure out a bonanza. If investors would only bring to bear on gold mining the same prudence and business sense which is necessary in any other business, it would greatly reduce the number of failures. The same care should be exercised in preparing a full statement of all facts and figures bearing on the case, as in any carefully thought-out manufacturing enterprise. How often do we see the opinions of cheap and incompetent men accepted instead of carefully ascertained facts.

The business of legitimate mining and dredging for gold has suffered much from the evil reputation occasioned by the failure of many schemes that ought never to have been entered upon. Had a competent engineer been consulted, many of these enterprises would never have been begun, or at least would have been carried on in a very different manner. The investor has to guard against two classes of evil advice. One is that of the professional swindler who 'promotes' the property for the sole purpose of transmitting the funds of the subscribers into his own pocket, and the other is the well-meaning man who perhaps has a fairly good thing if properly worked, but who has more self-confidence than experience and skill.

The ground should be surveyed—if not accurately, at least approximately—and a map prepared on which may be recorded the positions of the test pits, the area available and the extent of the ground worked over each season. Test pits should be sunk at sufficiently frequent intervals to place the nature of the ground beyond conjecture. The examination should show the full depth of the gravel, the nature of the bedrock, if any, and the distribution of the values, whether they are greatest at the surface, in layers or on the bottom. Values are never uniformly distributed, and nothing is more deceptive than a glib statement of so much per cubic yard. It requires the most careful judgment to arrive at a fair average value which will represent the whole.

The nature of the material should also be ascertained, and this not only on the surface. The sizes and percentages of the gravel, from coarsest to finest, should be measured. This is necessary to determine the character of screens to be used, or whether any at all are necessary. The action of the gravel while being washed or sluiced should be experimentally determined. Some gravels wash very freely; others, again, are of a clayey or sticky nature, which renders them very difficult to wash. Such gravel requires very careful treatment in order to avoid loss of gold. Other deposits are of a very hard or cemented nature, often with large boulders, which increase the difficulty of working, and, if not fully provided for, failure will ensue.

The condition of water supply is most important. Water is essential to the recovery of gold, and its presence in suitable quantities is a great desideratum. In dredging beds of rivers, the depth, speed of current, fluctuations of level, extent and duration of floods must all be closely observed and their bearing on the proposed enterprise considered. In many rivers the richest pay is found in the 'bars,' which are shoals or deposits of gravel brought down by the current and formed by slack water. These are frequently dry at low water, and the dredger must, therefore, be able to cut its own flotation into a dry bank.

Gold dredging is not necessarily confined to river beds or natural water courses. Any deposit may be worked with a floating dredge in which the water can be impounded, and a small stream let into the pond in which the dredger is situated, sufficient to supply evaporation and leakage, and to keep the pond clean enough for washing purposes. The same water can be used over and over again in this way, but the dredger must be specially adapted to each case. A dredger which will be suitable for a river channel may not do the work at all in an enclosed piece of ground, and vice versa.

The disposition of tailings is a subject which must be carefully studied. Unless the dredger can get rid of all material passed through without choking or piling up in such a manner as to interrupt its work, it is liable to be stopped, and the entire enterprise brought to a standstill until the difficulty can be remedied. The configuration of the ground, the character of the material, the depth of the water and the height of ground worked above water all enter into the question and should be carefully determined.

As to the gold itself, the question is threefold. There are to be considered, first, the character of the gold; second, its value per cubic yard of material handled; third, the best method of saving it. On the satisfactory determination of these points the whole success of the enterprise depends, and here long experience and sound judgment are absolutely necessary. The gold may be fine or coarse, of all degrees, and may be easy to save or difficult to save, and the most effective method of saving it depends upon its character. There is no 'new discovery' for gold saving. All known methods depend on one thing for their successful action, namely, the great specific gravity of the gold as compared with gravel. Their separation can be effected only by washing with water, aided sometimes by amalgamation, but the methods of washing are subject to wide variation. There are the two extremes of heavy hydraulic sluicing with large volumes of water, carrying down boulders and everything before it, and the thin film of fine concentrates, requiring delicate adjustment for saving fine gold.

As to the value per cubic yard, this is perhaps the most difficult point on which to obtain a reliable estimate. The difficulty is not so much that it can not be ascertained, but that men involuntarily exaggerate the findings, and there is an extraordinary inclination to take the best and richest spots as an indication of the whole. The only safe way to do is to wash out a considerable quantity for each test, say not less than a cubic yard, taking care that all the material—boulders and all—is included in the measurement, and carefully weigh the result. A sufficient number of these tests, carefully made, will indicate the average value.

In many places in the United States, Chinamen or tramp miners can be found working along banks of streams or on river bars with rocker and pan. Wherever these remain any length of time there is sure to be gold in paying quantities. It may, however, exist only on the surface, for these men can not work deep.

After all the foregoing points have been settled, there remains the final question—What will it cost to work the property ? This is a broad question, and the answer to it is to be found only by subdividing it into all the points which affect the cost, and making a careful analysis and estimate. These points include (1) transportation, (2) cost of living and wages, (3) cost of fuel, (4) cost of lumber and other material of construction, (5) water supply, (6) character of material, (7) depth of working and (8) study of any special difficulties that may be presented. It is impossible to give any data as to these various points or the general conclusions that may be drawn from them. Each locality will have its own characteristics which may be more or less favorable. The dredger itself will be designed to suit the conditions as they exist and its output and operating expenses estimated. The actual output should not be estimated to be more than half the theoretical, and a liberal allowance should be made for contingencies and repairs. Under favorable conditions dredging can be done for 4 or 5 cents per cubic yard, or even less, and under difficult and costly conditions the cost may rise to 20 or 30 cents, or even more.

The dredger itself is a most important factor in the cost of operating, but it is not proposed here to go into the mechanical detail of its construction, as that is a large subject by itself. It is sufficient to say that for all ordinary conditions the elevator or ladder type of dredger has become recognized as the standard. It is usually composed of the following elements: (1) The dredging machine proper, (2) a revolving screen in which the material is washed and the coarse stones are removed, (3) a centrifugal pump for supplying water to the screen, (4) gold-saving tables or sluices and (5) apparatus for disposing of tailings.

All these elements are suitably combined upon a hull with boilers, engines and accessories. It is absolutely essential that the dredger be designed and built by those experienced in such work, and that every detail should be of ample strength and suitable for the purpose. A great many dredgers have been built; and while they are by no means finally perfect, experience has developed their construction along certain lines which have been shown to be the best. This experience has cost large sums of money, and he would be foolish indeed who would undertake to build a dredger out of his own unaided genius without a thorough knowledge of the work of others in this line. These dredgers must, as a rule, work in remote places and be operated by ordinary labor. It is, therefore, of the first importance that they should be of the simplest possible construction, with every part of ample strength, and not liable to get out of order. The earlier dredgers were very deficient in this respect, and, if breakdowns and repairs are frequent, the profits may be quickly converted into losses.

When a dredger is standing still from breakdown there is a four-fold loss going on: (1) Interest on investment, (2) cost of replacing the broken part, (3) expenses of crew and administration and (4) loss of gold that would be gained if running. The first cost of the part that failed is but a trifle to the other losses, and the first cost, therefore, of the entire dredger is of slight importance, provided it is of proper design, well built and capable of working continuously without breaking down. Some repairs there must inevitably be, owing to the severity of the work and the wear and tear due to handling the material; but a distinction must be made between such natural wear and parts structurally weak which may fail without warning. In a good design not only will all parts subject to natural wear be capable of ready renewal, but all important parts subject to strain will be of the strongest design and have a large factor of safety.

Suppose a dredger is earning $400 per day, and is delayed thirty days through the breakage of some part not readily replaced. There are $12,000 lost, without counting interest, or cost of repairs, or wages. A fraction of that amount, put into better design and better material at the outset, would have been the best possible investment. Steel castings can now be obtained at about twice the cost of iron castings, and should be used wherever possible instead of iron, regardless of the extra cost. Some dredging machines on the market are but cheap affairs, made to sell, not to last, and no care or trouble is taken to adapt them to their work. Indeed, the builders of them rarely have that experience in operating and maintaining them that is necessary. A cheap dredger is necessarily a poor one, for the requisite strength and quality can not be obtained without cost; but, on the other hand, an expensive dredger is not necessarily a good one.

When the cost of fuel is high, special attention should be paid to economy of steam in the design of the dredger, such as using compound condensing engines and efficient boilers. If fuel be cheap and abundant and skilled labor high, simple high-pressure engines will answer every purpose. Water power may also be utilized to good advantage for driving a dredger or series of dredgers, employing electric transmission. The perfection of modern electrical apparatus for the generation and transmission of power is such that it is, on the whole, quite as reliable as steam. So far from being more complicated, it is, in fact, simpler, for the substitution of simple electric motors for boilers, pipes, pumps, engines and valves involves fewer parts and less liability to derangement.

In addition to all the technical and commercial elements which have been touched upon, the financial strength of the company intending to operate is of not less importance. It would be useless here to make recommendations as to amount of capital required, as circumstances are widely different. The funds should, however, be available before beginning, and should be sufficient to meet and overcome any reasonable obstacle or difficulty that may arise. That must be left to the judgment of the business man and the engineer in taking up each special case. Enough has been said to point out the way and to indicate the lines on which this class of work may be successfully carried on. There are few more promising or more profitable fields of work when carefully administered, and the ground available has as yet scarcely been touched. Unfortunately in many cases large sums of money have been squandered without result because of the lack of knowledge and experience to provide for all the points essential to success. All of these failures can be traced to perfectly preventable causes, and, when rightly judged, they serve as landmarks to point the safe way.

An Interesting Locality.

"The Line City" is the title given the town of Nogales, Arizona-Mexico, which occupies the unique distinction of lying in two different countries—the United States and Mexico. It is on the extreme southern edge of the frontier, in Pima county, Ariz., part of the "Gadsden Purchase" in 1853, and from a mining point of view is an important place, being the gateway through which passes considerable of the traffic between the mining regions of Arizona and the State of Sonora, Mexico. Through the town runs "the international line," as depicted in the picture on the front page, for which we are indebted to the courtesy of Mr. A. T. Bird, of the Oasis, of Nogales. North of the line is United States territory, south of it lies the Mexican Republic. On this page are given two additional views—one of Nogales, Sonora, Mexico, the other of Nogales, Arizona.

View of Nogales, Arizona.

The Selection of a Working Process.*

By Charles M. Fassett.

A few years since a professor in one of the German universities said to an American mining engineer, who was telling the professor of gold being found in galena, "It cannot exist." He was an old man and has since died, leaving an undying name on account of his discoveries in the science of metallurgy; but with all his learning and lifelong research he could not believe possible the existence of gold in a combination now familiar to everyone. No one thought it possible that precious metal could live in sandstone until Silver Reef was discovered; no one believed gold could exist in porphyry until Cripple Creek was found; and now that we know gold is being profitably extracted from such improbable materials as mica schist, hornblende, and granite, the conservative man will be careful not to say that it cannot exist in basalt, lava, or any other rock, and we may all have to fall back upon the unscientific but extremely safe old California dictum: "Gold is where you find it."

Starting then from this point, and after having found it, the question arises: How shall we get the metal from the rock and put it into shape for utilization for minting or the arts. The great bulk of gold produced to-day is obtained by the use of stamp mills and amalgamation, in many instances supplemented by various processes for extracting the residue of precious metal from the tailings. This is the cheapest method of extraction known and is limited in its use only by the condition of the gold as to its being free or combined with, or entangled in, base combinations. No ore is absolutely free milling, nor is any gold ore entirely base; every ore containing notable quantities of gold will yield at least a part of its value to mercury, and this process should always, in my opinion, receive the first consideration in settling the problem of a working method. If you can obtain half the value on the plates it is reasonably certain that enough more can be obtained by subsequent treatment on the ground, either by concentration, cyanidization, chlorination or pan amalgamation, to render this process the most available.

Smelting is the oldest, the best known and the most generally applicable method of ore reduction now practiced. If ores could be smelted as cheaply as they can be milled, it is safe to say that this would be practically the only process in use in the world to-day. It is essentially a chemical process—a breaking up and reuniting of the molecules of the ores, fuels and fluxes, by the aid of heat—and distinct from the essentially mechanical process of milling. It is interesting to the chemist to note that while a complete analysis is absolutely necessary to determine the proper method of fluxing a smelting ore, it is of little or no use when applied to a milling or other physical process. The adaptability of an ore for treatment by a chemical process is determined by its chemical analysis; for a physical or mechanical process, by physical tests.

I need not consider the smelting process at length, as in its relation to the owner of a developing mine it is simply, on account of its expense, a temporary expedient or a last resort. Nine-tenths of the smelting is done at custom works, run independently from any mine, and, from the very conditions surrounding the industry, it will continue to be conducted in this manner except in infrequent cases. The cost of smelting a neutral ore is not great, but when combined with the usual extra charges on detrimental constituents and railroad freights, it often amounts to a prohibition.

Competition and improved processes, however, have greatly cheapened this process in late years, and made it possible to ship ore at a profit from mines heretofore unavailable. Within the past fifteen years I know of a smelter in Nevada where $24 per ton was the treatment charge, and they paid only 62½% of the value of the silver and 95% of the gold at $20 per ounce. How many of you who are now shipping ore could do so under such a tariff as this?

Matte smelting, and pyritic smelting, in which process the sulphur in the ore furnishes the greater part of the fuel, are concentration methods of great utility and will always be used in remote districts where transportation charges on the crude ore are prohibitory, and mechnical concentration inapplicable. The cost of a plant is not great, and the cost of treatment is low if a proper mixture of ores and good fuel are available; but the very highest skill is demanded both in the construction and running of such works, and owing to the comparative newness of the process, such skill is not readily available.

Mechanical concentration is often practiced on smelting ores, and its utilization has brought millions of wealth into circulation that otherwise would be still lying idle in low-grade rock. It is a boon to the miner, saving freight and treatment charges on waste and detrimental material, making a valuable and much sought product of an ore which in its crude state would be hard to treat.

If you have a mine which is in a condition to produce ore in sufficient quantities to justify the erection of a mill, the first thing to be done is to obtain a sample of ore which will represent, in its assay, value and principal characteristics, the ore that you will be able to mine. This is the most important and, perhaps, the most difficult thing to do. It is utterly foolish to go to the expense of having working tests made on your ore unless you can produce ore in sufficient quantity and can take a representative sample. It seems unnecessary to say this, but the Pacific coast is dotted with expensive evidence that these conditions have not been fulfilled. When you have obtained your sample and assayed it (it should weigh 100 to 500 pounds), try these processes, beginning with an amalgamation test, and when you have found a method that seems most available, go back to it and try it over and over again, varying the conditions in every way you can think of, such as fine and coarse pulverization, concentration before and after milling, etc. Experiments made carefully on small quantities of ore will be found of great use in determining upon a process, and in many cases will tell you very closely what can be expected on a large scale. Send part of your ore to the smelters, and to any crazy scientist whom you may hear is working on a new process. Take time to let them all have a trial at it, and remember that, as no two ores are alike, yours may be just the ore that is adapted to some embryotic method that will treat it successfully. When they have solved the problem the world sees the dazzling light of genius in their eyes.

When you are ready to build a mill, get the best man you can find to design it for you. It is always economical. Don't buy any piece of machinery because it is cheap; wait, if necessary, until you are able to buy the best, for I can say to you from bitter and expensive experience, that it is folly to expect good results from poor practice. Maybe your ore is good enough to stand expensive mistakes in your equipment, but the time comes in the history of every mine when profits can be had only by the most careful and economical management of the best possible equipment. Above all, don't build the mill until you have the mine. Keep in mind the first step in the old recipe for preparing a rabbit pie: "First catch your rabbit."

*Condensed.

Refining California Petroleum.

In obtaining refined products from native crude oil, the first step consists of placing the crude oil in large, hollow, cylindrical stills, enclosed in and supported by brickwork and suspended over large furnaces; heated by liquid fuel above the boiling point, the vapors rise from the surface of the oil, entering large iron pipes immersed in water, passing through these pipes condensed in liquid form and emerging from the pipe as a distillate.

In this first process of distilling, different sections of the oil are separated into series. Those that come off of the still first are lighter in weight and in color, and have a low boiling point. As the process of distilling goes on, the boiling point continues to rise, until it requires several hundred degrees of heat to lift the vapors out of the still. The products now obtained are crude distillates, on the one hand, and the part remaining in the still is refined asphaltum. With some refiners this is all that is done in the handling of the crude oil, and the sales are made of the refined asphaltum, and the crude distillates—whose value is only a little above that of crude oil.

A complete refining plant is equipped with a large number of tanks, in which these various divisions of the oil are stored, and taken from them separately, and, by being excluded from the light and carried through a process of cleansing by the use of sulphuric acid, alkali and water, and again put through the process of distillation for the final separation, made ready for the particular use to which they are adapted; other portions are exposed to the sun and air and rain and left in the open tanks for some time to effect the curing and ageing process, which renders them more susceptible to the action of the acids, alkali and water in the purifying process. These oils are finally finished by filtration so as to remove from them anything of a foreign nature that is not an oil perfect in form and color.

The lighter oils are those that are treated in such a manner as to exclude them from the light, and are calculated for use as illuminants, or as oil for power use in generating power in distillate engines. While the article supplied by the refineries for use as generative power is termed distillate, it is, in fact, a refined oil, and as much pains and skill is required to produce a satisfactory gas engine distillate as is necessary to produce a satisfactory burning oil for domestic use.

The other class of oils is intended for lubricating, and the process of preparing them for market requires considerable time and a large number of tanks, as the oils have to be changed from place to place as they pass through the various cleansing processes. When finished, these oils are nearly odorless, and have an appearance far removed from that of the crude oil.

When crude oil is divided up into its various components and hydrocarbons, the colors in the finished oil show all the colors of the solar spectrum, starting with the white and ending with black.

◆

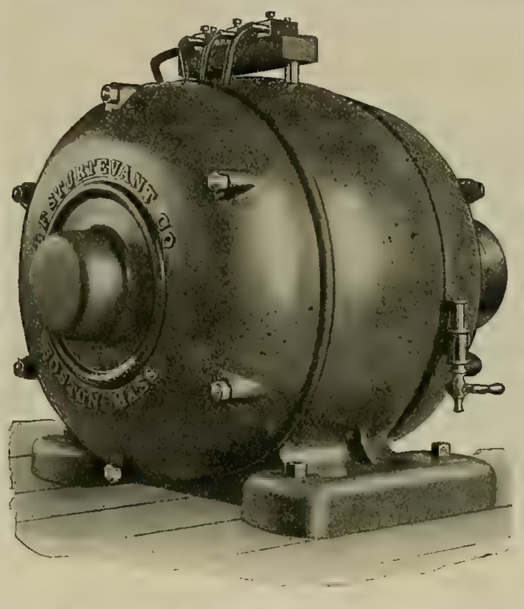
By the duplex system of telegraphy two operators can transmit simultaneously in opposite directions. This is attained by winding the receiving relays with two coils of wire in opposite directions, one winding being connected to the line and the other to a set of resistance coils and condensers which are so adjusted that the electrical length and static capacity are the same as the real line. The home power divides equally, half passing around the core in one direction to the real line, and half in the opposite direction to the artificial line, the result being that the core is not magnetized by it, and it is not susceptible to the home power. As the power coming over the line from the distant station only passes through one of the coils, and there is none coming in from the artificial line to counteract it, the core is affected by any change in power at the distant station. The receiver is a polarized relay whose armature closes the sounder when moved in one direction, and opens it when moved in the other. The transmitter is an instrument worked by an ordinary telegraph key and local circuit. It is so arranged that when the key is depressed the negative pole is connected to the line, and when positive the key is opened.

◆

Concerning the article in the issue of the 13th inst., on the formation of lode matter, it may in general be said that whatever be the facts in any particular case regarding the present deposition of minerals, it is manifest that the chemical changes of the earth are constant though varying in degree, and that though at this time the formation of new mineral deposits is perhaps less active and confined to fewer localities than has been the case at other periods of time, they are still forming. It is, however, probable that these formations are more largely observed in old mines which are being reopened by unwatering and that the mineral simply accumulates locally. One instance is that of a mine in the Joplin, Mo., lead belt, which laid idle for some years, and, upon being unwatered about two years ago, presented some interesting examples of secondary accretion. Large cubes of galena had during the period of the mine's abandonment been eaten away, and tiny cubes of the same material had formed upon the surface of them. There are also, doubtless, instances where minerals are dissolved at one point and redeposited elsewhere, more or less remote; but, as a whole, that is a period of rest, and it is doubtful if more than isolated cases may be cited where minerals from which the ores of the metals are obtained are depositing with any degree of even geological activity. The epoch in which the Comstock and other large mineral deposits were formed is referable to a remote period of time with which the present period of deposition bears but poor comparison.

Enclosed Electric Motor.

Herewith appears an illustration of a bi-polar type of enclosed motor, manufactured both as a motor directly connected to a propeller fan and as an independent machine. For the former purpose it is used on all sizes of fans up to and including the 54-inch. For larger sizes the four and eight pole types are employed. As will be observed, the motor is entirely enclosed, and thus protected from dust. A low temperature rise can be maintained without greatly increasing the size and weight above that of the ordinary open type. The machine is capable of continuous operation for ten hours, with a maximum temperature rise not exceeding 60° F. Yokes extending out from the field ring support the armature shaft. The end casings are independent, and can be instantly removed to give access to the entire interior. The bearings and brushes can be reached by removing the caps in the center of the casings. The brushes are of hard carbon, in holders of a modified reaction type, which allows of easy adjustment when it becomes necessary to reverse the direction of rotation of the motor. The bearings are self-oiling and self-aligning, and are fitted with composition sleeves, removable from the outer ends of the boxes. These motors, in sizes from $\frac{1}{6}$ to 5 H. P., are built by the B. F. Sturtevant Co., Boston, Mass.



The Cazo Reduction Process.

The treatment in reducing silver ores, known as the Cazo process, was invented by A. Barba in Peru, and from there introduced into Spanish possessions in America, including Mexico. It is a simple amalgamation process considered adapted for native silver, chlorides, bromides, and iodides of silver, which are treated in hot solutions by this method. The Cazo kettle or boiler consists of a wooden tub with a bottom made of a spherical segment of copper about 2 feet in diameter. The wooden board or tub is jointed to it by means of copper rivets. The Cazo or boiler is placed on a furnace and contains from 200 to 300 pounds of finely pulverized mineral, each charged together with from $\frac{1}{5}$ to $\frac{1}{10}$ of salt and water sufficient to form a liquid paste. The man in charge of the operation keeps a slow fire to produce a low boiling temperature, and adds from time to time small quantities of quicksilver. The chlorides and bromides of silver are dissolved in the solution of salt and are decomposed by the copper of the kettle. The reduced silver amalgamates itself with the mercury. The object of adding the mercury only a little at a time is in order that the chlorides and bromides of silver be reduced by the copper and not by an excess of mercury. The man in charge of the operation stirs the mass constantly by means of a ladle. From time to time a sample of the amalgam is taken from the bottom of the kettle, and when it has the appearance of lead filings the operation is completed. This takes place generally in about six hours. Then the charge is taken out and a new one put in its place, and when a sufficient number are obtained they are put together, the amalgam washed and strained, and the quicksilver distilled to obtain the silver. The loss in quicksilver is variously estimated from 2% or 3% to a weight equal to that of the silver recovered.

Sometimes this method has been employed with minerals containing silver sulphurets and sulphide, but then the minerals have to be previously roasted with salt. The roasting must be carried on sufficiently long to decompose and volatilize the greater parts of salts of iron and copper, otherwise the loss of mercury would be excessive. The practice in Mexico generally is to use two parts of mercury for each part of silver, but experiments carried out on a large scale by Becquerel Bros. and M. Dupont shows that by using four or five times as much mercury per unit of silver a greater amount of silver is recovered. The relative value of silver and the loss of mercury necessary to obtain a certain increase regulates the proportion of the two metals.

According to M. Dupont the amalgam obtained by the Mexican process has for its formula Hg^2 Ag, whereas by increasing the use of quicksilver he obtains amalgams with a formula of Hg^4 Ag. If a great excess of mercury is used it will combine with the copper of the Cazo and will be lost for amalgamation with the silver, whereas a small excess is not detrimental, because the reduced silver will keep the walls of the copper kettle clean. At all events the quicksilver must be added in small doses.

Regarding the quantity of salt to be used in this process the solution of salt employed should have a density of from 15° to 20° Beaume. When the proper minerals are used in this process the silver obtained is 995 fine. M. Dupont has applied this process to nearly every variety of silver ores by preliminary roasting, Becquerel Bros. have used it in the treatment of silver galenas.

The Fatigue of Metals.

In discussing crystallization of iron and steel under shocks and vibrations, one important factor which destroys the best metal when subjected to long-continued shocks is ignored or passed over, while the secondary effect of this cause, the granular appearance of the fracture, is given attention. The factor thus forgotten is the ability of a beam, an axle, or a stamp stem to conduct vibrations speedily away from the point of impact, and distribute the motions thus caused uniformly and uninterruptedly from particle to particle through the mass of the metal during the longest possible period of time without fatiguing the metal. This immediately raises the question, "What is fatigue of metal?" a question more easily asked than answered. One must be a little arbitrary in conception of the term and nature of the fatigue of a metal that he may have something tangible to start on.

We all know, speak and reason about the conductivity of a metal, by which is understood its property to transmit heat or electricity through its mass with greater or less facility, according to its nature, whether it be a good or bad conductor. Given a metal known to be a good conductor of heat, for instance, we know that, other things being equal, its conductivity can be impaired in various ways—by flaws, impurities, hollow spaces, irregularities in outlines, want of uniform density, etc. The heat impinging against the metal not being conducted away readily on account of the obstacle encountered in the shape of any of the defects mentioned, it follows that at or near the point of contact of metal with the fire the metal becomes hotter than it would if conductivity were unimpaired. The greater the impairment the greater the heat, and the more frequently the heating is repeated the more speedy will be the failure of the metal thus abused.

On the other hand, supposing a metal to be an ideal conductor, it stands to reason that in the course of time a period will ensue where the particles are not as responsive, as ready for work as they used to be; that is, the metal becomes worn out, and will readily break at the weakest point.

In speaking of conductivity, one fancies in his mind the heat striking first the extreme outer layers or layer of a metal, and, by virtue of the close contact of its particles, traveling from particle to particle until the end or other side of the metal is reached. As a matter of fact, one can feel or in other ways observe this movement of heat along a bar of metal. Motion imparted to a structure, or part of a structure, will be and is transmitted from particle to particle in a similar way as heat or electricity. That is to say, motion imparted to a piece of metal at the point of contact will cause vibration of the molecules, but the vibrations thus set up must travel along the various points of contact of the crystals or fibers, and hence is subjected during its passage from one end of the metal to the other to the same influences as is heat or electricity.

If there are impurities, flaws, irregularities of structure, unequal density, motion will be retarded, deflected or arrested, just as a cracked bell will give no ringing sound because the crack has broken the continuity of the metal, and the vibrations produced by striking the bell are arrested by the crack in their onward movement.

It is also reasonable to assume that in the case of inequalities in the metal of one kind or another certain portions of the structure—beam, axles, stamp stems, etc.—are more severely affected by the motion than the rest of the metal, because certain portions are less conductive or less able to carry the vibrations along. One can imagine this to take place in a manner analogous to a weight unequally distributed. When equally distributed a body may be amply able to carry it, but will break down if the weight is put on one point only.

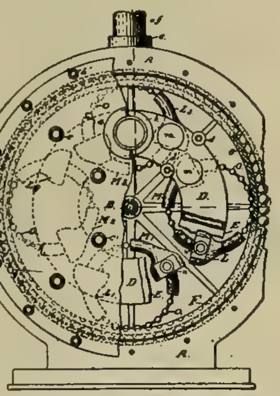
Likewise, if the force of impact remains the same for a partly defective metal as for a perfectly sound one, the sound portions in the defective metal must necessarily be taxed more than if the whole of the metal was sound. But even if perfect in every particle, it is natural that vibrations many times repeated must eventually produce a deteriorating effect, since there is nothing of artificial creation which is indestructible. When that point of deterioration in a piece of metal subjected to repeated vibrations is reached where, even in the soundest piece of metal, the motion wave is not carried along as freely from particle to particle as originally, then one may conceive the metal to be what is called fatigued—tired, in a state of weariness, inability to respond with its inherent strength. What the actual condition and nature of a piece of metal is when it is fatigued probably no metallurgist is able to describe or knows. We may, however, assume that fracture of metal in ordinary service must be preceded by an initial separation of the particles at their points of contact, and this initial separation must be preceded likewise by a loosening of the particles, a relaxation of the force of cohesion.

Mining and Metallurgical Patents.

Patents Issued October 9, 1900.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

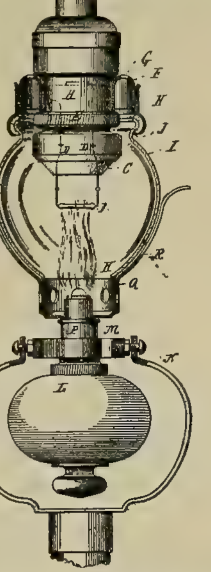
STEAM MOTOR.—No. 659,219; J. H. Fedeler, New York.



Combination in steam or water motor of one or more piston rings or series of balls with wheel F, pipe M connected to pipe y by nut S.

◆

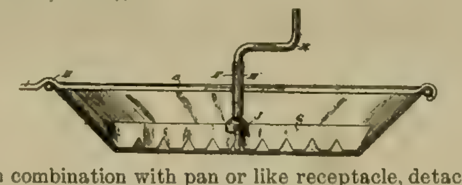
GLOWER HEATING APPARATUS FOR ELECTRIC LAMPS.—No. 659,268; J. Van Vleck and W. N. Stevens, New York.



In an electric lamp of type specified, glower cylindrical support therefor, arched or bent over ring F, upon support provided with openings G, and secured upon ring globe L having opening K, inclosing glower fixed sleeve surrounding glower and portion of support open to atmosphere at top and bottom deflecting surface immediately above glower; whereby heating flame introduced at bottom of sleeve will impinge upon glower and deflecting surface and thereafter pass off through annular space between sleeve and support.

◆

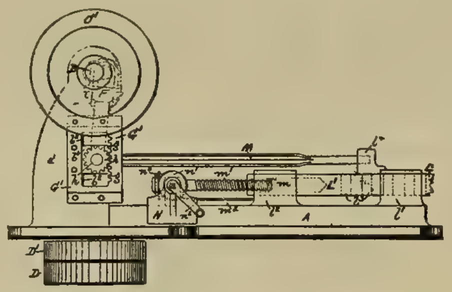
MINER'S SEPARATING PAN.—No. 659,237; A. J. Ketelsen, Chicago.



In combination with pan or like receptacle, detachable separator adapted to be supported upon pan and projected thereinto comprising brace bar having hooked end adapted to engage one end of pan and offset portion adapted to engage opposite end of pan, extended portion constituting handle of offset end of rod, magnetic separator blades supported centrally of bar adapted to project into pan and means for agitating blades.

◆

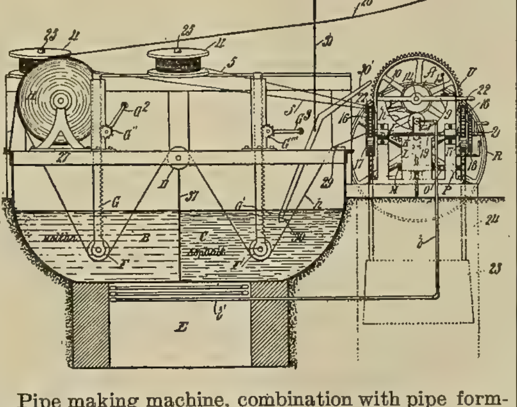
MACHINE FOR SHARPENING ROCK DRILLS, ETC.—No. 659,371; W. E. Kimber, Johannesburg, South Africa.



In combination frame comprising base plate A, vertical sides a a′, driving shaft B mounted in bearings in upper ends of sides a a′, flywheels C C′, fast and loose pulleys D D′, vertical recesses formed in sides a a′, blocks b b′ arranged to slide therein, liners b^2, roll E, fitted with detachable die e corresponding to cutting face of drill to be sharpened and with its extremities projecting through blocks b b′ to outside of sides a a′, connecting rod F, formed with two arms f f′ loosely embracing turned down ends of roll E to inside of blocks b b′, plates G G′ fixed to outside of vertical members a a′ constructed with an open center, rack or teeth g formed on inner front vertical edge thereof, stationary plate H arranged in from of roll E secured to sides a a′ formed with central aperture or opening for drill and with radial slots countersunk along radial edges, corresponding in number to wings of drill opening into central aperture i, holders and centering devices i′ fitted within radial slots formed with shoulders i^2 on two opposite sides to fit countersunk radial edges of slots, constructed hollow or concave at extremities to correspond to convexity of outer edges of wing of finished drill, projection k formed on extremities of holders i′ and projecting beyond surface of plate H at back to prevent metal of drill being rolled beyond desired point, projections j formed on holders i′ on inside, disk J provided with curved eccentrically disposed slots corresponding to holders i′ into which projections j project, lever K attached to disk J for rotating it in either direction, cap or cover L attached to plate H for holding parts in position, guides l′ l^2 formed on base plate A, bar L′ formed with holes l^3, stop l^4, for shank of drill, nut m fitted in forward end of bar L′, screw m′ traversing nut m, bracket m^2 supporting other extremity of screw m′, bevel wheel n^3 secured to end of screw m′ beyond bracket m^2, bracket N fixed to base plate A formed with boss n, spindle rotating in boss n, handle n^2 connected to one end, bevel wheel n′ to other, bevel wheel n′ gearing bevel wheel n^3, for supporting drill endwise and feeding drill forward while being sharpened.

◆

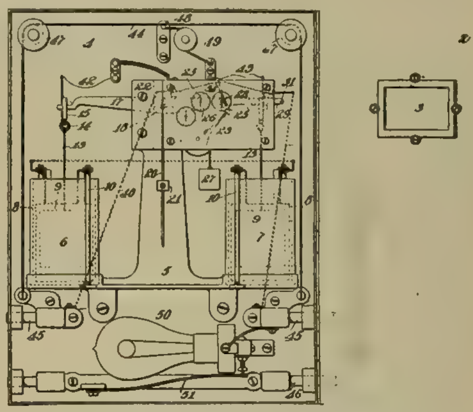
PIPE MAKING APPARATUS.—No. 659,437; A. S. Dixon, Los Angeles, Cal.



Pipe making machine, combination with pipe forming mandrel; compressing roller mounted in ways beneath mandrel; screws at ends of roller for moving roller up and down; sprocket nuts for supporting raising and lowering screws; chain driving sproket wheel provided with means for rotating same; sprocket chain led around sprocket nuts and around sprocket chain driving sprocket wheel.

◆

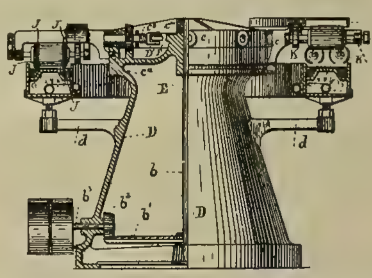
ELECTRIC METER.—No. 659,389; T. A. Edison, Llewellyn Park, N. J.



In an electric meter, combination with balanced scale beam, and two electrolytic cells, movable electrodes of which are connected to extremities of scale beam, a register train, escapement operated thereby controlled by oscillation of scale beam, movable contact operated by register train at each movement of escapement, two fixed contacts with each of which movable contact successively engages, divided resistance shunting both cells, connection between center of such resistance and movable contact, whereby current will be successively reversed through both cells.

◆

MEANS FOR APPLYING FLUID METALS.—No. 659,380; W. H. Smyth, Berkeley, Cal.



Can soldering machine comprising endwise clamp can carrier adapted to effect axial rotation and travel of can, its axis horizontal, solder bath, means for applying solder therefrom to can, hood above path of soldered can provided with air inlet whereby current of air is directed upon the can while still grasped by clamps.

◆

FLASH POWDER.—No. 659,331; A. Weiss, Strasburg, Germany.

As a new article of manufacture, a flash powder for use in taking photographs by artificial light, consisting of a mixture of powdered aluminum and powdered perchlorate of potassium, in proportions substantially as set forth.

◆

PROCESS OF EXTRACTING ZINC AND COPPER FROM THEIR ORES.—No. 659,338; C. G. Collins, New York.

Process of treating ores of copper and zinc, and other metals soluble only in strong solution of solvent, which consists in immersing comminuted ore, in solution containing sodium sulphate and bisulphate (niter cake), in proportion to contained copper and zinc therein, sufficient in strength to dissolve only copper and zinc therefrom, and subsequently recovering these metals from solution.

◆

PROCESS OF EXTRACTING COPPER AND ZINC FROM THEIR ORES.—No. 659,339; C. G. Collins, New York.

Introducing the comminuted ore into a solution of sodium sulphate containing hydrochloric and sulphuric acid not exceeding 5° Baume, subsequently recoving these metals from the solution.

◆

AT St. Paul, Minn., on the 14th inst., Henry Floyd claims to have tramsmitted 30,200 volts of electricity through an underground cable 3 miles long. The cable consists of three copper conductors, each about the size of an ordinary lead pencil, each being inclosed in a paper tube, the whole incased in a lead sheet and drawn through vitrified clay conduits. The cable is part of the system by which the St. Paul Gas Light & Power Co. will utilize the water power at Apple river, Wis., the other 24 miles of wire being overhead.

◆

THE Census Bureau at Washington sent back the papers to their Trinity county, Cal., man and hauled him over the coals for not making returns on the factories in his district, as they had received word that "the Adele Co. was making 100 tons of cement per day at a place called Lewiston." The original reference was to the handling of cement gravel and extraction of gold therefrom.

Machine Mine Rock Drills on the Pacific Coast.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS
by A. E. CHODZKO.

In concluding this review of the rock drills used on the Pacific coast, a few general considerations concerning the economical side of machine work will not be out of place, assuming, for instance, the case where a certain length of tunnel or drift is to be excavated and taking it for granted, which is no exception, that the men in charge are experienced miners, i. e., that they place their holes to the best advantage as regards the ground formation, and consequently that the amount of explosive used is a minimum under the circumstances.

The total cost of the work, besides this element, will consist, for each rock drill used, of three principal items, namely:

First—Cost of the compressed air consumed by the machine, including : (a) cost of motive power ; (b) supplies and maintenance ; (c) attendance.

Second—Wages of miner and helper.

Third—Cost of repairs.

With reference to the cost of compressed air, it is obviously desirable that each machine should use the least possible amount of air to do a certain work, and this result can be attained in two principal ways, applied singly or in combination, namely: By having the valve motion arranged so as to avoid unnecessary cushioning at the usual piston stroke, or, in other words, so as to deliver as powerful a blow as consistent with the size of the cylinder and the air pressure. Also by reducing the clearance, which in many rock drills represents a very high percentage of the total capacity of the cylinder.

This reduction in the quantity of air consumed by each machine amounts to saying that either the time of actual running of the compressor will be reduced, or else that more rock drills can be operated with the same compressor.

The importance of this cost of compressed air may vary in different places. There are such cases, for instance, where a mine is using its own system of water power, and where the compressor is started and stopped automatically. The running expenses would then vary but little with the air consumption ; the supplies item alone would be affected thereby, and a wasteful type of drills would merely require the purchase of a larger compressor at the start. This, however, represents an exception, and in a majority of cases a reduced air consumption is a desirable feature of a drill.

Second—Wages of miner and helper. This part of the cost is in direct proportion to the time, and the desirability of a machine delivering a powerful blow, i. e., drilling in a given time a maximum length of hole, is evident.

Third—Next comes the cost of repairs, which is not necessarily in proportion to the time of operation of the machine. It will be readily understood that, if it is doing heavier work during fewer hours, the cost of repairs may be the same or even higher than if the drill is working more leisurely during a longer time.

Without referring to any specific figures, it may be noted that should the average cost of repairs per day equal the amount of wages paid to the men in charge, seven new machines could be purchased every year for the money required to keep one of them in repair, a state of affairs which few miners would be likely to accept.

It is, therefore, safe to say that, for all possible reasons, economy in rock drilling means rapidity. But, passing from general considerations to precise figures, one instance might be quoted, among others, with reference to a large mine where an exact account was kept of the actual cost of drilling, with the following results, the miner being paid $3 and the helper $2.50 per day:

	Per cent.
Power	23.1
Wages	74.1
Repairs	2.8
Total	100.0

This shows that it is an erroneous, though not uncommon, view to state that the cheapest machine is the one which costs less to keep in repair. In the large tunnel enterprises where rock drills were first used this point had been so well understood that in many instances they would not even go to the trouble of repairing a disabled drill; it was simply thrown aside and a new one put in its place. It is safe to say—and the writer can tell it from personal experience—that the machines were worked for all there was in them, and when they failed they were really fit for the scrap pile. To make time at any cost was the only motto, and, under the circumstances, the right one. It would probably be carrying things too far to apply the same process in a mine where a few rock drills only are in operation; but the principle remains the same, namely, that the most economical machine is the one that will drill the greatest length of holes in a given time. Power of action and, if possible, reduced air consumption are, therefore, the two points to be borne in mind when selecting a machine drill.

(TO BE CONTINUED.)

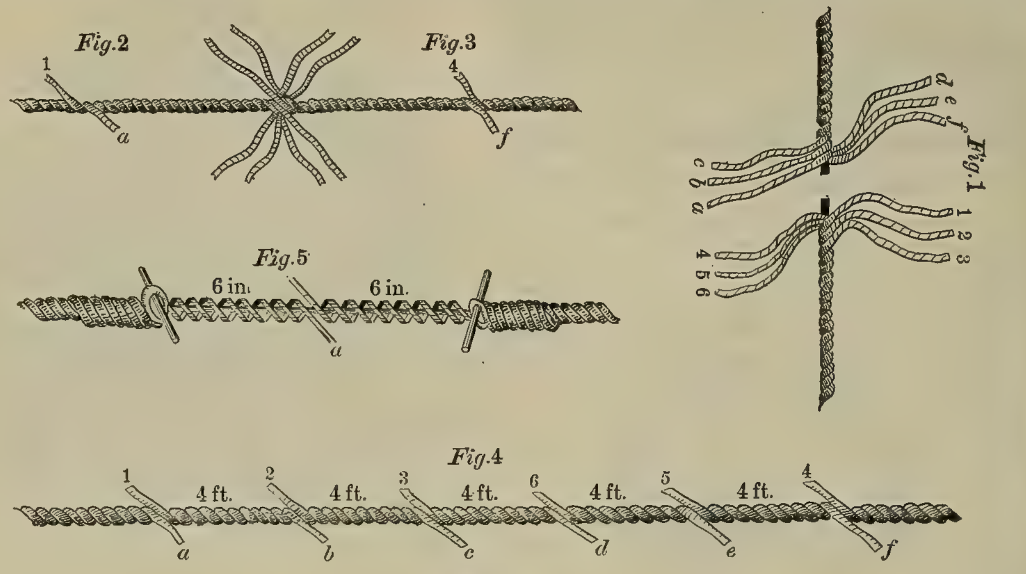
Splicing Wire Rope.

In the issue of Sept. 29 appeared an illustrated article on "How to Splice a Wire Rope." The matter is of sufficient interest to warrant further notice. The annexed is a way recommended by John A. Roebling's Sons' Co., manufacturers of wire rope, Trenton, N. J.:

Directions for making a long splice in an endless running rope of ½ half inch diameter: Tools required—One pair of nippers for cutting off ends of strands ; a pair of pliers to pull through and straighten ends of strands ; a point to open strands ; a knife for cutting the core and two rope nippers, with sticks to untwist the rope ; also a wooden mallet.

First—Haul the two ends taut, with block and fall, until they overlap each other about 20 feet. Next open the strands of both ends of the rope for a distance of 10 feet each ; cut off both hemp cores as closely as possible (see Fig. 1), and then bring the open bunches of strands face to face, so that the opposite strands interlock regularly with each other.

Second—Unlay any strand (a) and follow up with the strand 1 of the other end, laying it tightly into the open groove left upon unwinding a, and making the twist of the strand agree exactly with the lay of the open groove, until all but 6 inches of 1 are laid in, and a has become 20 feet long. Next cut off a within 6 inches of the rope (see Fig. 2), leaving two short ends, which must be tied temporarily.



Splicing Wire Rope.

Third—Unlay a strand (4) of the opposite end and follow up with a strand f, laying it into the open groove, as before, and treat it precisely as in the first case (see Fig. 3). Next pursue the same course with b and 2, stopping, however, within 4 feet of the first set ; next with e and 5 ; also with c, 3 and d, 4. We now have the strands all laid into each other's places, with the respective ends passing each other at points 4 feet apart, as shown in Fig. 4.

Fourth—These ends must now be secured and disposed of, without increasing the size of the rope, in the following manner: Nipper two rope slings around the wire rope, say 6 inches on each side of the crossing point of two strands. Insert a stick through the loop and twist them in opposite directions, thus opening the lay of the rope (see Fig. 5). Now cut out the core for 6 inches on the left, and stick the end of 1 under a, into the place occupied by the core. Next cut out the core in the same way on the right, and stick in the end of a in place of the core. The ends of the strands must be straightened before they are stuck in.

Now loosen the rope nipper and let the wire rope close. Any slight inequality can be taken out by pounding the rope with a wooden mallet.

Next shift the rope nippers and repeat the operation at the other five places.

After the rope has run for a day the locality of the splice can no longer be discovered. There are no ends turned under or sticking out, as in ordinary splices, and the rope is not increased in size, nor appreciably weakened in strength.

The foregoing rules apply only to ropes with hemp centers. Ropes with wire centers may be spliced in same manner as hemp ropes by putting in long splice.

◆

MINING is the noblest of industries. From it all cruelties of competition have been eliminated. In the wake of the successful miner destitution, despair and death do not follow—his enrichment does not mean another's impoverishment. The miner delves into the earth and brings forth something which adds to the comfort, happiness and wealth of the world—he is a producer, and the world stands ready to buy his product. Gold mining is the only industry of magnitude that is not directly under the domination of trusts and monopolies. It defies the manipulation of politicians and is one industry to-day which offers a fair return for money invested and labor expended.

Movement of Ground Water.

The amount of water stored in saturated soil—that is, below the ground water surface—is, in round numbers, two-fifths of the whole bulk. Usually three-quarters as much is to be found even in soil above the plane of saturation, except during dry times in a surface layer 1 to 5 feet thick. Saturated sandstone may contain as much as 38% in bulk of water, equivalent to immense and deep lakes in widespread and level-lying areas of sandstone. Even compact marbles and granites contain an appreciable percentage of water. It is probable that water penetrates the earth's crust in some degree to a depth of more than 10,000 feet.

Consolidated and deep-lying rocks have, in growing compact, lost much water. Fine silt deposited in water contains more than half its bulk of water, but, on compression by overlying sediment, part of the water is driven out, either upward, downward or sidewise. Evidently, vast quantities of water must so have been expelled from the enormous masses of rock that now underlie mountain regions, much of the rocks at present having less than 1% of pore space. Such water-bearing sediments, when carried down several thousand feet, must in higher temperature expand and drive out water in some direction, the water flowing much the more readily from its lessened viscosity at a higher temperature. The gradual deposition of mineral matter from the stationary film of water around the grains of a standstone, and the conseqquent absorption of other mineral matter by the film from neighboring circulating water, and again the deposition of this absorbed material, until the rock becomes much more compact and less porous, must occasion the expulsion of great quantities of water in the case of vast bodies of rock. The consolidation of 50,000 square miles of sediment 1000 feet deep, with an original pore space of 33% reduced to 3%, must require the expulsion of a sheet of water 50,000 square miles in area and 300 feet deep, and its replacement by solid rock material—enough material to take the Mississippi river 60,000 years to supply, even with 150,000,000 tons carried in solution annually to the sea. Such subterranean movements of water are extremely gradual, lasting through long periods of time.

Effect of Drouth on Boilers.

Some of the causes which contribute to produce variations in the amount of scale formed in a boiler in any specified time are often overlooked. The amount of rainfall during the season has a direct bearing on the scale formation, though few steam users would think it possible.

Unusual deposits of scale are generally due to an increased hardness of the water, when the supply must be drawn from the lower strata where it has become impregnated with lime and magnesia. On the other hand, in seasons of heavy rain the surface water, which is much softer, is largely used, the proportion of scale being smaller.

From this it can be seen that during a dry season boilers should be cleaned more frequently, and an inspection should be made about twice as often as before. During a time of abundant rainfall a general loosening of the incrustation may be expected, and its lodging over the fire sheet should be guarded against.—Locomotive.

MINING SUMMARY.

ARIZONA.

GILA COUNTY.

The second furnace increases the Old Dominion copper output nearly 800,000 pounds per month.

MOJAVE COUNTY.

(Special Correspondence).—The strike in the White Hills mines is considered important, as showing that there is a second mineral zone at the comparatively shallow depth of 600 feet. The rich ores of this camp were seemingly exhausted at 300 feet, little ore being found below that level. To all appearance, after producing several millions of dollars on the surface, the mine played out, and from being a lively camp, affording work to 500 men, it dwindled to a small prospecting outfit of fifteen men, which the company in control has kept at work for the past year. The new discovery, however, has rejuvenated the old camp. Already fifty men have been put on and more are to be added. Bullion is being shipped and the mill is running steadily. The ledge in the new find is from 1 to 3 feet wide.

W. B. Scott of Chicago has put twelve men at work on his claims near the summit of the River Range, on the El Dorado canyon road. Mr. Scott paid $12,000 for the property, consisting of six claims. In one shaft is 4 feet of ore running $25 in gold. The river is 7 miles to the west and all down hill.

The Maguire gold mine, 3 miles from Kingman, employs six men. Water has been found in great quantity and the work of erecting a mill will soon begin. The Huntington mill people, who are interested, will put in one of their 60-ton mills.

Kingman, Oct. 14.

At Chloride W. Miller, Supt. Connor-Minnesota group, has men in the lower drifts enlarging and developing. The concentrator is being put in condition for work.

PIMA COUNTY.

F. Guerra, in Ajo district, will develop the property of the Papago M. Co. of Los Angeles. It is a concentrating proposition, low grade and extensive.

The St. Louis Copper Co. is expected to resume work upon the return of A. J. Shotwell.

PINAL COUNTY.

At Kelvin, Supt. R. W. Truman of the Ray Copper Co., Ltd., says he will resume work in the mine and will need first-class machine men and miners; wages $3.50 for first-class miners.

Blade: Supt. Pheby of the Silver King mine shipped last week another car of silver ore, via Desert Wells, Mesa and Tempe to Selby Smelting Works, San Francisco. These cars go out regularly and the work on this mine is doing much for this section of Pinal county. Returns from a small marked shipment of 1720 pounds of crude ore netted $526.92. The King ore is a gray copper and runs from 800 ounces up in silver and from 23% to 30% copper, 10% lead and about $20 in gold.

YAVAPAI COUNTY.

The cave at the United Verde copper mines, at Jerome, occasioned temporary cessation of work at the smelters. An acre of earth surface caved to a depth of 8 feet.

CALIFORNIA.

ALAMEDA COUNTY.

The Cape Nome M. Co. has incorporated at Berkeley; capital stock, $50,000; actually subscribed, $30,020; F. W. Mesow, $10,000; J. C. Jenson, $10,000; D. Keith, $10,000; R. H. Delafield, $10; N. Larsen, $10.

At Oakland is incorporated the Hotchkiss Co., to operate the process of extracting metals from ores. Capital stock, $50,000; subscribed, $25; E. L. Hotchkiss, I. H. Clay, A. G. Stephens, H. I. Clinton, H. A. Moser.

AMADOR COUNTY.

At Sutter Creek the East Eureka M. Co., a new corporation, has brought suit against the Central Eureka M. Co., claiming $120,000 for alleged trespass, claiming that the Central Eureka has sunk an incline shaft near its east side line, which penetrates easterly under plaintiff's ground, and have taken, and are now taking, ore therefrom. The Central Eureka Co. claims that the apex of the lode is on its ground and has a right to follow it.

BUTTE COUNTY.

The Cortez G. M. Co. has a quartz mine at Red Point Hill, on McCabe's creek. There are ten stamps at work, a rock breaker and concentrator. The company is running a tunnel and following the pay ledge to a paying depth. The company has entered into a bond in the sum of $20,000 with the owner, M. Lathlean of Sutter Creek.

CALAVERAS COUNTY.

A 5-stamp mill is to be built on the McLoud mine, on the Licking fork. The mine has been bonded to a company represented by B. Aiken of Jackson.

Near West Point Supt. Congdon has men at work on the Yellow Aster mine.

The Emery G. M. & W. Co. will begin construction of an electric and telephone line between San Andreas and El Dorado.

D. Fricot will build a telephone line between San Andreas and Fricot City.

Mr. Braunton has the contract to build the Lightner chlorination works.

G. H. Lewis is developing the Duchess quartz mine, 2 miles southeast of Vallecito, owned by Emery & Lilly of Indiana. He has completed a wagon road to the mine, dug 4 miles of ditch and is building flumes and laying pipe preparatory to running an air compressor and drilling machines. As soon as water can be obtained, a 3000-foot tunnel will be driven.

EL DORADO COUNTY.

The new mill built by the El Dorado Water & Deep Gravel M. Co., near the mouth of Silver Fork, is completed.

Nugget: The Church mine has been bonded by C. J. Garland of Oakland. It has been closed for two years. The shaft had been sunk to a depth of 1000 feet and the ore extracted was worked in a 10-stamp mill. A wide ledge of low-grade ore had been encountered, and it was found that it would be necessary to have a larger mill and a heavier hoist to work the mine most profitably. The present operators are unwatering the mine and will increase the plant.

KINGS COUNTY.

At Hanford the Mammoth Electric Co. is organized; capital $5,000,000; A. Guthrie president, J. S. Robertson vice-president, E. Kauntze secretary. The idea is to erect a plant for the development of electric power on the San Joaquin river, 180 miles from San Francisco. J. S. Eastwood, engineer San Joaquin Electric Power Co., has been elected civil and hydraulic engineer, O. M. Lacey of Hanford electric engineer.

LASSEN COUNTY.

The Daisy Dean mine in Lassen county is transferred to L. A. McIntosh for the Daisy Dean M. Co., which was recently organized, in which J. H. Roberts and others are interested.

MADERA COUNTY.

J. M. Day will put a small stamp mill on his mine, the Rex, at Grub Gulch.

MARIPOSA COUNTY.

Among the additions of machinery at the Mariposa mine is the hoisting engine of the Whitlock mine.

NAPA COUNTY.

The stockholders of the Golden Jubilee M. Co. have elected J. C. Steele Supt.

NEVADA COUNTY.

The Nevada County mine is bonded. The mine will be unwatered. The shaft is down 300 feet and will be sunk deeper.

ORANGE COUNTY.

Tribune: The past month was the banner month for the Puente Oil Co'.s refinery in Chino—the output in refined products, illuminating oils, gasoline and engine distillate being about 150,000 gallons, or an average of 5000 gallons per day. The biggest day's shipment was on Tuesday of this week, when twenty-two carloads of refined oil were shipped out by rail, besides a large amount by teams.

PLACER COUNTY.

In the Mayflower, the new tunnel on the upper lead is in 1500 feet; pay gravel is expected in 500 feet more.

Herald: Near Forest Hill, at the Sellier claim, H. T. Bell Supt., satisfactory work goes on.——The Horseshoe Bar Co. is ready for the winter's work.——Buckeye mine owners are grading to put in a stamp mill.——The Big Con. Co. has let a contract to drive the main tunnel ahead from Peckham hill.——Work has been resumed at the Grey Eagle, T. G. Durning Supt.——Near Michigan Bluffs, at the Turkey Hill mine, the dam, ditch and pole line are completed. About sixty men are employed; the gravel averages $3 per car. Wm. Muir is Supt. of the company known as the Boston & South Dakota Con.——At the Webster claim A. Dipple is Supt.——The Prairie Flower at Canada Hill is now under the management of Geo. Payne.——The Canada Hill M. Co. is getting ready for a run, R. Jones Supt.——The Blue Lead M. Co. at Dutch Flat has increased its force and is opening the old blue lead channel; Supt. Jordan has charge.

PLUMAS COUNTY.

Supt. Homan of the Star of Plumas hydraulic mine says that during the dry season men are running a tunnel to strike a deposit of gravel lying beyond the present hydraulic workings. The Star of Plumas is on the forks of Bear creek.

SAN BERNARDINO COUNTY.

The Copper Peak group of mines lies east of the Ord mountains; the shipping point is Victor. The ore is red and black oxide, sulphide and carbonate. The deepest shaft is 6x4, 36 feet, in carbonate which yields 18% copper.

SHASTA COUNTY.

H. A. Cohen expects to have the Bully Hill smelter in operation by Dec. 15.

The Northern California G. M. Co. has incorporated at Redding; capital $100,000, subscribed $75,000; J. A. Kahny $37,350, J. G. Burgbacher $37,350, D. G. Reid $100, C. C. Bush Jr. $100, E. F. Kiessling $100; they intend to operate a mine near Keswick and install machinery on it.

SIERRA COUNTY.

Supt. Mather, at the Plumbago mine, had a September output of nearly $40,000. The new mill will soon be ready.

SISKIYOU COUNTY.

Near Etna the McKeene mine, on Boulder creek, has thirty men doing development work. A new roller mill, with cyanide process, is being erected.

TUOLUMNE COUNTY.

Near Carters the Starr King mine is to have a 5-stamp mill.

Work has been resumed at the Worcester.

Supt. Graham, of the Duleek mine, Big Oak Flat, will put in a 10-stamp mill.

Magnet: The Mazeppa G. M. Co. has been reorganized. President, M. Johnson; vice-president, C. R. Bishop; secretary, J. P. Fraser; treasurer, G. L. Bishop. These gentlemen, with J. P. Pryor, constitute the new board of directors. Work will be resumed at this property as soon as fuel and other supplies can be procured. This company resumes operations with means to prosecute work vigorously.

Independent: At the Jubilee mine a shoot of ore has been uncovered showing considerable free gold. The vein where the rick rock is found is 12 inches wide. There is a 5-stamp mill on the property.——Mr. Houghton of Boston has a company which has started up the Starr King mine, southeast of the Providence.——The Shawmut & Eagle Co. will arrange to increase their mill to 100 stamps. One hundred men will soon be at work on the mine. The company is making extensive improvements and has signed a contract for 1,000,000 feet of lumber.

COLORADO.

BOULDER COUNTY.

M. F. Knight says he will put in a $125,000 electrolytic mill at Wall Street.

Ward Miner: A tunnel is projected to start at Salina and will penetrate beneath Gold Hill, cutting the mineral formations of that locality at a depth of from 1600 to 1800 feet, the length of the tunnel to be 3 to 4 miles.——T. Barnesley has in view the construction of a tunnel 3000 feet long to cut the Caribou at greater depth.——The Little Alice mine has been bought by the Cold Springs M. & T. Co.——The property embraces about 100 acres and mill site at Gold Hill. The Cold Springs management is preparing to install a pipe line for running the mill and operating the entire machinery of the mine.

CLEAR CREEK COUNTY.

Near Georgetown two machine drills are at work in the raise at the Doric mine.

L. Bartholomeo has made a shipment of 300-ounce ore from the Bismarck. Barth & Co. had a mill run which gave returns of 180 ounces silver per ton. O'Connell & Co.'s regular shipment to the mill gave returns of 160 ounces silver. Catterello & Co. made a shipment of ten tons, which returned 375 ounces silver per ton.

At the Joe Reynolds mine, at Silver creek, a tunnel is being driven to cut the lode at a greater depth and afford drainage.

The Monarch M., M. & T. Co., operating the Freeland mine at Idaho Springs, will spend $10,000 upon development work in the Freeland and Toledo tunnels. One of the Freeland levels runs 3300 feet; the other tunnel is 2700 feet long. It is proposed to retimber and extend them. Geo. McClelland of Idaho Springs is general manager. This work is independent of running the 5500-foot tunnel from Clear creek and which will open up the Freeland mine at 3300 feet.

EAGLE COUNTY.

Development of copper prospects near McCoy calls for a 40-ton smelter. The mines already opened can supply sixty tons per day of ores running from 3% to 5% copper.

GUNNISON COUNTY.

The Pure Gold mine, 5 miles south of Gunnison, is to be operated again.

E. A. Stewart is now Supt. Midland mine.

HINSDALE COUNTY.

The Hotchkiss Mountain M. Co. at Hinsdale have the Black Crook mine and right of way through the Golden Fleece tunnel.

HUERFANO COUNTY.

Near Walsenburg the sale is reported of the Ojo M. Co.'s property of five patented claims to Kansas men; consideration $32,500, $5000 cash. On the Ojo a shaft has been sunk 200 feet and drifts run.

At Walsenburg Manager McMullen will use the electric mining plant on the Eagle Plume. The company has twenty-five men at work. Mr. McMullen intends putting in a mill next spring.

LAKE COUNTY.

The Chronicle says zinc shipments from Leadville to European points have ceased; all the product is now diverted to Mineral Point, Wis., and Iola, Kan. When the contracts for foreign shipments expired none of them were renewed; agents for the Mineral Point and Iola plants were ready to take all the zinc that Leadville could produce. The price is a little better than the foreign brokers were paying. The daily total zinc output at the present time is about 200 tons. The Iola works make a spelter of the product, but at Mineral Point a considerable quantity of the product is made into paint. The zinc should be free from cadmium, as this would give the paint a yellow instead of a white color. Several trial lots of zinc have been shipped to a smelting plant at Hamilton, Ontario, for treatment, and the results, if understood, are satisfactory. The ore comes from one of the big dumps at the A. Y. and Minnie, and while the Canadian smelter ostensibly takes it for the zinc, paying f. o. b. Leadville, the plant saves not only the zinc but the lead and silver also.

Wood & Mulrooney will put in a pump in the Greenback mine at Leadville; triple expansion, capacity to throw 1000 gallons of water per minute from a depth of 1100 feet. The pumping station at the 1000-foot level will be 18x50 feet in the clear.

SAN JUAN COUNTY.

The Sunnysine Extension mine is reported sold to Boston men, mostly stockholders of the Calumet & Hecla C. M. Co. of Michigan. The same company owns the Smuggler-Union mine at Telluride. The price paid for the property is said to be $300,000.

SUMMIT COUNTY.

Prospecting with diamond drills has disclosed good values in the ground of the Gold Pan. M. Co., on the Blue river, above Breckenridge, where they will begin hydraulicking in the spring.

TELLER COUNTY.

Work has been resumed on the Little Corporal claim on Raven hill.

The Comanche tunnel, Battle mountain, is in 650 feet.

The Moon–Anchor Con. M. Co. will increase its capitalization from $600,000 to $1,500,000.

The Elkton Con. Co. deny the local statement that the company has granted an option in the sum of $7,500,000 or $3 per share to the Venture Corporation of London.

Manager McDonald at the Gold King has the new hoisting works finished. The main shaft of the Gold King is 800 feet deep. About fifty tons per day of good smelting grade are produced.

The Gold Exploration tunnel is into the Mary McKinney vein and going under Anaconda gulch 12 feet per day. A new equipment has been put on, including a tramming engine operated by compressed air.

The Gillett Reduction Works, at Gillett, north of Cripple Creek, has shut down. This plant was the first in the district to treat ore by the chlorination process; newer and larger mills have been built in other places.

The Record hears of a projected consolidation of properties in the vicinity of and adjacent to the Isabella, the idea being to organize a corporation having a capitalization of $5,000,000, probally known as the Isabella Con. Mines Co., to absorb the properties of the Acacia, Arrow, Hart, Isabella, Orphan and probably the Pinnacle, the holdings of the company not to be purchased outright, but the holders of stock in them to have issued to them new scrip in exchange for the shares they held at the time the consolidation went into effect. The present market value of the mines is $3,359,900.

The fine mining plant on the property of the Gold Coin M. & M. Co. at Victor is in operation. The double hoist, capable of lifting from 3000 feet, and all accessory parts, give satisfaction. The compressor plant of thirty drills is also in operation. The management expect that this plant will be raised to sixty drills. The present compressor is run with steam; the second set of drills will be run by electricity. The entire plant all over this mine is convertible from steam to electricity with but small changes in the machinery.

IDAHO.

ADA COUNTY.

The Boise Statesman says the business of the first week of October at the United States assay office was the heaviest of the year, footing up to $90,914.41. The next heaviest week this year was the first in July, when the office handled $72,373.29.

BLAINE COUNTY.

Near Hailey work on the Gold Star mill is being pushed.

LATAH COUNTY.

Supt. Price says of the Hoodoo Hydraulic G. M. Co.'s operations on the Palouse river, 8 miles from its head, that the company has had two giants working from March 10th, night and day, till October 7th, with but five intermissions. The pay gravel is covered by 25 feet of clay. They are now cleaning up to bedrock. The pay gravel is from 1 foot to 9 feet deep. The gold is .941 fine, equal to $19.28 per ounce. The gold is coarse and mixed with quartz.

OWYHEE COUNTY.

A. J. Wiley, engineer in charge, tells the Statesman that by January, 1901, the Trade Dollar mines will be operated by electricity. The plans contemplate the generation of 3000 H. P.

Near Silver City the Trade Dollar mine is being inspected; J. Hutchinson is manager.

SHOSHONE COUNTY.

In 1899 were made in the county 781 quartz and 121 placer locations. In 1900, so far, 1042 quartz and 68 placer locations.

MONTANA.

CASCADE COUNTY.

At Swift Current a 200-foot tunnel has been contracted for on the Tiger property, a 600-foot tunnel on the Josephine, and 300 feet on the Mountain Chief.

The concentrators of the Esler Co. are completed.

FLATHEAD COUNTY.

Inter-Mountain: A. Hill has completed his report on the Snowshoe mine. When received it will be for the present owners to determine whether or not they will put more money in the enterprise, in order to make it a dividend payer, or to put the mine on the market, sell it for what it will bring, and let the purchaser do that part. Conservative mining men do not believe that the Snowshoe, as it is, can ever be profitably worked under the conditions that now exist. If the mine is to be worked, the first thing to be done is to explore the ledge by sinking, and determine the extent of the ore body. To do this, and do it right, will probably require the expenditure of not less than $50,000. If this is done and the showing is of a favorable character, then it will require more money before the mine can ever become a dividend payer. To be worked successfully, and to secure water to run the concentrator the year around, as has been stated before, it will be necessary to operate the mine from the Cherry creek side. Then, of course, new works will have to be built, and if the product is to be handled so that there may be no glut, it will be necessary to build a railroad from Libby to the mine. To do all this will require an expenditure in the neighborhood of $500,000. Will the present owners put up this amount of money? This is a plain statement of the facts and the conditions that affect the Snowshoe mine.

MISSOULA COUNTY.

Missoula reports closing down of the Copper Cliff mine.

NEVADA.

HUMBOLDT COUNTY.

The Nevada Copper Co. is erecting a smelter at its mines in Cottonwood canyon.

LINCOLN COUNTY.

The New Era M. Co. has incorporated; capital stock, $500,000; H. M. Brown, H. A., L. S. and A. G. Perkins, Searchlight.

LYON COUNTY.

The main ledge is cut in the Hulley-Logan mine, Como, in extending the lower tunnel, which connects with the milling plant. The tunnel is 1100 feet long. The property has a 10-stamp mill and a cyanide plant of fifty tons daily capacity. There are seventeen men employed in the mine and mill.

STOREY COUNTY.

The machinery taken out of the Union Con. mine will be placed in the Parrott mine at Butte, Mont.

President Leonard of the Comstock Tunnel Co. wants $20 per day for permitting the power company's wires to run through the tunnel. This is in addition to the amount now paid by the mining companies contributing to the cost of driving the Zadig drift, from which the Comstock Tunnel Co. now receives a daily income of $16.

The test of the Gould & Curry mill machinery is pronounced satisfactory.

WHITE PINE COUNTY.

An 80 H. P. boiler and other machinery for the Robust mill has arrived from Toano.

NEW MEXICO.

SANTA FE COUNTY.

The Santa Fe G. & C. M. Co. expects its new smelter will go into operation next month; capacity 200 tons per day. Nearest railway station, Cerillos, 14 miles away.

SIERRA COUNTY.

The Keystone mine, in the Black Range, shows 5 feet of ore in the south drift in the 135-foot level. The ore will stand wagon transportation of 85 miles and still leave a margin of profit.

SOCORRO COUNTY.

Supt. J. M. Allen of the Grand Ledge M. & M. Co. is putting a carload of machinery on the Cavern mine.

OREGON.

BAKER COUNTY.

The Golden Gate group of properties, near Geiser, is being developed by California men, under the direction of H. S. Sherard; Supt. H. T. Hendryx.

The Eastern Oregon M. Co., owning and operating the North Pole mine at Bourne, proposes to put in a tramway from the mine to the mill, which will be 7700 feet long.

E. J. Hahn, Supt. Inter Mountain, tells the Sumpter Miner he will work the mine all winter.

SOUTH DAKOTA.

PENNINGTON COUNTY.

The Mining Review says the Big Bend M. Co., below Pactola, on Rapid river, "is taking out about $1000 worth of gold per day. Steam elevators, dredgers, shovels and pumps are used and 1000 tons of gravel handled daily. Forty miners are employed."

The cyanide mill at Rapid City is in operation.

UTAH.

JUAB COUNTY.

At Eureka the Ridge & Valley M. Co. has filed suit against the Gemini M. Co. for $100,000 damages on the ground that the workings of the Gemini have been extended into Ridge & Valley territory and ore unlawfully extracted. An underground survey is asked for.

WASHINGTON.

FERRY COUNTY.

The Republic mill is running satisfactorily.

WYOMING.

CARBON COUNTY.

The option for $2,000,000 on the Ferris-Haggerty mine has expired, and the company refuses to grant a further extension of the option as asked for.

FOREIGN.

BRITISH COLUMBIA.

Near Ainsworth the Highland-Kootenay M. Co. is putting in a 200-ton concentrator. The Stevenson tunnel is in 1160 feet. The King Solomon M. Co. has seventy-five men at work on Woodbury creek and is putting in four power drills; D. Wingate manager.

At Phœnix the Knob Hill is working 200 men and shipping 300 tons of ore per day.

Three miles from Nelson the Venus G. M. Co., on Morning mountain, has had its ore analyzed as follows: Silica 68.18, iron and alumina 30.801, uranium 0.31, lime a trace, magnesia a trace, sulphur 0.53, total 99.821%. This is thought to be the first discovery of uranium in the province.

Commercial Paragraphs.

THE Risdon Iron Works, San Francisco, Cal., are building a steel oil tank with 1,500,000 gallons capacity, in the Kern river, Cal., oil field.

THE Westinghouse Air Brake Co. have ordered from the Burt Mfg. Co. of Akron, Ohio, a large Cross oil filter to equip their power house.

PERCY R. STUART, business manager of the California Wire Works of San Francisco, reports that he has sent out a number of millwrights into the country recently to erect tramways, and that several tramways now being put in shipping order are to be installed in the near future. It might be of interest to millwrights familiar with this class of work to correspond with the above-mentioned firm, with a view of taking charge of such outside work.

THE Rand Drill Co. has removed its main office from 100 Broadway, New York, to the fifteenth floor of the new building just erected by the American Exchange National Bank at 128 Broadway, corner Cedar St., New York City, to which place all future correspondence should be addressed. In its new office the company will occupy the entire floor, in conjunction with its allied interests: the Pneumatic Engineering Co., the Rendrock Powder Co. and the Davis Calyx Drill Co.

THE Joshua Hendy Machine Works of San Francisco, through their representative, J. K. Firth, have a contract to furnish mills, tramway and other apparatus for the Bald Mountain and Mammoth mines, near Sumpter, Oregon. The contract calls for, in the case of the Bald Mountain mine, a rock breaker of the gyratory type, four Challenge ore feeders, four 5-stamp batteries, complete, fitted with twenty 850-pound stamps, extra allowance amalgam plates, extra heavy plating of silver, and twelve 6-foot belt concentrators, the plant to be so designed and arranged with water motors that the crusher, battery and concentrators can all be operated independently. The head of water for this purpose is about 700 feet. There will also be installed an electric light plant for the mill and all outbuildings. In connection with the enterprise will be an inclined gravity tramway system leading from the ore bins at the mine directly to the mill, with automatic self-dumping cars. On the Mammoth mine will be put a 5-foot Bryan mill and four 6-foot belt concentrators.

Recently Declared Mining Dividends.

	Payable.
Gwin Mine Development Co., Cal., 10 cents per share, $10,000	Oct. 16

Personal.

F. H. GREEN, president Mayflower, Cal., Co., is inspecting the mine.

R. H. CAMPBELL has returned from San Francisco to Ashcroft, B. C.

C. H. LINDLEY has returned from Amador county, Cal., to San Francisco.

J. B. WHEELER, president Plumbago M. Co., Sierra Co., Cal., is at the property.

J. E. BEVERIDGE has returned to Bingham, Utah, from Ecuador, South America.

E. MCCORMICK, Supt. Vulcan M. & S. Co., Siegelton, Nevada, has returned from a professional Eastern trip.

JAS. A. DOUGLAS, president American Institute Mining Engineers, will remain in Europe till next February.

A. P. & J. I. MINEAR are prospecting copper properties at Hall's Bay, Prince of Wales Island, southeastern Alaska.

D. GILLIS has returned to Butte, Montana, and accepted a position with C. W. Clark as superintendent of his mining interests.

R. L. DUNN, formerly of Placer county, Cal., is managing the Golden Fleece gold quartz mine at Johnson's Inlet, Ketchikan, Alaska.

MARK B. KERR of Grass Valley, Cal., is in San Francisco on business connected with the mining company for which he is resident engineer.

HANS C. BEHR, who left San Francisco for South Africa and the Rand, writes that he has got as far as Cape Town, but may have to stay there three months.

W. C. MENDENHALL, E. B. RICHARDSON AND A. L. QUINEAU of the U. S. Geological Survey are in San Francisco, en route to Washington, D. C., from reconnoissance in Alaska.

W. E. THORNE, Supt. Gold Bug M. Co., Georgetown, Cal., goes temporarily to take charge of his company's operations at Fuerte, Estado de Sinaloa, Mexico. He expects to return to Georgetown early in 1901.

C. J. MOORE, back from London to Leadville, tells the Chronicle of the methods by which large mining companies are floated on the London market. The stock is placed through large brokerage concerns, who are enabled by means of an extensive clientele to control large sums of money. The Independence deal, for instance, was brought about in this manner. Several large brokerage firms secured big blocks of the stock, and then notified their customers of the figure at which it could be purchased, asking how much of the stock was wanted. The customers of the brokerage firms are men of wealth who are seeking investments, and who place, as a rule, great reliance in the recommendations of their brokers. A man who receives a notification that such and such a stock is for sale, and that he can get in on the ground floor, usually will subscribe, as in case of a refusal he is dropped from the list, and he doesn't want to miss a good thing. There are about 2500 people holding stock in the Independence, for which they paid $2 5s.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

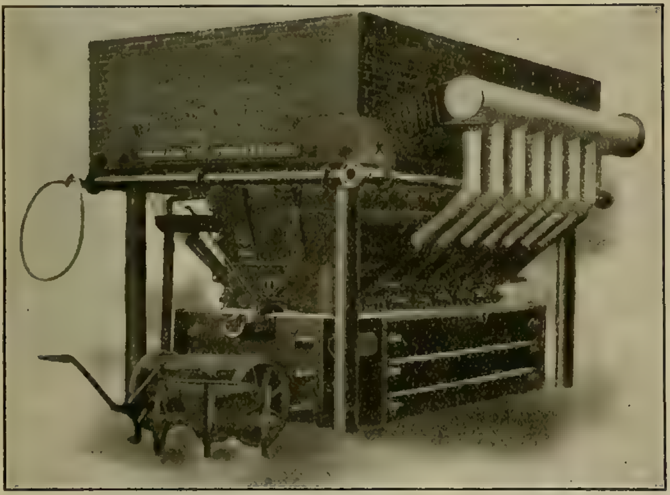
We publish sixteen catalogues. Write for one in the line you are interested in.

THE RISDON HAMMERED SHOES AND DIES.

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

RISDON IRON WORKS, San Francisco, Cal.

THE COLORADO IRON WORKS COMPANY,



ENGINEERS AND MANUFACTURERS OF

Smelting Furnaces and Equipments.

In this advertisement we show cut of a recent Silver-Lead Cast Iron Water Jacket Furnace. Some metallurgists prefer jackets made of steel plates, and under some conditions plate copper is demanded, although more expensive. Most of the important smelters are using cast-iron jackets now, hence we give prominence to that material. There are absolutely no conditions in blast furnace practice but are as well subserved by properly proportioned cast-iron jackets, as by those of any other material.

Write for our catalogue, showing many different styles of smelters for the treatment of

GOLD, SILVER, LEAD, COPPER AND NICKEL ORES,

also the latest and best method for the economical use of jacket water (a saving of 80% to 90% guaranteed) by our patented

WATER VAPORIZING ATTACHMENT.

We design, manufacture and erect Mills for Concentration and Amalgamation, Milling, Chlorination and Cyanide Processes. In writing for information, give us the analysis or character of the ore to be treated, to enable us to intelligently arrive at the proper method.

Our very complete catalogue of CRUSHING MACHINERY will be sent on application.

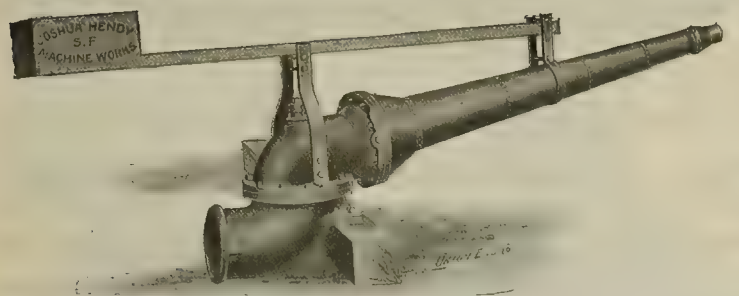
Double-Jointed Ball-Bearing Hydraulic Giants.



JOSHUA HENDY S.F MACHINE WORKS

The above presents an improved **Double-Jointed Ball-Bearing Hydraulic Giant** which we build. The improvement consists of the introduction of a **Ball Bearing** by which the pressure of the water is reduced to a minimum and the direction of the nozzle changed at will with ease.

Catalogues and prices of our specialties of HYDRAULIC MINING MACHINERY furnished upon application. **JOSHUA HENDY MACHINE WORKS, 38 to 44 Fremont St., San Francisco, Cal.**

TELL US WHERE YOU'RE AT.

4 Cents Per Ton Per Mile

**Is what it costs to transport Ore with our systems of Aerial Wire Rope Tramways.
We'd like to send you our book telling you all about it, but we can't do it unless you write us**

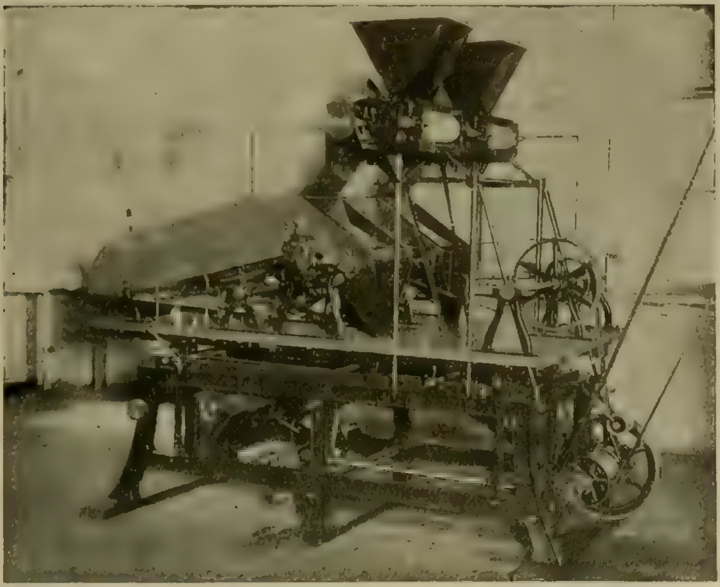
WHERE YOU'RE AT.

THE J. H. MONTGOMERY MACHINERY CO.,
DENVER, COLO., U. S. A.

CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



We have, now in operation, a complete plant for crushing, sizing and concentrating ores by the

Crown Dry Milling Process.

Mine owners desiring tests made can forward us, freight prepaid, not less than 1000 lbs. nor more than 4000 lbs. of sample, for which a charge of $20 will be made. (This amount includes assaying, etc.)

Ores for which this process is adapted and of which consignments are solicited are any concentratable ores, pulps, tailings, or sands, carrying sufficient values, whether they have heretofore been profitably concentrated or not.

SMOOTH-ON
TRADE MARK
CASTINGS.

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MESSRS. MADISON, BRUCE & SELLERS,

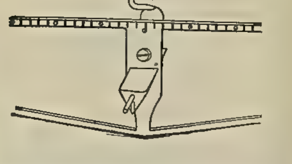
SIMMONS ENG. CO.

No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.

Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.



The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.

By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Correspondence solicited.
Samples given if required.

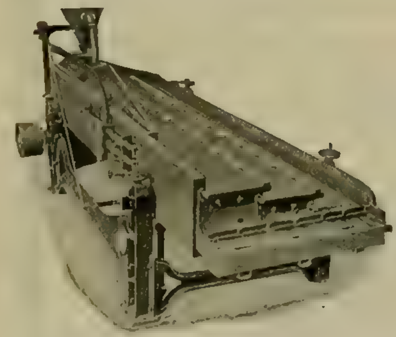
THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

SEND FOR FREE ILLUSTRATED AND DESCRIPTIVE CATALOGUE TO

Bradley Pulverizer Co., Boston, Mass.

THE IMPROVED BARTLETT CONCENTRATING TABLE.



The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMpany. — Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of September, 1900, an assessment (No. 24) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of October, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of November, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY. — Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of October, 1900, an assessment (No. 4) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, Room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of November, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of December, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Room 36, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY. —Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of October, 1900, an assessment (No. 120) of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 14 Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Tuesday, the 20th day of November, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of December, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14 Nevada block, No. 309 Montgomery street, San Francisco, California.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of October, 1900, an assessment (No. 16) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 29 Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of November, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of December, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29 Nevada block, No. 309 Montgomery street, San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY. —Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of October, 1900, an assessment (No. 10) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of November, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of December, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, California.

ALL ABOUT
Sight Feed Lubricators.

Our new catalogue for 1900 is ready for distribution. It explains in detail the principles governing the operation of Sight Feed Lubricators, using sectional view to show the internal construction, and containing cuts of the different styles in parts before being assembled into the complete lubricators, thus enabling every one to understand their construction and operation thoroughly.

In addition it shows our full line of Glass Oilers, Oil Pumps, Oiling Devices, Multiple Oilers, Valves, Etc. It will be sent to any address on application.

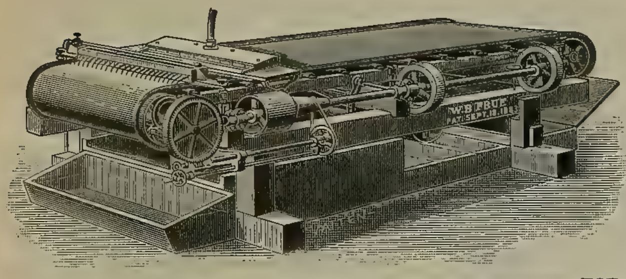
FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.



STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Buying Mining Stock.

From general newspaper discussion it is manifest that the fact is now well recognized that a stock company is a preferred way to get money for mine development, but there still seems to be considerable discussion in and out of the newspapers as to whether the stock so issued and sold shall be assessable or non-assessable.

In California there is no option, all mining stock being there subject to assessment, but in other States there is nothing in the law to prevent organization upon either an assessable or non-assessable stock basis. The latter plan is often adopted by those organizing a mining stock corporation, in the belief that such stock can be more easily disposed of; this belief being based upon a sort of sub-belief that those likely to buy the stock might shy at the assessable clause, fearing that they might be frozen out by unwise or unwarranted assessment.

As between assessable and non-assessable stock, the former is the better. Where one buys stock in an undeveloped mining property he presumably buys it for profit, one possibility of such profit being through having the property developed into a paying mine. This latter result is more often secured by assessable than by non-assessable stock companies. Although what might appear to be sufficient mining stock is set apart and sold for development purposes, it is, from the very nature of the case, usually sold so cheap that the money raised is not enough to develop the mine to a point where it will begin to pay dividends, so that when the money so raised is exhausted there is ordinarily no way to raise any more, the mine may be abandoned, all that has been invested lost and the stock useful only for wall-papering purposes.

Of course, this is not invariable, but it is not an overdrawn statement of a common result. Where the stock is assessable and it becomes necessary to raise enough funds to go ahead a small assessment permits of such progress. Where a stockholder feels it a hardship to pay out any more money, he has the option of selling a part of his stock to pay the assessment on the remainder, or can decline to pay any and quit, selling his stock for what he can get for it, in the latter event being no worse off than were he to have stock in a non-assessable company that would result the same way.

The great trouble with non-assessable stock corporations is that there is no way to assure continuance of work. It requires a constant unanimity of opinion and intent to go ahead, and whenever any of the stockholders become tired or discouraged or financially embarrassed, the load on the others, who are desirous of going ahead, is all the more onerous. Of course, all this opens up a very wide discussion; this whole matter of investing in mining stock has had so much said about it that it is probably unnecessary to be taken up here in detail. It is not here recommended that mining stock, assessable or non-assessable, be bought without careful consideration of all attendant circumstances; it is simply asserted that as between the two systems the assessable is the better.

Further Consolidation.

Consolidation being the order of the day, it is not surprising to learn of the contemplated amalgamation of the Gold & Silver Extraction Co. of America, Ltd., and the Cassel Gold Extracting Co., Ltd., to be known as the Allied Cyanide Companies of America, Ltd., with a capital of £110,000, divided into 110,000 shares, £1 each, 35,000 of which are to be preferred shares. The directors are to be Wm. Forrest of the MacArthur–Forrest Process, J. R. De Lamar of Colorado, Utah and California and Henry A. Jones, managing director of the Cassel Extracting Co., Ltd., of Glasgow, Scotland.

The proposition is to buy and work under British management with a local advisory board in Denver, the MacArthur–Forrest cyanide patent business of the Gold & Silver Extraction Co. of America, Ltd., and the zinc dust precipitation patents of J. R. De Lamar, the Denver advisory board to consist of Hugh Butler, Wm. H. James, Phillip Argall and Geo. A. Anderson, the latter to be general manager. An option has been secured on the Kendal patents.

The directors are advised by patent counsel that the patent which expires soonest should, under a recent change in the U. S. patent law, endure for six years, which would put the MacArthur–Forrest patent over to 1908. It is intended that the businesses be taken over November 1, 1900. It is also understood that, inasmuch as the development of the contemplated consolidated company's business would naturally affect the consumption and sale of cyanide in the United States, it is contemplated that a combination with cyanide manufacturers would be of further mutual advantage. It is further contemplated that properties susceptible of profit by being worked by the cyanide process could be acquired. It is understood that since 1893 the gross income of the Gold & Silver Co. of America, Ltd., has been in the neighborhood of $300,000, of which about 90% was from royalties.

An Unearned Award.

An editorial paragraph in the issue of the 6th inst., regarding the Paris Exposition, said that the wholesale granting of gold medals and honors brought the whole matter of awards into contempt. A manufacturer who himself rightly received the deserved award of a gold medal writes, questioning the fairness or accuracy of the statement. The assertion referred to was made advisedly and direct proof is available. An instance is to hand in California where notice was received by one gentleman from the Exposition authorities in Paris that a gold medal had been awarded to him for an exhibit made by him in Paris. The gentleman was naturally surprised, inasmuch as he had made no exhibition of anything, directly or indirectly, at the Paris Exposition. Upon inquiring about it from one member of the California Paris Commission, he learned that in the judgment of that member if he had not received a gold medal he deserved one anyhow, on general principles; that such award had been recommended by that commissioner, and that it was because of the latter's recommendation that the gold medal had been "awarded" to him. This is perhaps sufficiently indicative of the manner of award, and is doubtless equally indicative of the value of any prize capable of being so "awarded." If every one in California and the other forty-four States of the Union who might, could, would or should have secured a gold medal, had he or she exhibited anything at the Paris Fair worth exhibiting, but who did not exhibit anything, were awarded a gold medal, the demand for that precious metal might cause a rise in its price; but, from our standpoint, it is believed that, as in the case cited, the whole business has what seems a dishonest flavor. It is not only dishonest, per se, but is unfair and dishonest to the really deserving who won medals by merit and who are justly entitled to them. It makes ridiculous the whole affair, and it is because of this fact that the paragraph in the issue of the 6th was written, very mildly, but none the less truthful. It is fair to assume that since what we have cited above was done in the case of the California man, it could have been done, and was done, in sundry other cases. In all there were 34,852 medals "awarded." If each one of the 34,852 has to pay, say $12 or $15 apiece, to get his medal, the total ought to be quite a nice little sum for some one.

We would not detract from nor decry the value of any gold medal honestly earned by merit and exhibition, at Paris or anywhere else, but under the circumstances are inclined to the opinion that the announcement of such "award" is not universally entitled to the prominence in so many instances given by the local press.

Millions of dollars have been spent in mining machinery this year. (The readers of this paper have paid out $100,000,000 for mining machinery in the last ten years.) The makers and vendors of this machinery, which is the finest of its kind, do not consider mining to be the "gamble" that some people claim it to be. They consider the business of mining to be tangible, solid and legitimate as any other class of industry that calls for fine up-to-date machinery and pays for it. The sale of mining machinery at good cash prices kept many a manufacturing concern afloat through the latter nineties, and is the mainstay of many a large establishment now. For whatever other industries may do in the credit line, "jawbone" cuts no figure in securing mining machinery. If one wants it he must pay for it. That is one part of the business of mining, from which the "gamble" is thoroughly eliminated. To the clear-headed men who make the machinery the mining world is largely indebted for the progress that their ingenuity has made possible. Confident in being able to secure cash demand for their product, they have at vast expense built up large factories and produced devices that for applied power and efficient adaptability are not excelled in any department of manufacture.

Colorado's State Supreme Court has strengthened the rights of minority stockholders in a mining corporation by a decision this week that will deter subsequent attempts at "freezing out." The case was on appeal. The Ibex M. Co. had a majority of the stock of the Glengarry Co. and assumed control of the latter company in its interest. It arranged a lease and bond to itself of the Glengarry property in a way unsatisfactory to protesting minority stockholders in that corporation. There was no question of fraud raised, the point being, could the Ibex Co., controlling a majority share in the Glengarry, make disposition of the latter property contrary to the wishes of minority stockholders therein. The Colorado court holds that the Ibex Co. was virtually trustee of the interests of all the Glengarry stockholders, and, as such trustee, could not act in a manner contrary thereto, and that the Ibex Co. in acting as it did, tried to coerce the Glengarry stockholders into a disposition of their property at variance with true trusteeship, saying in effect that corporation property must be administered by its managers in a way that shall tend to the use and benefit of all its stockholders.

Notable in the history of mining was the introduction last Saturday of electric power on the Comstock, Nevada, not in any sense in the installation itself, for electricity in mining has been in use a dozen years, but as exemplifying what many consider a new era in the life of that famous lode, which has produced $400,000,000, and from which dividends aggregating $120,000,000 have been paid. The history of the enterprise has been so completely given in these columns from the time that this journal urged the move, to the present, that all necessary to now chronicle is that on the 20th inst. the electric current was turned on, starting the milling machinery. It is figured that power can be thus delivered at an exceedingly low rate. This, coupled with other economies and modern mining and milling methods, in connection with unwatering of the lower levels and deeper workings should insure new life to the great lode that made and unmade so many fortunes.

Concentrates.

A "BUSHEL OF CHARCOAL" in California has 2200 cubic inches.

STEAM is separable into oxygen and hydrogen between 2200 and 4500° F.

NEW ZEALAND has a tariff of 5% ad valorem on all kinds of mining machinery.

SHEETS of clear mica 4x4 inches are worth about $6 per pound in New York City.

AT the Homestake mine mill, South Dakota, 640 stamps are in present operation.

THE only magnetic substance in liquid form is liquid oxygen, at a temperature of about — 300° F.

BUT sixty-five days remain to do the necessary $100 of assessment work on unpatented mining claims for 1900.

CHLORIDE OF LIME (bleaching powder) was quoted in New York City on the 15th inst. at $10 per drum of 500 pounds.

A CUBIC INCH of aluminum weighs .0926 pound; of cast copper, .3179 pound; cast steel, .2823; cast zinc, .2482; cast iron, .2607.

REROLLED rails are in use on nearly every railway in the country. Rails originally 67 lbs. to the yard are rerolled to a 60-lb. section.

FOR purifying and regenerating air in mines or anywhere else, bioxide of sodium is recommended. It absorbs acid and liberates oxygen.

THERE is a U. S. import duty of 6 cents per pound on quicksilver, and that is just the difference between its price in New York and London.

THE present monthly copper output of the Anaconda is about 8,000,000, Boston & Montana 6,000,000, and Montana O. P. Co. 4,000,000 pounds.

CHLORINE, as used in the extraction of gold from iron pyrites, is prepared by the action of sulphuric acid upon sodium chloride and manganese dioxide.

COKE has been made from Utah coal which, when tested at Salt Lake City, was pronounced satisfactory in every respect, compact and free from sulphur.

THE Calumet & Hecla, at Houghton, Mich., saves about seventy pounds copper per ton in the mills; about six pounds per ton crushed goes in the tailings.

THERE is no chemical antidote in cases of poisoning by swallowing salts of lead or copper. A mixture of fresh milk and magnesium hydrate is recommended.

MUNTZ METAL is a brass composition of 3 parts copper to 2 of zinc. (Ordinary brass is 2 parts copper, 1 of zinc.) Muntz metal can be rolled or forged when hot.

ON the Rand, South Africa, at the cessation of active mining the average duty per stamp per day was 4½ tons. The average working expenses were about $6 per ton.

THE total cost of the Boer war to the British Government is £60,000,000, which will be charged to the resources of the Transvaal, particularly the gold mines of the Rand.

THE specific gravity of petroleum spirit for an automobile should be about 0.680 at a temperature of 60° F. A depression of 30° F. causes an additional 15° to the specific gravity.

THE highest price ever paid for gold by the Melbourne, Australia, mint was last September to the Cassilis G. M. Co., Cassilis, Victoria—£4 4s 7½d per ounce, equivalent to $20.581.

A 20-INCH cast iron water main subject to a pressure of 150 pounds per square inch should have a thickness of .9757 inch; a 40-inch pipe in the same conditions should be 1.6313 inches thick.

AN explosion is a rapid chemical change taking place with the liberation of a great amount of heat. Almost any explosive becomes comparatively harmless if mixed with some neutral solvent.

A "KNOT" is 6086 feet. The indicated rate of 18.54 knots per hour made by the battleship Wisconsin, in Santa Barbara, Cal., channel on the 11th inst., was at the rate of 112,834.44 feet, or 21.37 miles, per hour.

TO FIND the weight of castings by the weight of pine patterns, multiply the weight of the pattern by 12 for cast iron, 13 for brass, 19 for lead, 12.2 for tin, 14.4 for zinc; the product in each case will be the weight of the casting.

THE latest advance information as to who is going to put in new mining machinery, or is likely to be in the market for mining or metallurgical devices of any kind, is always to be found in the pages of "Mining Summary" in each issue.

THE weight by which diamonds and precious stones are calculated is: 4 grains = 1 carat; 157½ carats = 1 ounce troy. A fine diamond, perfectly white and pure, weighing 1 carat is worth $100; 2 carats, $400; 4 carats, $1100; 5 carats, $1750.

IN the hands of an expert a blowpipe is of great value in analysis, but for a prospector in the field its use or value is limited. The services of a competent assayer, even though at a distance and with attendant expense, would be usually more satisfactory.

A BOILER horse power represents the evaporation of thirty pounds of water per hour from feed water at 100° F. into dry steam under a pressure of seventy pounds by the gauge. So that a 35 H. P. boiler is one capable of evaporating 1050 pounds of water per hour from a temperature feed of 100° F. into steam at seventy pounds gauge pressure.

CAST IRON after solidifying in the moulds contracts while cooling about ⅛ inch per foot of length. To allow for this contraction pattern makers use a special rule, called a shrink rule, for measuring patterns. It is ⅛ inch per foot longer than the standard rule.

OCEAN CABLEGRAMS are not received as ordinary telegraphic dispatches. They are written on a strip of paper in motion by a siphon recorder, a stream of ink which flows from the fine tip of a glass tube moved to and fro by a coil of wire in accordance with signals.

FOREIGN mining companies operating in Russia must employ a Russian mining engineer to direct the work, with full power to employ and discharge all subordinates. The general tendency of all Russian regulations and requirements is to discourage foreign mining investments.

IF a silver property will yield an average of fifty ounces per ton, that at going rates is $32, and at the ordinary mining and reduction charges that ought to pay well; pay better in these days of economic appliances and improved processes than in the old days when it was $1 per ounce.

WHEN an invention becomes abandoned to the public it is no longer patentable. Abandonment, however, may not be presumed. It is only where the fact is made clear, either by the testimony of witnesses or the action of the party himself, that can be set up to defeat the inventor's claim to a patent.

A MOVEMENT originated some time ago in the Dawson Board of Trade to reduce commercial gold dust from $16 to $15 per ounce; but one of the leading companies withdrew from the agreement, and dust still continues to be received at $16 in payment of all bills in Dawson, except when otherwise specified.

MAGNESITE is largely used in making medical salts, carbonic acid gas, and as a filling for wallpaper. Much of the magnesite used in this country is mined in Greece at a cost of about $3.50 per ton and brought to the Atlantic ports for about $1.50 per ton more, selling in Philadelphia and New York for about $7 per ton.

MALLEABLE CASTINGS are made by putting a gray iron casting in a suitable box and covering it with powdered red hematite, which is an oxide of iron, and keeping it in a furnace at a bright red heat for from three to thirty-six hours, dependent upon the size of the casting. Malleable castings can be worked like wrought iron, but will not weld.

TO DRILL a hole in case-hardened iron or steel, heat the steel or iron to a red heat, and while it is in the fire drop a lump of sulphur on it just where the hole is to be drilled. Take it out of the fire and let it cool off itself. After the hole is drilled put it back into the fire, heat to a red heat, sprinkle sal-ammoniac over it and plunge in water to harden.

"THE California Dustless Roads Co. of Los Angeles" contracts to sprinkle with oil and keep in repair roads in southern California. They have oiled 32 miles of roads in Kern county, Cal.; cost per mile, $250. There is about 40% asphaltum in the oil. The effect on the roads is somewhat similar to that when paved with asphalt, becoming smooth and bearing heavy travel.

BABBITT METAL is a soft, white metal used largely for lining shaft bearings. Its usual composition is: Copper 4 parts, antimony 8, tin 24, melted together, and, before using, the alloy is melted with an addition of twice its weight of tin and applied to the bearings while molten. So that the real composition of the lining is copper 4, antimony 8, tin 96.

"HARVEYIZED" steel plate for battleship armor is made by the introduction of carbon by cementation into the face of an ordinary low-carbon steel plate, subsequently it is water-hardened similar to an ordinary tool. After this treatment it presents a hard-faced surface, to the depth of about 1 inch, designed to stop and break up projectiles before serious penetration takes place.

"EVERYBODY is wiser than anybody," and whenever anyone, anywhere, in any mining or metallurgical work, knows of anything that he thinks would be of interest, this paper would be pleased to publish the particulars, and if accompanied by a photo or sketch, the latter to be suitably engraved to illustrate the matter. In no better or more practical way can mining and scientific progress be advanced, and it is the men who do things who are best qualified to write about what they have done, thus adding to the stock of general information.

IN its pure state lead is unacted upon by pure water. If air be present in the liquid or its surface be freely exposed to the atmosphere, lead oxidizes, the latter uniting with water and carbonic acid therein and becoming dissolved. Chloride of any kind in the water increases such action; sulphates or phosphates in the water check the tendency to act on the lead. In case of poisoning by acetate of lead, the stomach should be immediately emptied by an emetic of sulphate of zinc, and then large quantities of milk swallowed in which is considerable white of egg. A good chemical antidote for such lead poisoning is sulphuric acid in the form of a solution of magnesium and sodium sulphate. Either of these salts would decompose the lead compound, with the formation of insoluble and inert lead sulphate. Alkaline sulphide would give rise to the insoluble sulphide of lead. These salts, however, are in themselves poisonous, in large doses, and their use should be only with great care and under the guidance of a physician.

STEEL is made from wrought iron by adding a little carbon, or from cast iron by extracting some of its carbon. There are three ways of doing this—the Bessemer, Siemens-Martin and the cementation processes. Bessemer steel is made by pouring melted cast iron into a converter through which a blast of air is forced. In this way the carbon in the cast iron is burned out, leaving almost pure iron. To this is added a certain quantity of spiegeleisen, which is a compound of iron, carbon and manganese, and then the molten metal is cast into steel ingots. Siemens-Martin steel is made by melting wrought iron and cast iron, or cast iron and certain kinds of iron ore, together on the hearth of a reverberatory gas-furnace. The cementation process consists of imbedding bars of wrought iron in powdered charcoal in a fire-clay trough and placed in a furnace for several days at a high temperature. The iron combines with portions of the carbon and forms blister-steel—so called from the blisters found on its surface. Bars of blister-steel about 18 inches long are then bound together by strong steel wire and heated to a welding heat; then hammered and rolled into bars called shear-steel.

A DIRECT-ACTING steam pump is one in which there is no rotary motion, the piston being reversed by an impulse derived from itself at or near the end of each stroke. There is but one steam cylinder for one water cylinder, the valve motion of the steam cylinder being controlled by the action of the steam in that cylinder. The peculiarity of the duplex pump is that there are two steam cylinders and two water cylinders. The piston of one of these cylinders works the valve of the other cylinder, and vice versa; either can work alone. A direct-acting steam pump does not work steam expansively, from the fact that there would be danger of sticking upon the centers in most cases if there was lap and expansion, and to overcome this difficulty a small supplementary piston is actuated by the main piston in several different ways: First, the main piston strikes the tappet of the small valve, which opens an exhaust passage in one end of the cylinder containing the supplementary piston, and having live steam pressing upon both ends of the supplementary piston. Second, by the main piston striking a rod passing through the cylinder head and moving a lever which controls the motion part of the main valve, to which is attached the valves which move the supplementary piston. Third, the main piston rod carries a tappet arm which twists the stem of the supplementary piston, thus uncovering the posts, which causes its motion. Fourth, a projection upon the main piston rod engages the steam and operates the valve which moves the supplementary piston, and is controlled by steam. The kind of valves that are generally used on steam pumps are the hinge, poppet and ball. The hinge valve will let comparatively large bodies pass through it. The advantage of the poppet valve is capability of being adjusted as to lift, quickness of closing, and of being constructed of almost any kind of material. The ball valve can be worked very hard with little injury to itself or to its seat.

THE "Swinburne process" of treating zinc in complex sulphide ores consists of stirring the crude ore into a bath of molten zinc chloride contained in a cauldron heated from beneath. A small quantity of molten lead in the bottom of the cauldron alloys with and entirely removes the silver and gold from the ore, dissolving a small portion of the lead as chloride in its place. The rich lead is then withdrawn and the mixture of sulphides and chlorides of lead and zinc is subjected to the action of an electric current. The lead is first deposited as molten metal, and collects in the bottom of the cauldron. No chloride is given off from the fused mass, but sulphur, in the form of vapor, escapes. The action of the current is continued until all the lead chloride is decomposed and the zinc chloride begins to be acted upon. By interrupting the process at this stage the lead may be withdrawn. If electrolysis is continued further the zinc is then deposited, also in a molten state, and collected in a similar manner. The gangue and decomposed matter, remaining after all the zinc sulphide has been decomposed by the electric current, is raked out, and this residue is heated in a retort, which drives off the whole of the zinc chloride remaining, leaving nothing behind but worthless residue. The zinc chloride so distilled is allowed to run in a molten state back into the electrolyzing cell. For convenience of working, the process is preferably divided into three operations. It is much cheaper to deposit lead electrolytically than it is to deposit zinc electrolytically; therefore, should the composition of any class of ore render it desirable, it will be possible to stop the process short of the recovery of the zinc. The cost of operating the process in Australia, it is said, did not exceed $9.50 per ton of ore for complete recovery of the lead and zinc, or $6.25 per ton, omitting the recovery of zinc. This process differs from others, inasmuch as it extracts the precious metals first, and then the lead, and finally the zinc. It directly splits sulphides into sulphur and metal without any intermediate oxidation of the ore. The electrolytic process applied to the recovery of lead is a comparatively simple matter, the same electrical energy required to deposit one ton of zinc being capable of depositing upwards of three tons of lead. Moreover, in electrolyzing fused chlorides very high current densities are possible, so that the apparatus employed becomes small in comparison with that which is required for depositing metals in the wet way.

The Oil Fields of Kern County, Cal.*

Written for the MINING AND SCIENTIFIC PRESS by H. G. PARSONS.

KERN RIVER DISTRICT.—After visiting the Kern River oil district and obtaining ocular and olfactory proof of the deposit of petroleum which underlies this region, one marvels that these vast oil-bearing strata should have furnished so little surface evidence of their existence. At several points in the south San Joaquin valley are visible within one acre more signs of oil deposits than could be found in the entire 20 square miles embraced in the present area of the demonstrated field along Kern river. At McKittrick, Sunset and other places crude oil oozes from the hillsides, while asphaltum deposits and mineral springs betoken the proximity of petroleum. At Kern river, however, the surface indications, aside from general geologic formations common to oil districts, seem to have been confined to a small patch of oil-saturated sandstone on the north bank of the river—where the discovery of oil was afterwards made—and to a gas well on the Barker ranch, 5 miles east of the surface croppings. These are the only specific indications of oil in this locality that are alluded to in a publication of the State Mining Bureau devoted to this subject issued in 1894. Five years after this the persistence of a small coterie of unscientific laborers exposed the existence of a petroleum formation, which, by its uniqueness and extent, is attracting present attention. From the point of discovery, on Section 3, Township 29 S, Range 28 E., M. D. B. & M., the demonstrated field has lengthened and broadened, until now twenty or more sections of land are embraced in what is locally called the "sure" territory, and every few days a new well in one direction or another proves the extended scope of this deposit. Seemingly, the oil-bearing formations do not lie in the apexes of main or lateral anticlines, which are to be traced with scientific exactness by geologic structure.

The richest stratum of oil-bearing sand—in which most of the wells now stop—is struck at a depth varying from 700 to 800 feet. This depth depends upon the altitude of the surface location. At present so clearly defined is this rich stratum that an experienced driller can from his logbook foretell within 6 or 8 feet the point at which he will strike oil. Some of the earlier wells were stopped at a depth of 500 or 600 feet in oil-bearing sand of less richness and thickness than the stratum now selected. The lower stratum is over 100 feet in thickness, separated from a stratum above by a thin streak of clay. Undoubtedly, many of the first wells will after their productiveness diminishes be sunk into lower strata and thus be given new life. There seems to be a slight northwesterly dip to the formation, corresponding to the trend of the belt, so that the wells in the northwestern end of the field are sunk deeper than those to the southeast. Within an area of 6 miles in length by 3 miles in width there has yet to be recorded a failure in striking oil, if the well has been pushed down to a maximum depth of 1000 feet. Beyond the area mentioned several wells have been sunk below the depth named without getting into oil sand, demonstrating that the field terminates or that the sand lies very deep.

There are now in the Kern River district at least 200 producing wells, with fully 200 wells in process of drilling. As a well is completed within six weeks or two months, it will be seen that the number will increase at a rapid rate, even with the 200 rigs now in the field. In addition to this, new rigs are constantly being constructed. The output, as estimated from railroad shipments and the consumption in the field, is 5000 barrels per day. It is expected that this output will be increased as soon as greater tankage facilities are provided, or as soon as projected railroad spurs have been completed. At present there are many wells which are capped, waiting these desiderata. All of this development of oil resources has taken place within the last fifteen months. Considerable has been said about the Standard Oil Co. entering the Kern river field for the purpose of constructing tanks and ultimately handling the product of the district. The producers are not waiting for the Standard Co. They have formed an association looking to the more systematic disposal of their output, and they will co-operate on this line. In the meantime three steel tanks, of capacities ranging from 20,000 to 36,000 barrels, are completed, and one company—the Aztec—has finished a cement cistern of 30,000 barrels capacity, from which a pipe line will run to the spur railroad track. The cement cistern will obviate much of the evaporation which inheres to the open-tank method of storing oil.

The possible wealth of the Kern River district may be judged from the following sentence from another article written by Prof. Cooper, where he says: "A cubic foot of sand will hold 1½ gallons of petroleum oil. A volume of sand equal in area to one acre, and 100 feet in thickness, will hold in round numbers 6,600,000 gallons of oil, or 167,000 barrels." The depth of sand in the Kern River district is from 200 to 400 feet. In the demonstrated field $5000 per acre is a common price, and contracts have been signed with that figure as a basis, with option to purchase extending one year.

The petroleum drawn from the shallower wells, mainly in the southern part of the field, is heavier than that taken from the wells in the northern end. The specific gravity of the former is 13° (Baume), of the latter about 15°. In the case of the heavier oil, steam is often injected into the casing at a point where the oil is drawn, the heated steam increasing the fluidity of the oil and making it easier to pump. Steam is also injected into the bottom of the oil tanks, making the thick fluid more ready to flow through the outlet pipes.

Although considerable gas is present in the Kern River oil, no systematic method of saving it has been devised, as in the Coalinga field, where it is collected at the various wells, conducted to a retort, and there drawn off as fuel for different boilers. Occasionally the inflammable gas causes disaster, as in the case of the Sterling Company (as reported in the MINING AND SCIENTIFIC PRESS of the issue of the 6th inst.), where an open forge in the derrick enclosure set fire to escaping gas, the derrick being immediately consumed. The presence of gas is evidenced by bubbles which force themselves through the thick fluid, in a few instances carrying oil over the top of the casing, and thus creating flowing wells. Freshly drawn oil is filled with minute gas bubbles; as these escape the fluid settles to a heavy, dark, viscid mass, somewhat resembling thin tar. Thus the real production of a well is sometimes overestimated, by reason of the gaseous character of the product.

Oil wells in the Kern River district are sunk either by contract with well drillers, or competent help is employed by the companies at day's pay. Where contracts are made, the price varies from $1.50 to $3 per foot. In a majority of instances the day's pay method is adopted, because the companies' operations are usually managed by superintendents, each of whom may assume general charge over a dozen gangs of drillers. Where a company desires to be economical, and wishes to sink first an experimental well, the contract plan possesses advantages. It obviates the direct employment of high-grade help and lessens the preliminary investment, as contractors possess complete drilling outfits of their own. In fields distant from railroad facilities, contractors' prices run as high as $5 or more per foot, in addition to which the company must, of course, supply the casing and accessories. In such districts the well may cost $10 per foot. There is brisk competition among contracting drillers at Bakersfield, and where several bids are solicited a company may get its work done at reasonable rates. A conservative estimate of the expense of sinking a well 1000 feet in the Kern River district is as follows:

Cost of rig for first well	$2,200
Labor	1,200
Casing (1000 feet)	1.800
Incidentals covering accidents, etc.	1,000
Total	$6,200

Deducting $2200, the cost of the rig—which is in the nature of a permanent investment, available in drilling other wells—and the net cost of a 1000-foot well is $4000. The formations in this district are exceptionally favorable, as no boulders or inclined strata of hard rock (those banes to the driller) are encountered. This is shown by the log book of one of the companies in the central part of the demonstrated field: First 15 feet in soil; 15 to 50 feet, gravel; 50 to 90 feet, yellow clay; 90 to 220 feet, blue clay; 220 to 300 feet, dry sand; 300 to 360 feet, sand, some oil; 360 to 372 feet, white sand; 372 to 384 feet, blue clay; 384 to 409 feet, oil sand; 409 to 443 feet, white sand; 443 to 482 feet, oil sand; 482 to 505 feet, blue clay; 505 to 535 feet, oil sand; 535 to 540 feet, blue clay; 540 to 585 feet, oil sand; 585 to 606 feet, blue clay; 606 to 658 feet, oil sand; 658 to 664 feet, blue clay; 664 to 741 feet, oil sand; 741 to 755 feet, slate; 755 to 760 feet, oil sand, stopping in blue clay. This well was started 125 feet above discovery well on bank of Kern river.

The wages of workmen in the Kern county oil fields are about as follows:

	Per Day, with Board.
Boss drillers	$5 00 to $6 00
Tool dressers (helpers to boss).	3 00
Boss rig builders	3 00 to 4 00
Ordinary carpenters	2 50 to 3 00
Roustabouts	2 00

The above, as indicated, includes board and conveniencies for lodging in bunk houses, the workmen furnishing their own blankets.

One of the most frequent causes of stoppage in a productive well is the "sanding" of the pump. The pump tubing is 2 inches in diameter, inserted in the center of the casing, which is capped. The sand which floats with the oil through perforations in the casing acccumulates in such quantity in the tubing that the pump valve becomes clogged. It is then necessary to draw out the entire string of tubing, and to bale the casing free of accumulated sand. Then the cleaned pump, with its tubing, is lowered into position and operations resumed. There have been instances in which heaving sand, or that which accumulates above the pump by the working thereof, holds a pump so firmly in the casing that the pump cannot be moved. Then the pump must be hydraulicked loose, or the entire string of casing has to be drawn. This trouble involves great expense and sometimes results in a ruined well.

Oil lands are now largely worked on long-term leases, with option to purchase at a fixed price within a year or two. Besides a cash bonus which is often exacted for a lease, a royalty must be paid by the lessee, varying from 10% to 50% of the gross output from the land. This royalty is governed by the "sure" or the uncertain character of the territory leased. In Kern River district the maximum royalty is 50%; a customary royalty is 33⅓% or 37½%, while the option purchase price is $1000 to $5000 per acre. There are usually conditions in leases to the effect that drilling shall actually begin within thirty or ninety days; that a certain number of feet shall be drilled each year, or a certain number of wells be completed within a specified time, and usually one to each acre. With the present feeling of confidence in oil operations, the lessors dictate the terms. If not suited, the contemplating lessee can take to "wildcatting," as ventures are entitled which are located outside of demonstrated oil fields. In outside districts leases are effected at royalties ranging from 10% to 25%.

The development of Kern county's oil fields has given great impetus to the business affairs of Bakersfield, the practical center of all the districts in this county. It is estimated that there are employed in this industry in the Kern River district alone 1000 to 1200 workmen. Besides this, employment is given indirectly to many teamsters, freight handlers and other classes of labor. Surely, Bakersfield has reason to bless the day when old Jud Ellwood and Tom Means uncovered the hidden wealth lying beneath the barren hills of eastern Kern. She might appropriately perpetuate their memory by erecting in her Chamber of Commerce, or in her contemplated Oil Exchange, statues of these worthies cut from solid asphaltum, with their feet anchored in the oleaginous sands which have shaped the destiny of the city.

With reference to individual or company effort in the Kern River district, many interesting and commendable records have been made. I particularize in the following instances:

J. J. Mack and John M. Keith of the Bank of Bakersfield, with their associates, were among the pioneers in the field. They showed their faith in the stability of the oil industry by the investment of capital when such investment meant a great deal in the direction of development. They formed the Imperial Oil Co., secured an entire section of land, and began work in August, 1899, at a point where their subcompany, "Thirty-three," have since registered such a success. The latter company now have seventeen completed wells, with four more drilling. They are laying an 8-inch pipe line 5600 feet to the railroad track. They estimate that their output will amount to 1200 barrels per day. Besides owning Sec. 33, 28–28, the Imperial Oil Co. own all of Sec. 1, 29–28. They have eight completed wells on territory not controlled by "Thirty-three." Mr. Mack and associates are interested in other lands and properties. On account of this, and by reason of their commercial position, they are considered important factors in Kern county's present advancement.

Chanslor & Canfield were among the early operators in Kern River district. Their success at Coalinga gave them prestige, and, when they evinced their faith in the newer districts by investments, they added impetus to the oil "boom." These gentlemen, with their associates, notably Mr. Doheny, who met with such success as a pioneer on Sec. 3, 29–28, Kern river, organize companies and prosecute work for the purpose of securing productive wells. They are not sellers of stock, but are in the field as buyers or lessees of land and shippers of oil. They are connected with the Comet Oil Co., on Sec. 28, 28–28; the Canfield, the Chanslor and the Doheny oil companies, on Sec. 29, 28–28, and other enterprises in various parts of the field.

The San Joaquin Oil & Development Co. began operations one year ago. They own nearly 500 acres of patented land in the Kern River district and lease ten acres in the heart of the defined belt. On Sec. 5, 29–28, they are pumping from six wells, having here a complete pumping jack. There are two good water wells on this section. On the Means tract, Sec. 3, they have four wells completed and ready to pump, but no pumping jack. The company keep four new strings of tools at work all the time, and by Jan. 1st, 1901, expect to have completed six new wells. The product of the company at present is stated to be about 750 barrels per day. They shipped during the first half of October sixty-four carloads of oil, are now completing a 6-inch pipe line, 1 mile long, to the railroad track; have tankage capacity of 42,700 barrels. They have eighteen of the small forest of derricks which dot the field in their locality.

(A good idea of how this whole section of country looks is afforded by the views on the front page, for which I am indebted to the courtesy of the Bakersfield Californian.)

The Central Point Consolidated Oil Co., on the east side of Sec. 4, 29–28, has eighty acres leased from the Bakersfield & Fresno Oil Co. on one-eighth royalty. Work was begun on the property last March. In May 1100 barrels of oil were delivered at the Santa Fe station in Bakersfield by wagon; in June, 3800 barrels; July, 4600 barrels; August, 9200 barrels; September, 15,300 barrels. The oil during the latter month was delivered direct from pipe line into the cars on branch line running up Kern river. During September this 15,300 barrels were pumped from six wells. They expect that October will show an output of 20,000 barrels, and think by the first of November they will have eleven wells in operation, producing about 30,000 barrels per month. The company is capitalized at $200,000; par value of shares, $1 each; B. F. Brooks, president; L. Peyton, secretary; principal place of business, Bakersfield.

---

*See engravings, front page.

The Senator Oil Co. furnishes another good showing. They paid $650 per acre for eighty acres in Sec. 31, and have executed a lease to Fresno men for 37½% royalty, lessees having an opportunity to buy within eighteen months at $5000 per acre. The three wells that the company have completed are reported to be pumping 125 barrels oil per day each; No. 4 is down 735 feet, showing a body of oil sand; wells Nos. 5 and 6 are down 400 feet and 200 feet, respectively. The Bear Flag Oil Co. have leased their west 40, are putting up derricks and houses and expect to be drilling on their first well Nov. 1. As in the case of the Central Point Con. Oil Co., B. F. Brooks is president and L. Peyton secretary of the Senator Oil Co. at Bakersfield.

The Aztec Oil Co. is another evidence of what the Kern River oil district will show under careful management and energy. This company bought eighty acres of the Kern Oil Co. May 25th and now has eight completed wells, and are drilling on No. 9. They have a storage capacity of 17,000 barrels; pipe lines laid to the railroad and facilities for loading nine cars per day. The company is capitalized at 250,000 shares, of the par value of $1 each. The company paid $1350 per acre for the land. The wells, drilled to 800 and 900 feet, are producing 125 barrels of oil per day and show a depth of 500 feet of oil sand. Their principal place of business is at Bakersfield; B. F. Brooks and L. Peyton are president and secretary, respectively, of the Aztec Oil Co., also.

The Petroleum Center Oil Co. own all of Sec. 8, 28–28, twenty acres in Sec. 28, 28–28, forty acres in Sec. 24, 28–27 and eighty acres in Sec. 13, 28–29. They have four producing wells on Sec. 28, with a complete pumping plant; on Sec. 8 they have one well in process of drilling; on Sec. 24 they are drilling a second well, the first having been injured by an accident, and it was then converted into a water well. They operate two complete drilling rigs. The Petroleum Center was the first company to strike oil in Township 28–27. Operations were begun in December, 1899, and oil was struck the following February. They are now 200 feet in oil sand. Dr. Wm. Johnson has assumed management of operations in the field, E. F. Beck (formerly in charge) having gone East.

The Shasta Oil Co. are operating an extensive plant in Sec. 14, 28–28, developing a considerable amount of gas, are working in oil sand and expect to get a gusher. Much development work is going on in Township 28–27 and to the westward. Wm. P. Todd is looking after the interests of the Shasta Oil Co. in Bakersfield.

The Century Oil Co., on Sec. 24, 28–27, are nearing oil sand in their third well. Their neighbor—the Santa Barbara Co.—dropped into oil at 850 feet.

The Petroleum Development Co. have their main interests in the oldest part of the field, where they did so much in the fall of 1899 to prove the abiding character of the new industry. Their first well is not 100 yards from the old discovery well of Jud Ellwood, on Sec. 3, 29–28. Around their enterprise and that of the Treadwell Co. at this point a settlement has sprung up amounting to a village, and dignified with the name of Oil City, though it is thought Ellwood is a better name. The company started their first well Sept. 14, 1899, on land leased of the Kern River Land Co. and struck oil in twenty days at a depth of 280 feet. They now go deeper, the average depth of the twenty or more producing wells of the company being 500 feet. The average production of each well is stated to be forty-five barrels per day. They shipped in September 18,000 barrels. They keep three drilling rigs at work. Nearly all of their wells are in the northeastern end of the field, close to the river bank.

The Treadwell, or S. P. Co., have a cluster of wells in the same neighborhood, both companies being convenient to the spur railroad track, which terminates near there.

The Reed Crude Oil Co. is a large producer and a vigorous prosecutor of development work. It is composed of Los Angeles business men, who have done so much by their energetic methods to advance the oil interests of Kern county. They knew something about the oil business before coming into the field, and their operations have been characterized by the spirit of push which merits success. They have nine producing wells on Sec. 34, 28–28; ten producing wells on Sec. 28, 28–28, five drilling, with derricks for five more; three producing wells on Sec. 32, 28–28, two drilling, one discovery, one water well and four derricks; two producing wells on Sec. 20, 28–28, and three drilling. They own forty acres on Sec. 2, 29–28, and 320 acres on Sec. 14, 29–28. Their estimated output is 800 barrels per day.

The Monte Cristo Oil Co., on Sec. 5, 29–28, have one of the few flowing wells in the district. This well is 1000 feet deep and daily yields nearly 150 barrels. The average of their four producing wells is seventy-five barrels per day each. They are drilling two new wells and have a rig for another. Ordinarily, this company has struck oil at a depth of 450 feet; their oil stratum is 280 feet thick.

The Globe Oil Co., having forty acres on Sec. 30, 28–28, are pumping from four producing wells, yielding an aggregate output of 400 barrels per day, and drilling a fifth well. T. H. Noxon, the superintendent, is a believer in deeper wells for the Kern River district, and will drive his fifth well beyond 1000 feet.

The Grace Oil Co., on N. E. ¼ Sec. 8, 29–28, have three producing wells; have just completed a boiler-house and are about ready to begin pumping.

The Kern River Oil Co., having eighty acres on Sec. 4, 29–28, are getting oil from four producing wells. This company owns very productive property in the McKittrick district. The Peerless Oil Co., on Sec. 31, 28–28, have five producing wells, two drilling, one being in oil sand at 550 feet. The Kern Oil Co., on Sec. 32, 28–28, have one producing well, one water well and three drilling; are planning to put up three more rigs and are laying 5⅝-inch pipe line to railroad. The Comet Oil Co., on Sec. 28, 28–28, have two producing wells, one of them yielding at 460 feet; 50 to 100 barrels per day from each well. The Independent Oil Co., on Sec. 28, 28–28, have two producing wells, the one last finished yielding thirty-five barrels per day, the other having settled down to a steady product of twenty-five barrels per day. This company own 160 acres in Sec. 2, 27–29. The Continental Oil Co. of Los Angeles, on Sec. 29, 28–28, have two producing wells of 200 barrels each per day; they intend to put down forty wells on forty acres. The Canfield Oil Co., on Sec. 29, 28–28, have five producing wells of 100 to 125 barrels per day, with two wells drilling; have rigs for two more wells. The Junction Oil Co., on Sec. 9, 29–28, have three producing wells and one now drilling. Spellacy et al, on Sec. 30, 28–28, have two producing wells, and are now at work on a third. Several wells have struck the oil sand in the northeastern part of the field, in F. 28, R. 27, but the oil belt is not yet clearly defined at this distance from the point of first discovery. Those who own property in the trend, as already defined, are very hopeful. Land thereabouts can not be bought for less than $150 to $300 per acre. I visited many producing wells not mentioned herein, but those described are types of those in the district.

Bakersfield, Oct. 17.

Tests of Concrete.

On page 376 of the issue of Sept. 29th appeared some excellent notes on mixing concrete, the result of U. S. engineering tests at Duluth, Minn.

It is to be further noted that the U. S. engineers there adopted a plan for determining the real tensile strength of cement when used in concrete.

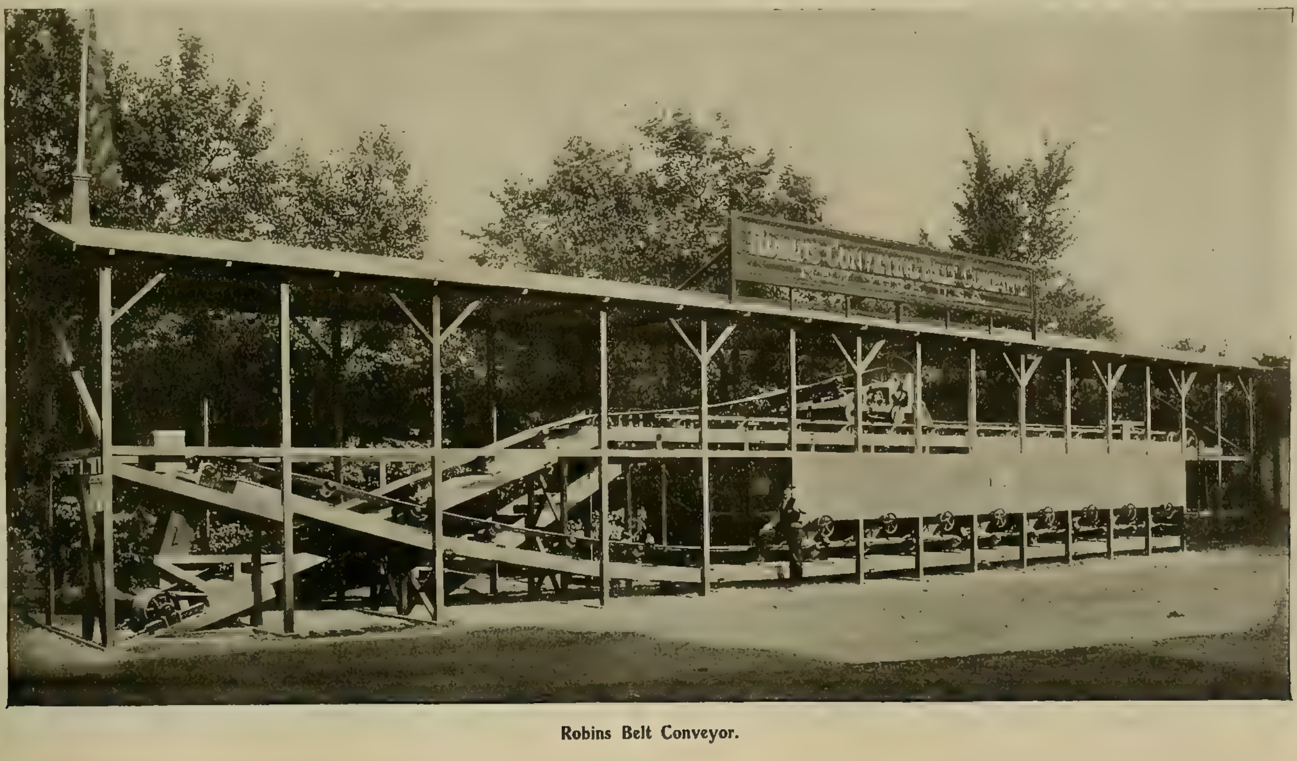
During the construction of the concrete footing blocks samples of the concrete were taken from the mixing platform as mixed, from which briquettes were made. These briquettes were treated as nearly as possible to conform to the treatment of the concrete in the footing blocks. The results obtained were satisfactory. In making these briquettes it was necessary to remove pebbles more than ¾ inch in their greatest diameter to permit the concrete to be compacted into the briquette molds. It was found on breaking those briquettes that at twenty-eight days and thereafter pebbles imbedded in the mortar at the breaking section were almost invariably broken. It will be seen from the table that the mean tensile strength of five briquettes, one year old, was 643 pounds. Assuming a coefficient of 7 for strength in compression would give 4501 pounds per square inch, or 324 tons per square foot, as the ultimate resistance to destructive stress in compression. The following table shows the tensile strength of briquettes at different ages:

Age.	Pounds per square inch.
7 days	222.4
28 days	388.4
6 months	414.6
1 year	643.0

Robins Belt Conveyor.

The engraving on this page shows an exhibit of the Robins Conveying Belt Co. of New York City at the Vincennes machinery annex of the Paris Exposition, for which the company was awarded a grand prize, announced as the only one awarded to any manufacturer of conveying machinery. It consists of a 20-inch Robins belt conveyor, 90 feet long, running level under a series of bins, after clearing which it takes a curved incline, elevating the material to a height of 7 feet, at which point it is delivered to a horizontal 20-inch conveyor, which carries the material in the reverse direction. On this upper line of conveyor a patent tripper operates, distributing the material into the bins, reversing automatically at each end of the bins and requiring no attendance. The capacity of the system is 200 tons per hour, and it is constantly in operation, handling broken stone.

The company also makes two other exhibits, one in the machinery and electricity building, consisting of two 20-inch conveyors 35 feet long, and the other in the mining building, consisting of a one-quarter size model, including the automatic tripper, of the Vincennes exhibit. These exhibits are also in constant operation. In addition to the machinery, there is a large collection of photographs of Robins belt conveyors, showing installations in all the mining countries of the world. While some of the pictures were of interest to the Exposition crowds, it was the conveyors themselves that attracted the attention of all, especially those on which automatically reversing trippers were working. This invention had not been exhibited before in Europe, and the smoothness and regularity of its operation, requiring no attention, occasioned curiosity and interest. Special Exposition illustrated catalogues, in French and English, were distributed at each of the exhibits.



Robins Belt Conveyor.

Successful Working of Cement Gravels.*

Written for the Mining and Scientific Press by
G. E. Bailey, M. E.

The famous "blue gravel" deposits that cover large areas in the placer districts of California have been for years the torment and despair of the miners. The practical miner cares little as to whether they are the result of glacial action, or torrential erosion, or of some other cause, for he does know that they have been deposited by some means in the ancient channels of mighty rivers. He knows, also, that the gold is more uniformly distributed in them than in the more recent gravels, and that they yield higher returns in gold per yard or per ton.

In some places they are capped by lava, sandstone and other recent formations to a depth of 400 feet and over, and have to be mined like a coal vein. Their values run from $2 to $20 per ton, the aggregate in California being estimated by official reports as $400,000,000.

The blue gravels are so hard and compact that they are commonly called "cement." They are too hard to be reduced by the highest available heads in hydraulicking. Stamp mills have worked at a profit on them in many places in the State, but this is a wasteful method, as the barren boulders have to be crushed as well as the bonding material, which alone carries the gold. The Adele Mining Co. have been carrying on a series of experiments in Trinity county since last July that have proven successful, and their methods are of interest throughout the State. The mill proper consists of six grizzlies, arranged so as to form a barrel 6 feet long by 6 feet diameter. The corners of the grizzlies do not join, but overlap, with a 3-inch space between. Outside of and surrounding the grizzlies is a set of screens, $\frac{1}{16}$ mesh. The cement is fed into the barrel through an opening some 22 inches in diameter, and the boulders and coarse gravel are discharged at the opposite end through an opening slightly larger than that of the feed end. The barrel is slowly revolved, making from twenty-five to thirty revolutions per minute. In this way the cement is tumbled over and thrown down on itself, rubbing, crushing and grinding the bonding material, but not crushing or wearing the boulders or coarse gravel. Water pipes from a tank set 6 feet higher than the mill throw jets and sprays with considerable force upon all portions of the material being treated, assisting in softening the cemented matter and washing the boulders and smaller gravel absolutely clean.

The pulverized bonding matter passes through the grizzlies onto the screens, and then goes with the water to the amalgamators. If any particles are too coarse to go through the screen they soon slide back into the barrel at the corners where the grizzlies overlap. The speed and the feed being quickly adjusted, it is found that the mill remains about half full, the blue gravel being fed into the mill in a constant stream at one end, and from the other comes a steady stream of absolutely clean boulders and gravel. The gravel as it comes from the mine runs from 50% to 60% boulders and coarse gravel that carry no gold, and all of this is discharged from the machine uncrushed and thoroughly washed, no cement adhering to the rocks.

The capacity of the mill has exceeded the expectations of the company. With the very hardest material it works from nine to eleven tons per hour; upon the medium material it has a capacity of from fifteen to twenty tons per hour, while upon what is called soft material, or that usually found hard to pipe in ordinary placers, its capacity depends wholly upon one's ability to get the material to the mill and away from it.

The Amalgamators.—The amalgamators consist of two tables 4 feet long by 3 feet wide, composed of trays and fine riffles. These tables are adjustable for grade and speed. They are given a gentle side shake of 300 vibrations a minute. The riffles are filled three-quarters full of mercury. No mercury is floured or shaken over. In fact, these machines would make good amalgamators in a stamp mill. In Trinity county it was found that a considerable percentage of the gold saved would pass through an 80-mesh screen, and nearly half of this would pass a 100-mesh screen, showing that the fine gold is saved.

The capacity of each of these amalgamators has been found to be from three to six tons per hour, according to the percentage of black sands and sulphurets in the gravel. As from 50% to 60% of the material going to the mill does not reach the amalgamators, two of them are enough for one cement mill. The agitation of the pulp keeps the sand in suspension, while all of the gold is brought into contact with the mercury.

The riffles are $\frac{5}{8}$ of an inch wide by $\frac{3}{4}$ of an inch deep. The trays are quickly removed for cleaning up, extra ones being put in their places, and the stoppage of the plant being only a few minutes.

Black Sands.—The Trinity cements carry a large percentage of valuable black sands. Owing to the large quantities of pulp handled per hour, it was found that it would take too large a plant at the present stage of the work to use the concentrators now in the market. The process adopted during the experiments was as follows: A revolving screen was placed below the amalgamators to remove the coarser sands, as all of the black sands are in small grains, then the pulp goes on to a moving carpet table, where clean water is added. The result is a partially cleaned concentrate that is piled up to await final treatment later on with some of the standard tables. At all events, the black sands are kept from going into the river. Test shipments of quantities of the sands to the smelter show that the sands will form a considerable item in the profit column.

Sulphurets.—Considerable sulphurets have been found in the cements near bedrock, but there has not been time yet to fully determine their true value. It is possible that they are of secondary formation, having recrystallized in the deposit instead of being the original sulphurets brought there by erosion from veins. If this proves to be the case, the concentrator adopted for the final cleaning must be one that makes two grades of headings, saving the black sands and their gold and eliminating the sulphurets. This is a point worthy of noting in other mines.

The Mine.—The mine on which this plant is located presents some features of general interest. The cements here form the false bedrock of an hydraulic placer that has been worked for years, so that mining the cement is really a question of open quarry work. On going down on the hard blue cements it was discovered that the bedrock was pitching at a rate of 20°, and that below the hard was a 7-foot stratum of soft blue gravels that could be handled rapidly with pick and shovel alone. This made it easy to run in drifts and fired, small bank blasts breaking down and shattering the hard cements in large quantities, the problem, then, being simply one of tracks, cars and hoist.

In General.—A few general points are worth noting. This class of mills should not be expensive, considering their capacity. As the ore falls on ore, and the process is a rolling one, the wear and tear of the steel bars and steel end liners to the mill is insignificant when compared to any other style of machine. A 30 H. P. engine and a 45 H. P. boiler is ample power for the hoist, pump and plant. The quantity of water necessary depends upon the quantity of material put through. The green and black sands are heavy and the hard cements require 200 gallons per minute, the mill handling ten tons per hour, and larger quantities will be in proportion. All launders, etc., must be made unusually steep. Instead of a car, future machines will probably use some form of link belt conveyor for taking the boulders away from the machine. The machine described was made for the Adele Co. by the Krogh Manufacturing Co. of San Francisco. Since the photos were taken the machinery has been enclosed and some minor additions made. The total expense of mining and milling, at ten tons per hour, is less than 30 cents per ton.

Pumping Oil in Colorado.

At Florence, Colo., the Oil Well Supply Co. of that place has put in a pumping station such as is in general use in Eastern oil fields, but new in Colorado or California. It consists of a perpendicular shaft upon which are two eccentrics with numerous holes in them for attaching the wire line that runs from the power to an iron jack at each well. It is mounted on an iron frame bolted to a stone and cement foundation, made on a slope corresponding with the lay of the surface, and operated half a mile from some of the wells. It receives its power from a gas engine 30 feet away, which takes its gas supply from one of the producing wells. All that is required to start all the wells that are attached to the plant is to start the gas engine and throw on the friction clutch, which starts the shaft on the power to revolving, and the eccentric motion given to the wire pulls up the sucker rods at the wells, just the same as if there was an old-style engine and boiler there. It will pump as many wells as there are holes for wires to be inserted. If there are 100 wires and holes, it will pump as many wells; one man is required to operate the plant; under the old style of pumping it usually required one man to each well.

The average production of each well drilled in the Florence district is 100 barrels per day.

Forester Pinchot of the Department of Agriculture says the age of the big trees on the western slope of the Sierra Nevada mountains makes them the oldest living things. Before the glacial period the genus of big trees called Sequoia flourished widely in the temperate zones of three continents, and Europe, Asia and America each had its share. But when the ice fields moved down from the North the luxuriant vegetation of the age declined, and one after another the different kinds gave way until only the big trees and the redwood survived. These trees have come down to us through the vicissitudes of many centuries, solely because of their superb qualifications. Their bark is often 2 feet thick and almost non-combustible. The oldest specimens felled are still sound at heart and fungus is an enemy unknown to it. Yet the big trees have not increased their range since the glacial period, and have just managed to hold their own on the little strip of country where the climate is locally favorable.

Interior Department Ruling.

The Secretary of the Interior has denied the motion for review filed by C. F. Blake and others for patent to the Calumet lode mining claim and mill site, Survey No. 710 A and B, Boise. On May 19, 1900, the land department held that these applicants had, by reason of their delay of nearly seven years after the expiration of the period of publication of notice of their application, and no further effort being made for final entry, forfeited all rights acquired under the previous proceedings upon application to get patent. It was held, however, that they should commence patent proceedings anew if they so desired.

In this motion for review it was contended that the decision of May 19, holding that the applicants had lost all rights by not having completed their application within a reasonable length of time, was erroneous, as such a ruling was contrary to the uniform decisions of the courts, to the effect that a properly located mining claim constitutes a property right and estate of the locators, or their guarantee, and gives them the exclusive right of possession.

"The department, however," says the Secretary, "did not claim in its decision that the applicants 'have not exclusive right of possession and enjoyment of their claim, and by virtue of the location thereof.' On the contrary, it was stated in that decision: 'As to the question whether the appellees have or have not performed the conditions necessary to the maintenance of their possessory rights under the location, the land department has nothing to do with such matters, and can make no determination with respect thereto. Its duty is to administer those provisions of the mining statutes which relates to proceedings of obtaining patent from the Government, and it is with reference only to the application for patent, and the proceedings had thereon, that any determination is intended to be made in this case.'"

Thus, according to the decision of the Secretary, there is nothing in the contention that the possessory rights of the mineral claimants have been injuriously affected by the action taken by the department in the former decision, as it was with respect to their rights as applicants for patents that the department dealt in this decision of May 19, 1900. It was not held that the claimants had waived their possessory rights, but on account of their delay had waived all rights acquired by the earlier proceedings upon their application and could take nothing under those proceedings, but that they could renew proceedings for patent should they so desire. Under these circumstances, the Secretary decided that there was no reason for entertaining the motion for review, and it was accordingly denied.

Electrical Machinery in South Africa.

The British and South African Export Gazette says that during the last ten years on the gold-bearing reefs of the Witwatersrand a marvelous collection of machinery of all sorts has been installed over a section of country about 40 miles in length. There is yet room for a great deal more, as many of the small mines have never been properly developed and many of the large mines have neglected their extensions and deep levels. It will not be many months before the mines will be again occupied and the question of new electrical machinery gone into. Then it will be seen how much of the old machinery has been irreparably damaged by neglect and by water; and, inspired by confidence in the new state of things, orders will go out broadcast for this machinery and for plants which the mines have been waiting for years to put down. New schemes will be taken in hand, new districts developed, and every bit of machinery will be wanted at once.

Inventor of the "V" Flume.

By the death of J. W. Haines the inventor of the "V" flume passed away. Haines was in the wood business in Washoe in the early days and constructed a box flume to carry wood out of the mountains. The square flume didn't work. Haines looked over the big line of boxes and turned one sidewise. He found that the water was confined to less space and less room for friction. The order was given to turn the whole length of flume on its side, which was done, and the result was that the wood went booming down the hill. From that day the transportation of wood from the steep canyons has been done by means of Haines' "V" flume, and although no patent was ever taken out it proved the greatest invention the woodmen ever had.—Virginia, Nev., Enterprise.

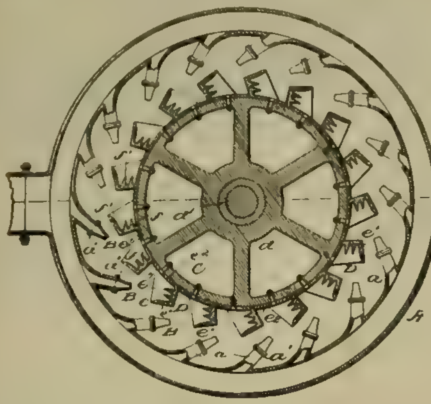
Several Colorado mine shafts are being equipped with cages having safety chairs attached, to prevent accidents to cages in passing down the shafts. By their use the old method of a set of chairs for each landing is eliminated, the chairs being carried attached to the cage, and are always under the control either of the cage man or the station man. The chairs, which are flanges, which may be thrown out at will, are designed to prevent accidents and loss of life through neglect to remove stationary chairs from the landing, upon which the cage would drop with force in the descent, often crushing the cage and injuring or killing the occupants.

Mining and Metallurgical Patents.

Patents Issued October 16, 1900.

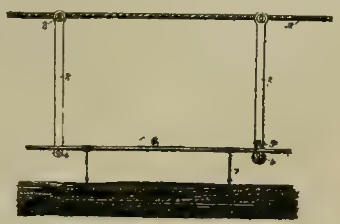
Specially Reported for the MINING AND SCIENTIFIC PRESS.

IMPACT WATER WHEEL.—No. 659,652; J. R. De Remer, Glenwood Springs, Colo., assignor one-third to H. D. Crippen, Denver, Colo.



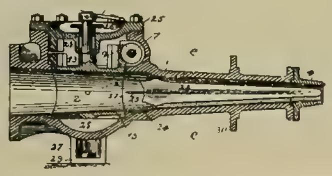
Combination with wheel, of series of buckets mounted on periphery thereof, having each open end, buckets composed of inner and outer walls and curved connecting wall, inner and outer walls divergently arranged in relation to each other from their union to curved portion of connecting wall, latter wall flattened at tops of inner and outer walls, ribs formed with curved portion of connecting wall, inner sides of ribs substantially parallel with outer wall, outer sides substantially parallel with inner wall of bucket.

CONVEYOR FOR ROPEWAYS.—No. 659,745; Andrew S. Hallidie, San Francisco, Cal.; Martha E. Hallidie executrix of said Andrew S. Hallidie, deceased.



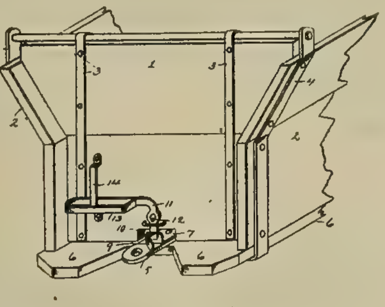
Endless traveling rope tramway carrier consisting of hangers, means for supporting and connecting hangers with traveling rope, hinged arms projecting approximately horizontal from one or both hangers, pole adapted to rest upon and be supported by arms, slings within which bundles are maintained, means for securing slings to pole, latch mechanism by which one or both arms are disengaged so as to drop bundle at delivery station.

HYDRAULIC NOZZLE.—No. 659,794; W. A. Doble, San Francisco, Cal.



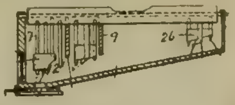
Hydraulic nozzle, main tube of tapering bore, recessed transverse circular chamber formed integral therewith adapted to receive revoluble valve, latter chambered or out of contact at sides and ends, provided with removable faces to fit upon and close bore of nozzle toward discharge end thereof; in main tube with tapering bore, member 22 mounted contentrically therein, provided with thin radial vanes extending toward but not reaching inner surface of nozzle, and extending longitudinally near to or beyond tip or point of issue.

MINE CAR LATCH.—No. 659,777; A. C. Walters, Uniontown, Pa.



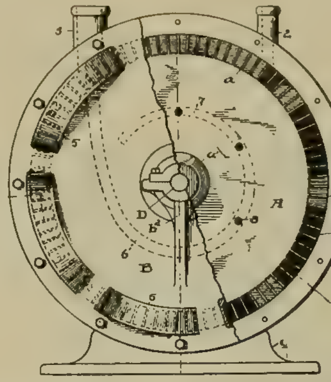
Latch for mine cars, consisting of keeper, formed from plate 7, attached to coupling bar 5 of car, keeper having portion bent at right angle and inclined part 9, latch bar 11, pivoted to end gate, adapted to engage with keeper, provided with handle portion 13, strap 14 for guiding and holding bar in position.

ORE WASHER AND SEPARATOR.—No. 659,813; E. W. Eaton, Socorro, New Mexico.



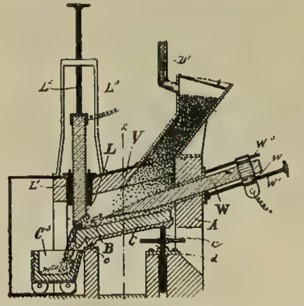
An ore washer and separator, a tank having overflow opening and lower discharge opening, water supply vessel mounted on tank provided on under side with pulp-stirring arms, mechanism to rock vessel and stir pulp, part of arms being hollow to convey water from vessel to near bottom of tank, having discharge ends bent toward concentrate discharge end of tank, and partitions extending from top of tank to level below overflow opening.

STEAM TURBINE.—No. 659,930; D. Kemble, Cleveland, Ohio. Filed Nov. 17, 1898. Serial No. 696,686.



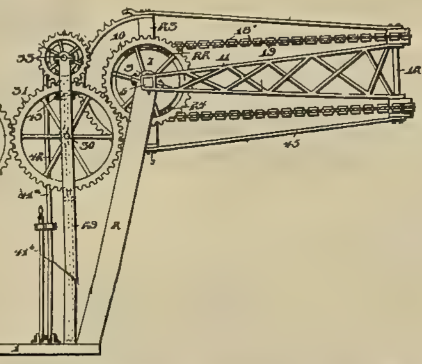
A steam turbine casing having two sides and series of ducts successively in each side curved in direction of length arranged successively to form sinuous circular channel, in combination with single disk-shaped wheel having series of radially disposed vanes on its periphery full width of wheel and full depth of channel, length of curvature of ducts constituting steam channel being such that at each point where steam traverses periphery of wheel it will strike series of vanes.

ELECTRICAL FURNACE.—No. 660,043; W. Borchers, Aachen, Germany.



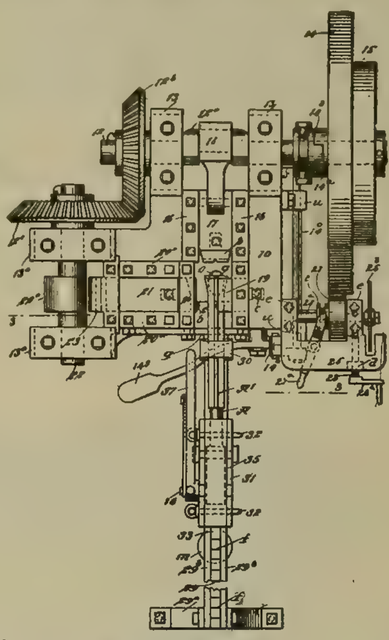
In an electric furnace, combination of furnace structure, pivoted hearth therein, means for tilting hearth to vary its angle of inclination, electrode disposed over lower end of hearth, tapered electrode disposed longitudinally over hearth adjustable toward and from other electrode, means for feeding material to be heated onto hearth and over and past tapered electrode, and electrical connections for establishing arc between electrodes.

MINING MACHINE.—No. 659,984; E. O'Toole, Leisenring, Pa.



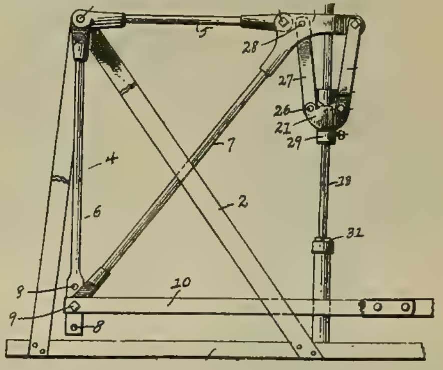
Coal mining machine, combination with base and inclined supporting standards, of rock shaft mounted in standards, vertically disposed shaft 23 connected centrally the ends of rock shaft, miter gears 22, 24 loosely mounted on shaft 23, miter gears 6, 7, loosely mounted on rock shaft for engagement with gears 22, 24, frame mounted on ends of rock shaft, guides carried by frame, endless cutter chains disposed one above the other, operating through guides engaging gears 22, 24, means connected to miter gear 7 for driving train of miter gears and operating chains, vertically disposed rotating worm, segmental rack connected to shaft 23 engaging worm, means for shifting rotation of worm to impart oscillatory movement to cutter chains simultaneously with endless travel.

DRILL FORGING AND SHARPENING MACHINE.—No. 660,009; W. J. Evans, Butte, Mont.



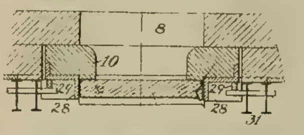
Drill forging and sharpening machine, combination with plurality of dies adapted to upset and sharpen cutting edges of a four-winged drill, drill supporting device comprising horizontal guideway, carriage movable on guideway, means to hold carriage at different points on guideway, cam head held to rock on pivot shaft between uprights on carriage, handle arms on pivot shaft of cam head adapted by manipulation to rock cam toward end of drill shank to feed it up against impact of edge-sharpening die.

OIL WELL JACK.—No. 660,059; R. W. Hudson, Toledo, Ohio.



Pumping jack three-part frame suitably supported upon standards, surface rod connected therewith, hinges formed at two angular points of frame, means for disconnecting frame at third point, bifurcated extension on frame having inwardly extending recess, cradle formed with inwardly extending recess, straps pivotally attached to forward sides of cradle and to forward sides of bifurcated extension, strap pivotally attached to rear of cradle and also to rear of bifurcated extension, reciprocating polish rod adapted to occupy recesses in cradle and bifurcated extension, collar on polish rod having lower bearing points adapted to fit into recesses in top of cradle whereby working parts of jack are capable of being removed from proximity to polish rod.

METALLURGICAL FURNACE.—No. 659,941; W. Swindell, Allegheny, Pa.



In metallurgical furnace, combination of combustion chamber having charging opening in wall, stay bars fixed to walls, door frame having body of refractory material fitting in recess of wall of combustion chamber around charging opening, metallic facing strips connected to body, keys bearing on facing strips and on stay bars of wall, securing door frame removably to combustion chamber, door fitted to traverse between facing strips and control charging opening.

Machine Mine Rock Drills on the Pacific Coast.

NUMBER III.

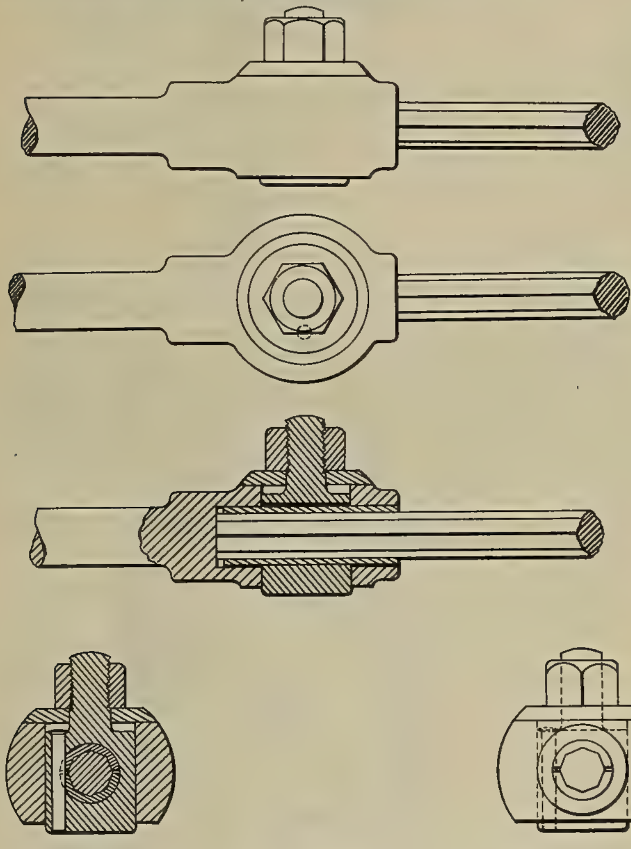
Written for the MINING AND SCIENTIFIC PRESS by A. E. CHODZKO.

"GIANT" ROCK DRILLS.—Compressed Air Machinery Co., San Francisco: Valve motion, tappet; feed, hand; rotary motion, stationary pawls, movable ratchet head.

Valve motion: The plain slide valve used in this machine is now being superseded by a different arrangement, consisting of a balanced piston valve, both ends of which are fitted into cylindrical chambers, open to atmosphere when the drill is working at full stroke. This type of valve is claimed to reduce the wear of the tappet.

When it is desired to beat at reduced stroke a turn of a cock replaces atmospheric by working pressure into the rear valve chamber, thus throwing the valve forward as soon as the tappet is relieved of its contact with the main piston. This arrangement aims at the same object as the Gleeson device, described in connection with another local machine of the same type.

Rotary motion: The ratchet head, keyed on the rifle bar, has teeth symmetrically shaped, and which, when worn on one side, can be used on the other by changing the setting of ratchet head on bar, end for end. Pawls pivoted into hardened steel bushings take up the thrust and prevent cracking of the back head, which was of frequent occurrence prior to their adoption.



"Giant" Rock Drill Chuck.

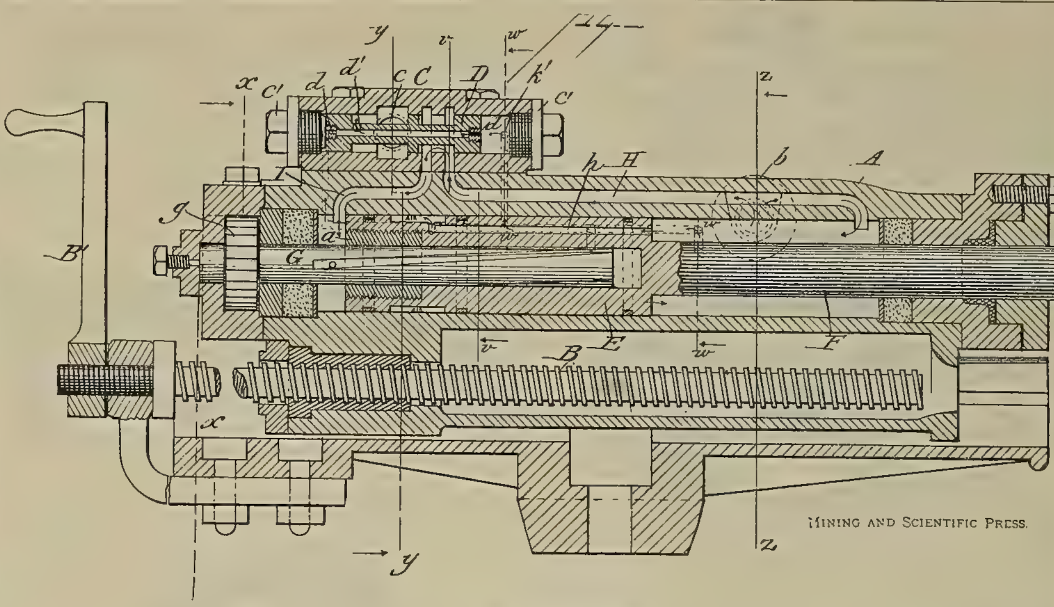
Shell strips: The cylinder is cast, as usual, with side slides moving longitudinally into corresponding grooves carried by the shell.

The upper part of each groove is here made of a bar held down by cap screws passing through oblong holes, and bearing against a ridge cast with the shell. As cylinder slides are working loose, bars are made adjustable by slackening the screws and shimming up between bar and ridge, then jamming the screws again.

Clamp: The shell is cast with an inverted conical recess, i. e., the larger diameter inward and the smaller diameter outward. The clamp connecting the shell to tripod or column carries a boss of the same shape as recess, one half of which is stationary, while the other can be moved nearer to or farther from it by acting on a single bolt. When both halves are brought together the boss can be engaged into the recess of the shell, and then, by tightening up the bolt, they are spread apart, which sets the clamp.

Chuck: Instead of the bolt generally used for jamming the half bushings in the chuck around the shank of the bit, a single bolt is here used for this purpose, the claim being to avoid the frequent breaking due to unequal tightening of the bolt's nuts.

A goose neck and special clamp are also used for connecting the air hose to the machine. They have been illustrated and described in a former issue of this paper.



The Cummings Drill.

THE CUMMINGS DRILL.—Valve motion, Eclipse type; feed, hand; rotary motion, stationary pawls, movable ratchet.

This machine was designed to work upon the double pipe system, the exhaust air leaving the drill at a pressure considerably above the atmospheric, and being returned to the compressor through a closed pipe. In this respect the Cummings drill is at marked variance with all the other machines in use at the present day. An application of it, mentioned in this paper some months ago, is reported by the inventor as made with 220 pounds live pressure and 100 pounds return or exhaust pressure, all effective, the average speed of the machine being 300 blows per minute.

In its general appearance, this machine does not differ from the more familiar types of rock drills. In fact, no particular feature is claimed for the feed and the rotary motions; neither is any special design recommended for the shell, clamp, column or tripod, machines of this system having occasionally been used with other makes of these several pieces.

The Cummings drill receives permanently the live pressure on the front end of its piston, whose working size is therefore that of its rod at the stuffing-box.

At the same time, the valve chest is removed near the rear end of the cylinder, the object being to shorten the rear port, and thus reduce the clearance, of which there is none at the front end.

The piston valve is operated by admitting live pressure at the proper time into the end casings of the valve chest, through separate ports, of which the other ends are alternately covered by the main piston, or put in communication with the live pressure. These end casings exhaust through a passage drilled clear through the valve, communicating with the main exhaust of the cylinder. The scope of this article would not admit of a comparison between the double-pipe system and the ordinary way of operating rock drills; besides, the former applies to any kind of pressure motors, of which rock drills are only one particular case, and a treatment of this subject would unavoidably extend beyond what the title of these remarks implies.

It is, moreover, noteworthy that the double-pipe machine is the only one where an effective attempt can be made to complete expansion without the use of a reheater.

THE FIRTH DRILL.—Valve motion, auxiliary valve; feed, hand; rotary motion, stationary pawls, movable ratchet head.

Valve motion: Operated direct from the piston, the auxiliary valve resting on a tapered part of it, with a hard steel ball interposed.

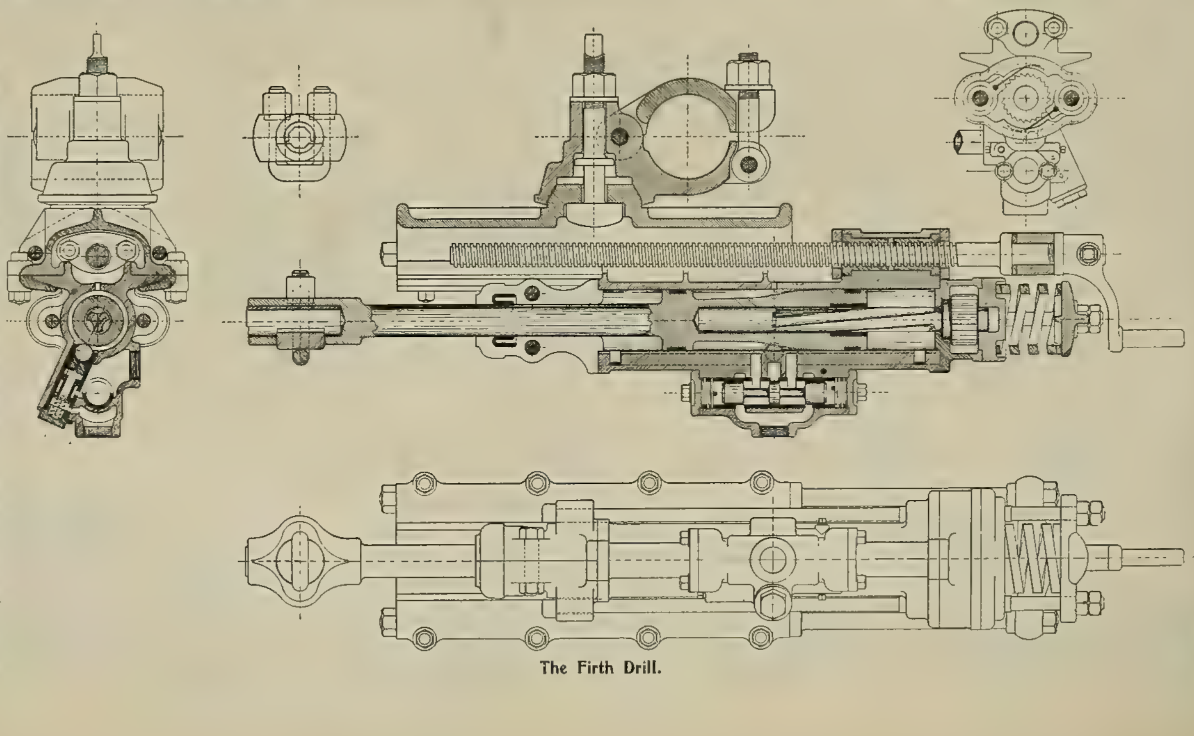
Valve seats provided with a liner, which can be changed, when worn, without removing the entire valve chest, the latter being cast with main cylinder.

Rotary motion: With hardened steel reversible pawls swinging on head bolts.

Adjustable feed nuts to take up wear of feed screw. The side guides of cylinder are engaged into corresponding solid V-shaped grooved bars, secured to cylinder by means of excentrically turned bolts, so that a slight angular motion of these will move the whole guide bar towards or from the cylinder guides.

Cast steel clamp of the Ingersoll type, with T-headed bolt which a partial turn can engage or disengage from shell.

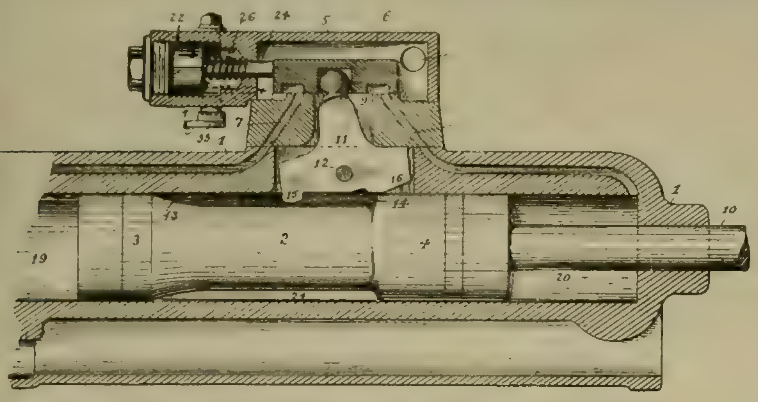
RIX DRILL.—(See Fig. "The Gleeson Device.") Valve motion, tappet; feed, hand; rotary motion;



The Firth Drill.

pawls pivoted into head solid with rifle bar, and turning with same; stationary ring with ratchet teeth in back head of cylinder.

Valve motion: A plain slide valve is used, operated by the tappet in the usual way; but the possibility of beating at reduced stroke is assured by a special addition, known as the Gleeson device. This consists of boring out a portion of the rear end of the valve chest, to form a small cylinder, in which is a plunger, marked 22, having attached a stem, 24, around which is wrapped a spiral spring, 26. The device is acting when the stem is brought in contact with the valve; it becomes inoperative when this contact ceases.



The Gleeson Device.

The small cylinder is capped by a brass plug, as shown, and on one side of its forward portion there is a plug cock, 33, with a handle about 1½ inches long. The stem of the plunger has a working fit into the rear end of the valve chest, as also the plunger into its cylinder; but the air pressure will pass around them to some extent.

When the device is inoperative and the drill works at its normal stroke, the pressure acts on both faces of the plunger, which, being balanced, is pushed back by the spring, 26. But if the cock, 33, is given a quarter of a turn the chamber in front of the plug is open to atmosphere, while its back end is under pressure, overcoming the action of the spring, 26, presses the plunger's stem against the valve, 6, thus throwing it forward as soon as the tappet abandons it.

What little air would leak into the front chamber of the plunger escapes continually, and the device remains operative until the cock is turned back, when the plunger is instantly thrown away from the valve, 6, and becomes inoperative.

The general features previously described are here retained, a distinctive detail being that the ratchet teeth are out on the inside of the rear end of the cylinder, thus dispensing with a separate ratchet head.

No adjustment is provided for the slide bars.

The bolt use for the chuck has a releasing wedge on top of it.

The recess for connecting shell to clamp is made in the latter, which is machined in every bearing.

This machine was designed as and is claimed to be a one-man drill.

Another feature consists in an adjustable connection between the air hose pipe and the drill, by means of a ½-inch pipe, passing clear through the valve chest, perforated with ⅛-inch holes to the extent of its area, and jammed into position by a bronze nut at its outer end. The hose coupling is permanently closed, and connecting to the drill is made to suit any inclination by loosening the brass nut and jamming it again after proper setting.

(TO BE CONTINUED.)

Poisons; Their Nature and Effect.

A poison is any substance which, when taken into the body and absorbed, or by its direct chemical action upon the parts with which in contact, or when applied externally and entering the circulation, is capable of producing deleterious effects. There is no doubt that all poisons are to a greater or lesser extent absorbed into the circulation. In fact, with most of them this is certainly a condition essential to the production of their effects; yet it would appear that in the action of some substances, which produce local chemical changes, death, in some instances at least, can be referred only to the effects of the changes thus produced. The mineral acids and caustic alkalies are the principal poisons which have a direct chemical action upon the parts with which they are brought in contact. This action is due to a mutual affinity existing between the agent and the tissue. In this respect the action of these substances differs from that of certain heated liquids, such as boiling water, which are inert at ordinary temperatures, but which, simply on account of their condition, induce a chemical change in the part to which they are applied, without themselves being chemically concerned in the change. When applied externally, some poisons are absorbed by simply being brought in contact with the unbroken skin; while others do not enter the circulation unless applied to an abraded or wounded surface.

Poisons differ greatly in regard to the quantity necessary to prove injurious. Thus, the fiftieth part of a grain of aconitine has seriously endangered the life of an adult, while, on the other hand, an ounce of magnesium sulphate may generally be administered with impunity; yet in large quantities the latter substance has in several instances caused death, and is strictly a poison, although not commonly reputed as such. As yet we know of no substance that is poisonous in every proportion. Any of the most powerful poisons may be administered in certain quantities without producing any appreciable effect, and most of them may be so employed as to constitute valuable remedial agents.

In medico-legal inquiries, the leading idea connected with the term poison is whether the given results are directly traceable to the substance and the intention with which it is employed.

Poisons do not differ from each other in regard to the quantity necessary to destroy life; but the effects of the same substance may be much modified by circumstances, and even substances which to most persons are harmless may, on account of certain peculiarities of constitution, produce deleterious effects.

An Electric Staircase.

At the Fifty-ninth street station of the Third avenue line of the Manhattan Railway Co. in New York City is now being given a test of an electric staircase or inclined elevator, made by the Reno Inclined Elevator Co., New York City. Similar apparatus have been put in department stores in New York, Philadelphia and other cities, and the device has attracted attention at the Paris Exposition.

Fig. 1 illustrates the elevator in position at the station; Fig. 2 is a section showing how the moving platform ends at its upper and lower extremities. The hand rail moves along with the inclined floor of the apparatus, and at the same speed, so that the passenger simply steps on the moving incline, resting his hand on the hand rail, and is carried at a moderate rate of speed to the upper or lower floor, thus doing away with the ordinary labor of "climbing stairs."

The surface of the incline consists of a series of shallow longitudinal rubber-covered ridges, which at the top pass between the prongs of a comb-shaped landing, as shown in Fig. 2. In this way the passenger is slid out upon the landing without danger of accident, such as a woman's clothing being caught.

It is calculated that the average New Yorker climbs about 20,000 feet a year up the elevated stairways. These elevators have a capacity of 3000 passengers each per hour. Small electric motors will furnish the power requisite for their operation.

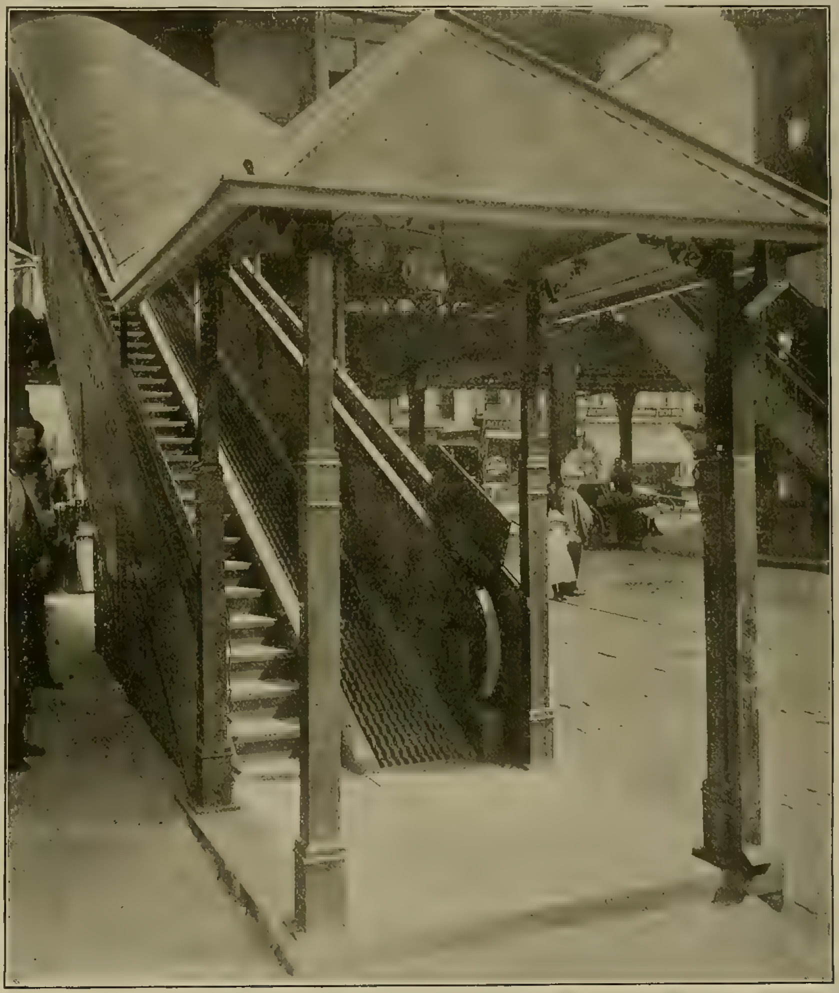


Fig. 1.—Elevator in Position at Station.

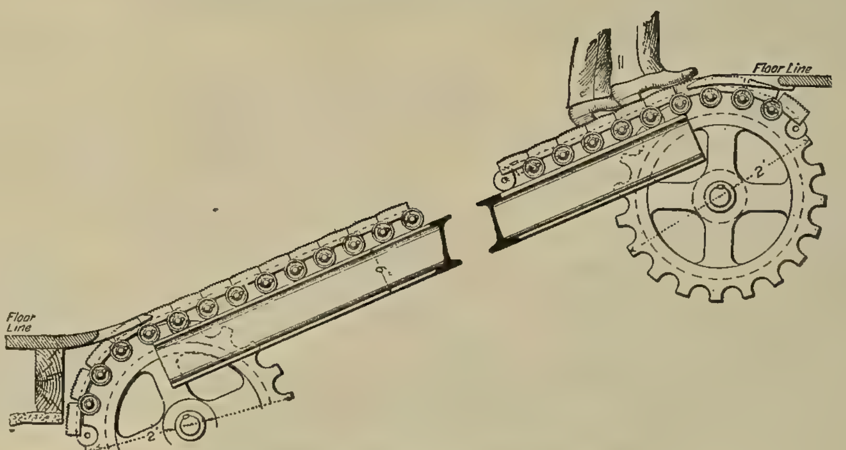

Fig. 2.—Section Showing How Moving Platform Ends.

MINING SUMMARY.

ALASKA.

The Ebner mill, in Gold Creek valley, near Juneau, is dropping fifteen stamps.

A 12-drill air plant will be installed at the Jualin, Berner's bay.

Replacement of the foundations of the 240-stamp mill at the Alaska-Treadwell will be completed in November.

The U. S. telegraph system will be completed from Nome to Tanana by Jan. 1. The line from Dawson northward to Eagle, on the American side, will be completed Dec. 1.

The Cape Nome G. M. & T. Co. is working the tundra adjoining the beach 7 miles from Nome City. The small companies are waiting to see the results of the experiment. The company owns twenty-one claims and employs thirty men. The shaft near the beach is down 60 feet to bedrock and a tunnel runs under the sea. The ground soil on bedrock is wash gravel and mica schist. Everything taken out is being run through sluice boxes. What they are trying to locate is an old river bed which they believe is under the tundra.

ARIZONA.

COCHISE COUNTY.

The Eastern & Montana Development Co. will resume work on the Silver Bill group, near Turquoise.

The Copper Crown Co., Supt. Blackburn, is pushing work on its mines in the Dragoons, near Tombstone.

GILA COUNTY.

The Minneapolis M. Co. will resume operations near Globe.

Six miles west of Globe, in the Pinal mountains, the new deposit of turquoise is being worked.

The Troy Copper M. Co., Troy (formerly Skinnerville), C. H. Cutting manager, will crosscut at 300-foot level. Thirty men are employed.

GRAHAM COUNTY.

The Arizona Copper Co. will put in a 200-ton concentrating plant at the Longfellow mine and will remodel the old reduction works, Clifton.

MARICOPA COUNTY.

The tailings from the Trilby mill, Wickenburg, will be run through a 20-ton cyanide plant.

MOJAVE COUNTY.

The new 300-ton concentrator for the Wallapai M. Co. will be erected on the old site at the Tennessee, Kingman.

Men are at work on the Minnesota, Chloride, timbering, etc. Operations will be resumed in near future.

It is reported that the Elkhart, Chloride, will start up before first of the year.

The water shaft at the Maguire mines, Chloride, is down 50 feet, furnishing 25,000 gallons water daily.

Turquoise mines near Mineral Park ship twenty-five pounds gem stones weekly to New York.

PIMA COUNTY.

The report that the Helvetia Copper Co. is about to erect a second 150-ton smelter is unconfirmed. During July, August and September the smelter was run about half the time and turned out an average of 100 tons of fine copper per month. The ore ran from 5% to 7½% copper, and with the gold and silver averaged $19 per ton. To date the Helvetia Co. has sold about $150,000 worth of copper.

PINAL COUNTY.

The Chief & Century group of mines, south of Casa Grande, is bonded to a New York company. The properties are being developed under the superintendence of C. B. Attex of Tucson.

The double compartment working shaft at the Troy mines is 200 feet deep, and Supt. Cutting says he will drive it another 100 feet.

SANTA CRUZ COUNTY.

The pumping plant at the Young America, Nogales, is nearly completed.

YAVAPAI COUNTY.

The Octave M. Co., employing 400 men, has forty stamps running.

The Verde Copper Co. is organized at Jerome, capital $3,000,000, to work property near there.

The United Verde Copper Co. this year paid $20,000 taxes.

The Hooper process, now in use at the Buster, Pine Grove district, Prescott, is reported a success.

At the Homerun, Groom Creek district, Prescott, a double compartment shaft is down 100 feet in ore. J. O'Connell is owner and D. Monihon manager.

H. Blauvelt is sinking on the Monte Christo, in Groom Creek district, Prescott. He has put up quarters for miners and will push development work.

At the 100-foot level in the Treasure Vault ore shows steady increase in copper sulphurets.

Macklin Bros. will resume work at the Silver King, Groom Creek district, Prescott.

Linderman & Co. are working gold bearing gravel near Lower Lynx creek crossing, Prescott.

The new 40-ton smelter at the Verde Queen, Jerome, is in operation. At present it will only run about fifteen days each month. Forty-five men are employed at the mine and smelter. General Manager Bosworth, J. A. King, Supt.

YUMA COUNTY.

The Advance Gold Dredging Co., Yuma, will start dredging at the Potholes when river permits.

CALIFORIA.

AMADOR COUNTY.

The Bunker Hill shaft, near Amador City, has been unwatered and retimbered to 40 feet below the 600-foot level.

The Kennedy M. Co., Supt. V. S. Garbarini, has bought the old machinery of the South Eureka, Sutter Creek, for the Kennedy.

The Sargent, on the Mokelumne, near Sutter Creek, has an increased force working on the 700-foot tunnel.

The Balliol mines, W. H. Storms Supt., employs sixty-five men. A new addition to the sulphate house is being built.

At a depth of 25 feet, Dooley Bros. took out $9000 the past month on a prospect near the Newton copper mines, Sutter Creek.

The Defender mine, near Camp Contreras, has a new steam pump and will continue sinking.

BUTTE COUNTY.

G. L. Smith, Supt. Nimshew Gold M. Co., Nimshew, is working day and night shifts on the new tunnel.

J. F. Newsom has bought 116.88 acres on Feather river for dredging purposes for $11,688.

CALAVERAS COUNTY.

New foundations will be put under the compressor at the Lightner, Angels.

The dam of the Melones Co., at Robinson's Ferry, on Stanislaus river, is nearing completion.

The Mutual M. & M. Co., Col. U. J. Hussy, Mgr., is putting in machinery at the old Lucky Boy, on Dry creek, near San Andreas. Operations will probably resume in a few months.

EL DORADO COUNTY.

The Church, three miles east of El Dorado, is leased by C. J. Garland, of Oakland. New machinery will be erected, and operations resumed.

The Gazette hears that the 5-stamp mill on the Wagner mine is to be moved to the St. Clair mine at Kelsey.——Work is to resume soon on the old California Jack mine, near Georgetown. A new shaft will be sunk.——The tunnel on the Electric and Bright Hope mines is in over 700 feet.

FRESNO COUNTY.

The Confidence Oil Co. will build another rig for well No. 2.

INYO COUNTY.

Smith & Bell, of San Francisco, will build a boracic acid plant on west side of Owens lake.

Barnes & Anderson will build a 5-stamp mill at Willow Spring, near Citrus.

MARIPOSA COUNTY.

Work on the Buckeye Group, on Buckeye creek, near Bridgeport, will resume.

The Spencer mine and mill, Whitlock, John Bros. lessees, have closed down. Ten men are employed.

Sinking at the Mariposa, Mariposa, is resumed. The outlook for the mine is promising. The company is putting in a large hoist and will run two skips shortly.

The Hite's Cove M. Co., E. L. Foster Pres., will soon begin the erection of their cyanide plant at the Cove, near Mariposa. A new compressor will also be put in.

MONO COUNTY.

In the Standard Con. mine at Bodie, for the week ending October 13, 369 tons of ore were crushed. Amalgam produced, 1153 troy ounces. Tailings plant No. 1 treated 153 tons tailings during the week. Plant No. 2 treated 247 tons tailings.

NEVADA COUNTY.

The new electric plant is in full operation at the Reward mine. The mine has been pumped dry of water, sinking has been resumed in the shaft and two more pumps will be added to the mill.

PLACER COUNTY.

Work is resumed on the Azalea, near Blue canyon.

The tunnel at the Herman, near Westville, is in 300 feet on 1400-foot level. Two 3-stamp mills will be erected. Thirty-five men are employed.

PLUMAS COUNTY.

Independent: In the Lost Channel mine, near Cromberg, main tunnel is in 430 feet in hard rock. At a distance of 390 feet an upraise of 15 feet was made and blue gravel struck, showing gold in paying quantities.——W. Menifee of Alameda will start an incline on the Seminole, 2 miles south of the Lost Channel; he will employ men and put on machinery for hoisting.——Penman & Fitzgerald, at the Tefft hydraulic mine, are preparing for the water season.

SAN BENITO COUNTY.

The Hollister Crude Oil Co., Hollister, expect to start operations Nov. 15.

SAN BERNARDINO COUNTY.

Black Nugget mines, 20 miles north from Daggett, continue to produce gold in paying quantities. Latest report says three men took out ninety-one ounces in three weeks with a dry washer. This is ten ounces, or about $175 per week, to the man.

The Helene Copper Co. is incorporated in Arizona, to work copper properties in Camp Vera, 18 miles north of Barstow.

Sixty stamps will be added to the forty now in operation in the Gold Mountain mill, making a total of 100.

SHASTA COUNTY.

About 300 employes of the Mountain Copper Co., at Keswick, have struck for an eight-hour day at the same wages they have been getting for a ten-hour day on the day shift and nine hours on the night shift. Of those who decline to work, the miners have been getting $2.75 per day; machine men, $2.85; muckers, $2.50; timbermen, $3. The company declines to accede to the demand, and states it has enough ore on hand to run the smelter for a year.

Searchlight: The Old Colony Co. of New York and Chicago have bought the Paige group of gold quartz mines on Clear creek, 9 miles west of Redding; price, $100,000. The same company has bonded the Happy Jack group of patented claims for $30,000.

SIERRA COUNTY.

Six men are employed at the Ruby Quartz, Downieville, W. Wolf manager, and development is progressing.

SISKIYOU COUNTY.

A cyanide plant goes in at the McKean, 3 miles from Callahan.

The Montezuma and other river claims on South Fork of Scott river will be worked with dredger by New York men next spring.

At the Blue Jay mine, near Cole, the new 10-stamp quartz mill is in operation. Supt. S. J. Fore has twenty-five men making an upraise from the lower chute to the main tunnel and putting in a chute from the mine to the mill. The bullion will be retorted and smelted on the premises. The ore averages $12 per ton.

SONOMA COUNTY.

The Oakland yields monthly thirty flasks quicksilver and the Cloverdale forty flasks.

The Missouri is being opened by the Oakland Co.

TRINITY COUNTY.

Work on the Forest Queen, near Nash Store, is resumed.

TUOLUMNE COUNTY.

The Green Con. G. M. Co., Sugar Pine, has erected a new hoist at shaft No. 2, Green claim; their tunnel on Mt. Vernon is in 160 feet.

The management of the Riverside, near Columbia, expect to erect a mill and cyanide plant soon.

A 10-stamp mill will be erected on the Duleek, near Jamestown; W. Graham is Supt.

The Gagnere M. Co., R. L. Long Supt., will resume sinking near Tuttletown.

The new aerial tramway from Tuttletown to Angels will be running in ninety days.

COLORADO.

BOULDER COUNTY.

The Success Co., Ward, Wm. Coleman, Mgr., has new milling machinery at the pyritic smelter. Work will resume this month.

The Great Eastern G. M. Co., of Boston, Mass., J. E. Harrison, Jr., Mgr., will reopen and work the Melvina, near Selma.

The Colo. Springs Co., Chas. Johnson, Mgr., will put in a new plant at Tambourine mine, Four Mile creek, near Salina.

CHAFFEE COUNTY.

A compressor and air drills are being put in at the Queen City by the Nabob M. Co., Salida.

The Turret City G. M. Co., W. J. Root Prest., will resume on the Vivandiere, Turret.

Work on the Jasper, Turret, is progressing and good ore is being mined.

CLEAR CREEK COUNTY.

The Big Alice, near Yankee, will resume.

The Cumberland, near Yankee, has resumed.

The Oro Verde Co., Yankee, has installed new electric drills, and a gasoline engine. A large ore bin will be erected.

Changes are being made in the Wilkie mill, Idaho Springs, by the Crown Point-Virginia Co. It has installed a blower with 15-inch outlet.

Omaha men propose to tunnel the Continental divide 12 miles south of Georgetown and operate an electric road through it. It would start at the base, about 14 miles from Grant, and terminate at the headwaters of the Snake river, and would be 7000 feet long and 1700 feet deep.

A shipment of 23,000 pounds ore from the Bismarck, Blackhawk, ran 330 ounces silver, with lead and small percentage of gold.

The new electric power plant of the Georgetown L. & P. Co. of Georgetown is running, and is furnishing power over its 10,000-volt transmission line to the Lamartine, near there. A force will be put on to run it day and night, when it will furnish power to the Griffith and the Mendota also.

Stewart Bros. have bought the Puritan, Idaho Springs, for $20,000. They will put in electric power and push work.

The Puritan mine, near Idaho Springs, is reported sold to Stewart Bros. for $20,000. The Gazette says a tunnel is being run to cut the vein and that electric power to drive the drills will be put in.

Some good ore is coming out of the Mogul and arrangements are being made to put in machinery to sink the shaft to greater depth.

The Oro Verde M. Co. will put in heavier machinery at the Florence, Yankee, and continue driving the tunnel, now in 600 feet.

The Colorado-California S. M. & M. Co., W. H. Knowles manager, will use German system of concentration at the Allen mill, near Idaho Springs.

EL PASO COUNTY.

P. Busch, Supt. Moose mine, Victor, has leased the Ben Harrison, on Bull hill opposite the Moose, and will begin tunneling.

FREMONT COUNTY.

The Dorcas cyanide plant, Florence, capacity 100 tons ore per day, will soon run.

GILPIN COUNTY.

At the Alps mine, near Blackhawk, sinking is being done in the submarine shaft below the 800-foot level.

Harry & Co. have leased the French mine, Quartz hill, and are taking out ore at a depth of 200 feet.

McLeod & Co., at the Kemp–Calhoun mine, near Blackhawk, are drifting east and west at a depth of 230 feet. They are taking out concentrating and smelting ores.

The Gold M. Invest. Co. is widening the bucketway of the West Calhoun mine, Leavenworth gulch.

R. Hughes, lessee of the Lillian Russell gulch, will erect a plant there.

The Gettysburg M., Devel. & M. Co., H. M. Steele manager, reports a strike at the Gettysburg, formerly the Illinois mine, in Lump gulch. They will sink 200 feet and drift.

The Pocahontas shaft, on Quartz hill, Central City, is down 320 feet.

The Rocky Mountain concentration works and 25-stamp mill, Central City, is treating ore from the Minnesota, Russell district, owned by Central Improvement Co., Geo. Collins manager.

The rapid-drop 30-stamp mill of the Tonawanda M., M. & L. Co. is treating ninety tons ore per day from the Perigo, Independent district, Central City. Fifteen men are employed.

The 80 H. P. high pressure boiler for the Sun & Moon, Gilson gulch, Central City, will soon be running.

During September 5634 tons, or 304 cars, smelting ore and concentrates (to Denver) and crude ore (to Idaho Springs) were shipped from Blackhawk.

GUNNISON COUNTY.

The Black Queen, Crystal, is leased to Aspen men. Machinery will be put in and development started.

HUERFANO COUNTY.

The Occidental Development Co., Manager E. W. Redding of Boston, will erect a smelter at Ojo next spring to cost $50,000. The same company, A. A. Foote, Supt., has ten men opening a vein of coal near Ojo.

The Ojo M. & M. Co.'s property at Ojo is sold to Topeka, Kansas, men for $35,000. Name will be retained by new owners and work pushed.

L. Capro of San Fernando M. & M. Co. has men sinking near Ojo.

LAKE COUNTY.

The Rose–Emmet shaft, Arnold Leasing Co., Leadville, present depth 520 feet, will be sunk an additional 100 feet.

The Gordan–Bengal Tiger, Leadville, will be operated this winter.

At the Greenback, Graham Park, Leadville, the new pumping plant will soon be in operation.

The Fortune, on Little Ellen hill, Leadville, Supt. Grimm, employs thirty men and produces about thirty-five tons of ore per day. It is operated by the Fortune G. M. Co., L. C. Ferrel manager.

Work at the R. A. M. shaft of the Small Hopes, Leadville, is resumed. Output from 1100-foot level is 125 tons sulphide per day.

After years of litigation, operations on the Tiger, Leadville, Manager J. McNeece, will resume.

At Resurrection shaft No. 2, Leadville, surface and underground work is progressing.

A streak of lead sulphides, carrying a high percentage of silver, was found in the drift at the Evening Star shaft, Carbonate hill, Leadville.

OURAY COUNTY.

The new smelter at Ouray, F. Ward, Supt., will start up in December.

J. A. Mills, Pres. Blaine M. & E. Co., Toronto, Canada, is at Ridgway, superintending work on the tunnel, which will cut the company's claims. It will be 3000 feet long.

It is locally expected that the Camp Bird deal will go through next month. J. H. Hammond is looked for in Denver Nov. 1, with F. W. Baker.

PITKIN COUNTY.

A. H. Martin of Aspen has a 6-inch streak of galena ore in Lincoln gulch, averaging eighteen ounces silver, 55% lead, besides copper and gold values.

PUEBLO COUNTY.

The Mountain Telegraph Co. is controlled by the officials of the Colorado Fuel & Iron Co. It is capitalized at $1,000,000, and it is the intention of the company to construct a telegraph and telephone service of its own. The lines will connect all the works of the company located in Colorado, New Mexico and Wyoming. In this way the mines as well as the plants will be brought into close connection with the central management.

SAN MIGUEL COUNTY.

The San Juan Gold M. Co., Telluride, will install concentrators. Their new electric drill on the Bessie group is running.

The Smuggler-Union M. Co., Telluride, has acquired Bridal Veil falls, at head of San Miguel river, for power purposes. A fall of 1200 feet will be obtained. Owing to freezing of tailings, the Suffolk cyanide plant at Ophir, after a successful season, has shut down. The capacity will be doubled next spring.

Ore 8 feet wide and carrying copper, iron, gold and silver is reported at a depth of 400 feet at the Daniel Webster mine, near Telluride. Wm. Sullivan, owner.

Adna Lamson has bonded the Jack Hazlett group, near Gladstone.

The Kankakee Gold M. & M. Co. proposes extensive work on its Bear Creek property.

SUMMIT COUNTY.

It is reported that the Ten Mile Leas. & M. Co., of Leadville, will soon begin operations near Robinson.

During a four months' run at the Mecca Co.'s placer, near Breckenridge, 100 pounds gold were cleaned up.

TELLER COUNTY.

A 4-inch streak in the El Paso vein in the Columbia, Cripple Creek Columbia Co., on Beacon hill, Cripple Creek, carries ore running thirty-six ounces per ton. The ore body is a foot and a half in width, and bottom ledge of shoot opened in the crosscut to the southeast, leaving 100 feet of stoping ground, with chances for ore body widening out as raise is run. Main ore body will be followed up and developed.

At the Mabel M., Cripple Creek, Woods Invest. Co., operators, good ore has been found on 355-foot level.

A hoisting plant will be erected on the Arno, Anaconda.

Lessees of Gold Hill portion of the Morning Glory, Cripple Creek, will deepen shaft to 500 feet. Crosscuts will then be run to two fluorine veins. Timbering is done as sinking progresses.

A shipment of twelve cars ore from the Elkton, Cripple Creek, averaged $6000 per car.

T. J. Moynahan has leased the old Finnerty workings of the Mariposa, Cripple Creek, and will begin work thereon.

A new plant is being erected at the Elkton, near Cripple Creek. The old plant will be put on the Hoosier, near there. Air drills will also be put in and the force increased.

Lessee Smith may erect a steam plant on blocks 8 and 9, Olive Branch property, near Cripple Creek.

The new plant at the John A. Logan, Bull hill, near Victor, is running. A new shaft house is to be erected.

Simes & Delaney have leased the Perkins, near Independence. They will put in 6x8 hoist and boiler and will begin stoping on 178-foot level.

A 55-drill compound air compressor will furnish air to the John A. Logan and American Eagle mines on Bull hill. It will be the largest tandem compound compressor in Colorado; steam cylinder 36 inches diameter, high pressure air cylinder 22 inches diameter, low pressure air cylinder 38 inches diameter, all 36-inch stroke, capacity 95 reels.

The Princess Alice Co., Victor, J. S. Fitting Supt., has reopened stoping ground at the 950-foot level.

The Virginia G. M. Co. will sink 400 feet on Lincoln claim; then drift and crosscut.

At the Paris Exposition silver medals have been awarded the Gold Coin, Portland and Independence, Cripple Creek, exhibits.

A whim will be put on the Silver Bell, on the saddle of Globe and Tenderfoot hills, Cripple Creek.

The Tenderfoot Hill Con. Co. has resumed on the Deadwood group, Cripple Creek. The 100-foot shaft will be deepened and lateral work done.

Ore from the Ajax of the Gold Hill Co., Cripple Creek, runs from $20 to $40 per ton.

At the Kimberly (block No. 2), on Beacon hill, Cripple Creek, Brownlee & Milliken are taking $80 ore from the 350 and 400-foot levels.

The Mountain Year, on Carbonate hill, Cripple Creek, is leased to Adams and others of that place. The old shaft, depth 60 feet, is being unwatered.

Work upon the Emma Palmer, Cripple Creek, is in progress.

A shaft house over No. 2 shaft is being erected at the Portland, Cripple Creek.

The Climax Leasing Co. has two shifts sinking at the Climax, Cripple Creek.

The machinery on the St. Patrick, Cripple Creek, St. Patrick G. M. Co. owners, is now running. Wm. Weston is manager. The shaft, present depth 400 feet, will be sunk to the 1000-foot level.

The El Paso Co. is erecting a new gallows-frame at the Orizaba, Cripple Creek.

The Portland G. M. Co., Cripple Creek, is building a reservoir, capacity 26,000,000 gallons, near there.

At Victor 1500 tons ore, value $91,500, were run through the new Rio Grande smelter in four days.

A. B. Jones, lessee of the Jefferson Davis, on Gold hill, Victor, has resumed operations.

The Lucky Gus, Victor, is sold to W. S. Stratton for $100,000.

Ore from the west vein at the Last Dollar, Cripple Creek, runs 100 ounces per ton. It is a white California quartz, sprinkled with free gold.

In ore from the raise being driven from the 215-foot level at the Morning Star, Cripple Creek, besides gold, manganese and sylvanite are found. Much of the values are carried in red talc.

Drifting at the 12th level is progressing at the Lillie, Cripple Creek.

The Easter Bell Co., Cripple Creek, has started drifting on the Easter Bell. The company has already spent $12,000 and may put $18,000 additional into the work.

The Lucky M. & Leas. Co., on Monument and Dillon fractions, near Victor, has erected a 6x8 hoist and has twenty men at work. Machine drills will be put in and crosscutting pushed.

The Granite, near Victor, will resume this month.

The south end of the Monument, Victor, is leased to the Par Value M. & Leas. Co. of Boston, Mass. Machinery will be erected and sinking resumed.

The new plant at the Coriolanus, Victor, will run Nov. 15.

IDAHO.

IDAHO COUNTY.

The Alamance M. Co., organized under laws of California, is incorporated to work near Elk City.

SHOSHONE COUNTY.

Tunneling will be continued at the Springfield, near Wallace.

The Stevens Peak Gold & Cop. M. Co. will continue operations during the winter.

The 20-drill compressor at the Hecla, Burke, is running. Upon completion of hoist, sinking will begin.

The new 50-drill air compressor of the Standard M. Co., Mace, will soon run.

Work at the Champion, and on the Wonderful group, Wallace, will continue during the winter.

The Cœur d'Alene M. Co., Murray, is making its first cleanup of bedrock uncovered by hydraulic elevator; scrapings are taken in wheelbarrows to mouth of elevator sucker and shoveled in, all going through elevator to sluice.

The Great Eastern M. Co., Ltd., Wallace, is incorporated, capital $1,000,000, to work property near there.

MONTANA.

SILVER BOW COUNTY.

The cyanide plant at the Revenue & Monitor, Butte—Roger Knox, general manager—will run soon.

The capacity of the Utah Con. Co.'s smelter, Butte, will be increased to 450 tons per day.

The new steel hoisting works of the Parrot M. Co., Butte, will start running this month.

The Montana Ore Purchasing Co. and the Anaconda Co., Butte, have increased forces at work.

Work on the Smokehouse shaft, Butte, present depth 335 feet, is being pushed.

The shaft of the Mountain View, Butte, is down 1800 feet.

The cyanide plant at the Revenue and Monitor, Butte, Roger Knox manager, will soon run.

Butte figures the daily capacity of Butte & Boston Reduction Works at 600 tons. Of this the Butte & Boston mines supply 350 tons of 3% ore; 250 tons of first and second-class ores are from the Anaconda, Parrot and Colorado mines.

NEVADA.

ELKO COUNTY.

The September yield of the Dexter, near Tuscarora, was $15,000.

ESMERALDA COUNTY.

The Blair estate may soon resume work in the Blair group of mines at Silver Peak. The Golden Eagle, in that district, is reported producing ore going $132 gold.

EUREKA COUNTY.

The Bay State mine, 12 miles east of Eureka, is in the hands of Salt Lake men, who have undertaken its purchase and made the first cash payment. The next payment becomes due March 1, 1901. In the spring the old 20-stamp mill on the property will be remodeled or a new one put in.

STOREY COUNTY.

It is expected that a 20-stamp mill will be built at the mouth of the Sutro tunnel. Water from the C. & C. shaft will be used for driving the machinery.

The entire plant of the Gould & Curry, Virginia City, is now run by electricity, its successful inauguration having been made on the 20th inst.

WASHOE COUNTY.

Ninety tons ore from Olinghouse canyon, near Wadsworth, recently netted $6000.

WHITE PINE COUNTY.

The tunnel at the Robust, Supt. Marx, Ely, is nearing completion. The mill and machinery will soon be ready for operation.

NEW MEXICO.

COLFAX COUNTY.

The Blue Bandana tunnel, near Elizabethtown, is in 720 feet. Wells & Sutton are in 240 feet on their Little Wonder mine.

The contract for 200,000 feet lumber for a new dredger on Moreno river, near Elizabethtown, is let to C. J. Dodd of that place.

DONA ANA COUNTY.

W. K. Shelton of Tularosa has bought the Mocking Bird, in the San Andreas mountains, and will develop same.

M. Allen has leased the Rio Grande and adjoining claims, near Organ, and will work them.

GRANT COUNTY.

The Deming M. & M. Co. is erecting a concentrator at Deming for their own and custom work.

The shaft house at the Philadelphia, Hanover, containing gasoline hoist, air compressor and other machinery, was recently destroyed by fire. F. C. Bell is owner.

SANTA FE COUNTY.

The New Mexico M. & Smelt. Co., Santa Fe, has changed its name to the New Mexico M. & Smelt. Co. of Colorado, to avoid confusion with another corporation of similar title.

SIERRA COUNTY.

Work at the Porter, near Hillsboro, has resumed.

SOCORRO COUNTY.

J. M. Allen, Supt. Grand Ledge M. & M. Co., will put in a 24 H. P. boiler and friction hoist, etc., at the Cavern, near Kelly.

TAOS COUNTY.

The machinery and boiler for the Copper King, Red River, will soon be in place.

OREGON.

BAKER COUNTY.

The Victor M. Co., Sumpter, is organized, capital $75,000, to work property near there.

The additions to the plant of the Columbia, Cracker Creek district, near Sumpter, including twenty stamps, sixteen concentrators, two 5-stamp mortars, etc., will increase output to sixty tons ore per day.

The Little Giant, Baker City, will resume. This will put another 10-stamp mill in operation.

It is reported that another strike has been made in the Bonanza, Baker City, ore running from $600 to $1500 per ton.

The new 10-stamp mill at the Brazos, Baker City, Geiser & Blewett owners, is running.

CLATSOP COUNTY.

The coal deposits near Knappa will be developed by Astoria men.

GRANT COUNTY.

Rountree & Diamond of Portland have leased the Monumental (silver), near Granite, and will begin operations.

JACKSON COUNTY.

Two arrastras are in operation at the Ashland,—Hill, Tucker & Grant owners,—near Ashland.

Ore from the Bill Nye, on Gall's creek, Medford, took first prize at the Industrial Exposition recently held at Spokane, Wash.

UNION COUNTY.

At Cornucopia the Union-Companion is working 150 men and the Cornucopia about 75 men.

SOUTH DAKOTA.

LAWRENCE COUNTY.

(Special Correspondence).—The Homestake Co. is constructing a water line from near Spearfish to Lead, to furnish a water supply for the mines, mills, cyanide plant and for all city and domestic purposes at Lead. The water will be conveyed through 11 miles of 28-inch vitrified stone pipe to reservoirs and pumping station near Lead. Reidler pumps, having 12,000,000 gallons capacity per day, will be supplied with steam from 200 H. P. Scotch marine boilers. The altitude at the intake is about 6000 feet, and the fall along the pipe line will be about 10 feet to the mile. The three Homestake mills have an aggregate of 700 stamps, and 200 more are being added. Concentrators, below the amalgamating plates, have been in use. The cyanidation of the mill tailings is soon to be an important feature of the work. A new plant, strictly modern in construction, is being erected for this purpose and will soon be ready for operating. The main building is 340x100 feet, the precipitating department 65x65 feet, solution storage building 50x100 feet; the brick and steel power house is 50x85 feet. The main structure is frame, but sheathed with asbestos. The solution and sand tanks are 44 feet diameter and 9 feet depth. The solution tank capacity will be equal to 8400 tons; and that tonnage of material will be in course of treatment through the mill. The material will be received and treated in the same tanks—that is, there will be no preliminary treatment. The tailings, however, in traveling from the mills by gravity to the cyanide plant, pass through a system of cone-shaped classifiers, which make a separation of the siliceous sands from the slate slimes. The cyanide work, both as to construction of plant and operating same, is under the supervision of C. W. Merrill, who still retains similar connection with the Drum Lummon mill of the Montana M. Co., at Marysville, Mont. WASCOTT.

Lead City, Oct. 18.

The oldest cyanide plant in the Black Hills, located at Deadwood, has a capacity of seventy-five tons per day.

UTAH.

JUAB COUNTY.

J. A. Beaman of Silver City has leased the old Primrose near there and has commenced development work.

G. Doetsch will erect a whim on the Scranton, near North Tintic.

At the May Day, Eureka, a good strike was recently made in the south drift at the 100-foot level.

SALT LAKE COUNTY.

Bothwell & McConaughty of Salt Lake will erect an ore refinery at that point.

The Chicago & Utah Onyx Co. is incorporated under the laws of Montana, capital stock $300,000, to mine onyx. The company's property is 40 miles from Salt Lake City and 3 miles from Salt Lake lake. The company proposes to build a tramway from the water's edge, from where the stone will be transported across the lake in barges to the Rio Grande Railroad. The company will introduce the Chanler system of quarrying. Up to the present time the onyx has been blasted like common limestone, and only such pieces as were large enough to be cut into fair-sized blocks were saved. The new system will permit blocks of any size to be cut from the ledge.

Work at the Alamo, Bingham, is resumed. The old tunnel, in 300 feet, will be cleaned out and timbered.

It is stated that West Mountain Placer Co., Bingham, will not resume until spring.

W. A. Farish estimates amount ore blocked out in Dalton & Lark mines, Bingham, at 200,000 tons.

At Tintic, the managers of the El Rey and the Sunbeam have made an arrangement by which latter will open up its vein at 1000-foot level through drift from former's shaft. Only 400 feet driving will be required. Pumps at the Sunbeam are running steadily, and water is being reduced to 400-foot level. The Showers Con. M. Co. will put in a concentrator and 4-drill air compressor near Diamond.

Rosa tunnel, Mountain Chief group, Bingham, is in 800 feet.

The crosscut tunnel on the Mystic Shrine, Bingham, will be continued to extreme western edge of property.

Sinking on the Albion, Alta, will be resumed this winter.

SUMMIT COUNTY.

O. Lawrence, at the Jupiter, Park City, is drifting on seams 1500 feet in tunnel.

The tunnel at the Apex, Park City, is being repaired. Work will resume.

Loring Bros. are inclosing the new tramway at the Weber dump, Park City, and will operate during the winter.

TOOELE COUNTY.

Ore from the Queen of Sheba, near Grantsville, shows 66% lead with 60 ounces silver per ton.

WASHINGTON.

FERRY COUNTY.

The Pointer shaft, Republic, is down 530 feet. Drifting is in progress.

Three samples ore from 100-foot level at the Gold Ledge, Republic, gave respective assays of $122, $204.24, $1084.84 per ton.

Supt. M. Downey, of the Tom Thumb, Republic, will sink No. 3 shaft, present depth 285, 100 feet deeper. He will then drift and crosscut.

The Quilp, Republic, is shipping ore to the Granby smelter, Grand Forks, B. C.

J. A. Bangs, owning a controlling interest in the Trade Dollar, Republic, will begin development work thereon soon.

The Flagstaff, Republic, J. Cody Supt., will resume.

The custom chlorination mill of Republic Reduction Co., Republic, will be overhauled and new machinery put in. It is expected that it will be ready Jan. 1, 1901.

It is expected that when the mill at the Republic, Republic, is in full operation 200 men will be at work.

The sampler at the Republic, Republic, is running, crushing twenty-five tons per hour to ½-inch mesh. It is estimated that by running it twelve hours daily it will keep the mill fully supplied.

The Gold Leaf, near Republic, has started preliminary development on a small scale. A 50-foot tunnel will be driven first.

Driving of the crosscut on the Boston & Butte, Republic, Supt. Nickerson, is progressing.

MASON COUNTY.

It is reported that the old Sanger, near Union, is sold to Eastern and Walla Walla men for $100,000, and that they will spend $25,000 in new development work.

OKANOGAN COUNTY.

The Bridgeport M. & M. Co., Supt. Wheeler, proposes to do considerable development during the winter on Mineral Hill, near Conconully.

Mgr. J. M. Hagerty of the Six Eagles M. Co., will put in a gasoline hoist at the Chapaca property. He also projects building a 50-ton mill.

The Golden Zone at Loomis will triple the capacity of its mills.

Mgr. D. G. Chilson at the Utica group, near Loomis, is tunneling on the main vein, and proposes putting in a milll.

SNOHOMISH COUNTY.

The Elwell-Darrington M. Co., Darrington, is incorporated to work the Kickapoo and properties of the Sauk River M. Co., near there. J. G. Givens, upon completion of the railroad to Darrington, will begin shipments.

The air shaft in the lower tunnels of the Mystery and Bride mines, Monte Christo, begun years ago, is completed.

The air shaft in the lower tunnels of the Mystery and the Bride mines of Monte Christo is completed. The new shaft renders the lower sections of the mines accessible. This is locally interpreted to mean an increased payroll of from $15,000 to $30,000 per month and the running of trains into Monte Cristo.

WYOMING.

CARBON COUNTY.

The Ferris-Haggerty Copper M. Co., Osceola, is building a telephone line to Rawlins via Battle Lake and Saratoga.

LARAMIE COUNTY.

Shipments from Hartville iron mines, Hartville, average 330 carloads per day. With the advent of increased rail facilities, now under construction, the output will be much larger.

FOREIGN.

BRITISH COLUMBIA.

Wages for mine workers in Kootenay are as follows: Men working in shafts, $4; machine men, $3.50; hammersmen, $3.25; carmen, muckers and laborers, $3. This is known as Slocan compromise scale, and is paid by every mine working in Slocan, Ainsworth, Nelson, Moyie, Boundary and Lardo districts. In the two last-named districts hammersmen get $3.50 a day. The management of the Ymir, Nelson district, have posted notices that the standard scale will be paid in future.

The Fletcher group at Whitewater is sold to an English company, C. Plowman manager; consideration, $30,000 cash.

The Rossland Bonanza G. M. & M. Co., S. W. Hall managing director, will resume on Bonanza No. 3, on St. Thomas mountain, Trail Creek division, near Gladstone.

Construction on aerial tramway from the Le Roi hoist to the Black Bear flats has begun. The Le Roi sampling mill will be finished next month.

The Venus G. M. Co. of Toronto will place a 10-stamp mill on the Venus, Morning mountain, near Nelson.

A compressor will be put in at Mansfield Camp, Kaslo, E. Mansfield, manager, in course of next two months. Tunneling will then be pushed.

The tram at the Ivanhoe, Sandon, is completed.

P. Johnson of Greenwood, manager smelter department of the British Columbia C. Co., Ltd., which will in December open its smelter at Greenwood, has offered the management of the Winnipeg mine in Wellington camp a freight and treatment rate of $4 per ton, to go into effect on December 1st. This makes $8 ore profitable. The Winnipeg has been paying a $5.50 rate to the Granby smelter at Grand Forks.

The Sunset Hydraulic M. Co., Atlin district, has closed down for the season, upon orders received from the Gold Commissioner, issued on account of complaints from numerous claim owners that tailings from the monitors were interfering with their washings. The balance of this season will be allowed the creek claimants to work out their 100 feet claims, and the hydraulic companies should have an open field next year.

The Mother Lode smelter, at Greenwood, Paul Johnson Supt., is nearing completion.

Amount of ore blocked out at the Old Ironsides, near Grand Forks, is estimated at 1,500,000 tons.

Shipments to Grand Forks smelter average 300 tons daily. It is expected that the output will be doubled during next month.

A 10-stamp mill will be erected on the Referendum, on Forty-nine creek, Nelson. Operations will resume.

A small plant will be erected on the Strawberry, Brown's Camp, Grand Forks.

Work on the Volcanic, Grand Forks, R. A. Brown manager, will resume. A 7-drill compressor will be put in.

The force at the Athelstan, Wellington Camp, Grand Forks, is now twenty-two men.

It is announced that ore will be quarried from the surface of the Knob Hill, Grand Forks, next spring.

An assessment of 10 cents per share has been levied on Iron Mask stock, to cover expenses of litigation with Center Star Co. Operations will be resumed.

Work on the Spitzee, Rossland, Alex. Sharp Supt., is resumed.

The Velvet M. Co., Ltd., J. L. Morrish manager, will install a sawmill, 15-drill compound air compressor, pumps, winding engines, etc., at the Velvet, Rossland.

The Rossland Great Western M. Co., Rossland, will put in a 40-drill electrical compressor at the Rossland G. W.

INDIA.

Bids have been asked of several electrical engineering firms for equipping an extensive electric power supply plant in the Mysore gold mining district. Current is to be generated at the Convery Falls and conveyed 100 miles to the gold mines. The Mysore Government is to defray the cost of the installation.

LOWER CALIFORNIA.

Supt. F. E. Russell, Aurora mine, Alamo district, says that the Aurora, Bracho, Ulysses, Montezuma and San Jacinto mines have their machinery in place, and most of them are in operation. The Aurora is shut down owing to a change of management.

At the Visnago, owned by Hartsell & Davis, 3 miles from Alamo, a 10-stamp mill is being erected. The cyanide plant there is in operation.

MEXICO.

Final action in the protracted litigation over the Weil and La Abra mining claims against the Mexican Government in the U. S. Supreme Court dismisses the appeal of Alice Weil from the judgment of the Court of Claims on the ground of non-prosecution. In view of the adverse decision in the La Abra case, the appeal was not prosecuted. The balance of the indemnity paid by the Mexican Government, amounting to some $200,000, will probably be refunded.

L. Davis has leased the Cinco de May, in the Escondido mountains, Chihuahua. Men are at work and shipments will soon begin.

SOUTH AFRICA.

The Rand mining companies are reported disappointed by the delay in ending the military campaign. They sent engineers and agents to Cape Town when Pretoria was occupied, where they have remained in idleness month after month. Engineers representing large mining interests have been allowed to go to Johannesburg and report on the condition of the plants, but pumping operations have not been resumed, and miners and natives cannot be employed until the railways are prepared to carry coal and supplies on a large scale. The railways barely suffice for the needs of the army, and it is not believed that the mines can be operated with efficiency before the end of six months.

Cape Town cables: "All eyes are turned yearningly to the Transvaal. The return of refugees to Johannesburg has now begun at the rate of a thousand arrivals per week. Nevertheless, there appears to be little chance of any active resumption of the mint output before the beginning of 1901, nor does the prospect of an early return of normal conditions in the Transvaal just now look encouraging."

Personal.

A. G. KEILLER of Dundee, Scotland, is in Denver.

C. TABOR, of the Red Boy, Baker City, Or., has returned from Portland, Or.

A. H. TARBET of Salt Lake, Utah, has returned from Nevada and California.

WM. DAVIES has resigned the foremanship at the Ray mine, Kelvin, Arizona.

MANAGING DIRECTOR HOLDEN, U. S. M. Co., Bingham, has returned from the East.

F. F. GRIMES, Supt. Diadem, Robinsonville Camp, Or., has returned from Butte, Mont.

JNO. TRUSCOTT has resigned the superintendency of the Oneida, Sutter Creek, Cal., mine.

F. W. SAMUELSON, of Humboldt, Neb., Pres. Golden Edge M. Co., is in Breckenridge, Colo.

F. D. FRENCH has been appointed general manager Rio Grande Sampling Works of Victor, Colo.

LOUIS JANIN, JR., has taken the superintendency of the Dorcas M. M. & D. Co. at Florence, Colo.

F. T. FREELAND of Aspen, Colo., who has been in Europe several months, will return home this week.

HAROLD BOEDTKER, late of San Diego, Cal., is now assayer and chemist for Verde Queen Co., Jerome, Ariz.

CHAS. H. DUELL, Commissioner of Patents, is about to resign to engage in law practice in Syracuse, N. Y.

EDWIN HAWLEY has declined the presidency of the Southern Pacific Co., at a salary of $40,000 per annum.

G. E. BAILEY, PH. D., late of Lewiston, Cal., has established engineering headquarters at 117 Sutter street, San Francisco.

H. C. BUSH, general agent Colorado Midland railroad in San Francisco, has been appointed general traffic manager of that road.

HENNEN JENNINGS of London, Eng., and F. W. Bradley of California and Idaho have been examining mining properties in Utah.

W. W. MEIN of Oakland, Cal., a son of the late Capt. Thos. Mein, goes to South Africa as assistant mine manger at an annual salary of $7000.

J. H. THOMAS of Oakland, Cal., W. W. Treat of Boston, owners the Mammoth Springs mine near Forest City, Cal., are visiting that property.

T. A. RICKARD, consulting engineer of the Venture corporation of London and State Geologist of Colorado, will arrive in Denver from Europe this week.

T. H. LEGGETT, former manager Standard Con. M. Co., Bodie, Cal., is in New York City and contemplates returning to Johannesburg, S. A., about Jan. 1, 1901.

S. BOWERS, stated by the San Diego Union to be "California's State Geologist, in the field, by appointment of Governor Gage," is in Yuma, Arizona, examining oil indications there.

Books Received.

"Free Hand Perspective," V. T. Wilson, for use in manual training schools and colleges, 8vo, 268 pages, cloth, $2.50. The entire subject is treated from a standpoint entirely different from the one formerly adopted, being more after the plan of model drawing, the idea being to apply the principles of linear perspective to free-hand drawing, an effort in which the author has achieved some measure of success; published by Jno. Wiley & Co., New York City.

"Famous Gold Nuggets of the World" is the title of an interesting little book on that subject by T. J. Hurley of New York City, in which he gives full credit to the sources of his information and presents a mass of data on a subject that must long continue of interest to many.

Catalogues Received.

Catalogue No. 3, fifth edition, "Hydraulic Mining Machinery," issued by the Joshua Hendy Machine Works, 38-44 Fremont St., San Francisco, illustrates and fully describes that firm's specialties in hydraulic mining appliances. There are many new illustrations, and every device described is well portrayed by sectional drawings. Valuable tables are also given, and the entire contents are copyrighted. A copy will be sent any of our readers on application.

"Hoisting Machinery" is the subject of the latest trade treatise, No. 42, issued by the M. C. Bullock Mfg. Co. of Chicago. The name of this company is indissolubly connected with the diamond drill, but that is not the only mining device furnished at 1170 West Lake street, as the indigo-covered pamphlet received shows. There are some good views and excellent descriptions of direct-acting and geared reel hoists with tables of rope and drum capacities. The pamphlet will be sent upon application.

The thirtieth edition of the Keuffel & Esser Co.'s catalogue is of interest to any one using drawing materials, mathematical or surveying instruments. The catalogue has nearly 500 pages—over fifty more than the preceding edition. The changes from the last edition are mostly additions. The descriptive matter has been elaborated and made more complete, and many cuts have been replaced by better ones or added. The index has been carefully revised. Of the several additions may be mentioned slide rules, new planimeters and pantographs, which are now listed in a heretofore unattempted variety and in a greatly improved assortment. Fine narrow steel tapes are listed in an increased assortment, and the reels are listed separately to allow of greater latitude in selecting. Current meters, hook gauges, tide gauges, aneroids, barographs, thermographs and hydrographs have been added, and of sextants and octants there is a new list. The assortment of drawing instruments, scales, drawing tables, etc., has been increased. Profile and cross-section rulings on cloth have been added. The catalogue will be sent upon request. The New York office is 127 Fulton St.; Chicago, 111 Madison St.; St. Louis, 708 Locust St.

Commercial Paragraphs.

JOHN T. ELKINS, nephew of S. B. Elkins of West Virginia, and son of the late John T. Elkins of Leadville, has opened an assay office and laboratory at 1736 Champa St., Denver, Colo., having purchased the equipment and business of Draper & McLeod.

E. G. DENNISTON, proprietor Denniston's San Francisco Plating Works, says: "We have moved our plating establishment from No. 652 Mission street, San Francisco, to our new and commodious place, No. 743 Mission street, between Third and Fourth, one block above on the opposite side of the street. We now have the largest and most complete plating works on the Pacific coast, and with our improved and extensive facilities will be enabled to fill orders for silver-plated copper mining plates, and the plating of every description of metal goods with gold, silver, nickel, brass, etc., with promptness and at greatly reduced rates. Our works have been in successful operation here for the last thirty-five years, and we will use our best efforts to please our customers and maintain our reputation for first-class work." A business establishment that has been in continuous and successful operation for thirty-five years has certainly just claims to the favorable consideration of customers everywhere.

Recently Declared Mining Dividends.

	Payable.
Buffalo Hump M. Co., Idaho, 1%	Nov. 1
Drummers' Dev. Co., Washington, ½ cent per share	Nov. 1
Mammoth M. Co., Utah, 5 cents per share, $20,000	Nov. 1
Utah M. Co., Utah, 2 cents per share, $2000	Oct. 25
Vindicator Con. M. Co., B. C., 1½ cents per share, $27,500	Oct. 25

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING OCT. 16, 1900.

659,949.—PACKING FRUIT—C. W. Arrasmith, Courtland, Cal.
659,804.—CAN HEADING MACHINE—E. C. Atwood, S. F.
659,645.—PIPE BOILER—C. D. Casad, Seattle, Wash.
659,810.—MECHANICAL MOVEMENT—E. Cherry, Santa Rosa, Cal.
660,049.—SUPPORT—C. E. Cook, Whittier, Cal.
659,794.—HYDRAULIC NOZZLE—W. A. Doble, S. F.
659,795.—GAS APPARATUS—McD. Elliott, Santa Rosa, Cal.
659,918.—MOP HEAD—J. R. Froberg, Grass Valley, Cal.
659,796.—MAIL POUCH—Gavin & Griffin, Eureka, Nev.
659,745.—CONVEYOR FOR ROPEWAYS—A. S. Hallidie, S. F.
659,748.—CULTIVATOR—R. L. Hill, Saticoy, Cal.
659,923.—WEIGHING MACHINE—G. Hoepner, S. F.
660,015.—SAWBUCK—T. J. Johnson, Harrington, Wash.
659,798.—SPRING CONNECTION FOR VEHICLES—P. L. Jones, S. F.
659,977.—OIL CAN—A. Kitterman, Portland, Or.
660,017.—ROTARY ENGINE—W. Lambert, Los Angeles, Cal.
659,684.—RUBBER DAM HOLDER—J. A. W. Lundborg, S. F.
659,932.—GOPHER TRAP—Z. A. Macabee, Los Gatos, Cal.
660,061.—LATCH AND LOCK—J. B. E. Macnamara, S. F.
660,062.—HAT—T. L. Mahoney, S. F.
660,077.—WEIGHING MACHINE—J. Manes, S. F.
659,934.—STAMP BATTERY MORTAR—W. A. Merralls, S. F.
659,753.—DRAG SAW—W. A. Miller, Wapinitia, Or.
659,987.—CARBURETOR—H. C. Ray, Visalia, Cal.
659,801.—ALMOND HULLER—W. G. Read, Colusa, Cal.
659,901.—WATER MOTOR—J. Sands, Seattle, Wash.
659,708.—PLANER—G. W. Stetson, Seattle, Wash.
660,035.—WAVE MOTOR—G. N. Todd, Los Angeles, Cal.
660,036.—WAVE MOTOR—G. N. Todd, Los Angeles, Cal.
33,400.—DESIGN—Rova E. Alexander, Garfield, Wash.
33,391.—DESIGN—C. H. De Voll, Seattle, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CHECK HOOK.—No. 659,611. Oct. 9, 1900. F. G. Snook, Sacramento, Cal. This invention relates to a new and improved harness check hook or device for holding check reins in position. It comprises a post having at its upper portion a transverse slot or opening with a notch forming a depressed sheet, a continuation of the upper wall thereof and a ring or loop pivotally mounted to the base of the post and composed of spring material, said ring or loop adapted to be passed into the slot, and thus prevent the check rein which is fitted on the post from slipping off. The rein is easily released by disengaging the ring and turning it backward, leaving the upper part of the post clear for the release of the check rein.

TRACK CLEANER AND OILING DEVICE.—No. 659,408. Oct. 9, 1900. Wm. Morck, Peter Krickau and Wm. Boehle, Oakland, Cal. This invention relates to devices for clearing the tracks of railway cars from obstructions, and a means for making the connection between the clearing device which is carried upon the swiveling truck and the car body which is movable transversely independent of the truck. The invention consists of brushes having shanks slidable in vertical guides on the truck, a transverse bar connecting the shanks of opposite brushes, a second transverse bar carried by the car body, and a loose connection and guide between this bar and the first named one, with means whereby the second bar may be raised and lowered so as to raise and lower the first named bar and its brushes.

SPRING CONNECTION FOR VEHICLES.—No. 659,798. Oct. 16, 1900. P. L. Jones, San Francisco, Cal. The object of this invention is to connect the contiguous ends of side and end springs which are used conjointly upon buggies, carriages and like vehicles. It consists in cutting away an intermediate portion upon each side of the leaf near the end, leaving the extreme end of full width, then folding and welding the cutaway portion upon itself, with the end part overlapping and welding upon the end of the spring and rounding the folded smaller portion to form a cylindrical spindle. The second spring meets the first at right angles, and has the end bent into a cylindrical form. A rubber bushing fits within said end abuts within the collar of the first named spring. A metal sleeve is centrally fitted on said bushing and turns upon the spindle of the first named spring, and a nut and collar fitting upon the end of the spring abut against the outer end of the elastic bushing. This forms a tight and noiseless joint with sufficient yielding to allow the change in position which takes place during movements of the springs.

MAIL POUCH CLOSURE AND FASTENING.—No. 659,796. Oct. 16, 1900. Geo. Gavin of Eureka, and W. E. Griffin of Reno, Nevada, assigned to the Safety Mail Pouch Fastener Co. of Eureka, Nev. The object of this invention is to provide a novel and improved closure and fastener for the mouths of mail pouches. It consists in the application of front and rear slotted plates, centrally located similar plates fixed to the outer edges of the pouch, and a central plate secured to the front of the pouch below the previously named plates, and having a staple fixed to and projecting outwardly from it over which staple all the other plates are folded to overlap, so that the single lock or fastening through the projecting staple secures the mouth of the pouch. These plates thus form a rigid border for the closing edges, which prevent any access to the interior and a single fastening is sufficient to hold the parts together.

CONVEYORS FOR ROPEWAYS.—No. 659,745. Oct. 16, 1900. A. S. Hallidie, San Francisco, Cal. This invention relates to conveying attachments to be used for aerial wire ropeways or tramways, and is especially designed for the transportation of sugar cane and other material that can be made up into bundles or packages. It consists essentially of slings in which the packages or bundles are contained with a pole or rod from which the slings are suspended. This pole or rod is placed upon carriers suspended from the rope way, and thus the bundle is transported to the point where it is to be delivered. The delivery is effected by an automatically unlatching device which disengages the pole from the arm, and allows the bundle to drop at the point of delivery.

CAN HEADING MACHINE.—No. 659,804. Oct. 16, 1900. E. C. Atwood, Golden Gate, Cal., assignor to Pacific Coast Syrup Co. of San Francisco, Cal. The object of this invention is to provide a device for heading cans of that class in which the body is made of pasteboard or like material with metallic or other bottom, and metallic or other head, and it is designed to apply and crimp a metallic ring by which the head is secured upon the top of a can after the latter has been filled. It comprises a frame having upper and lower guides, vertical shafts mounted in said guides, one of said shafts having a spring seated table to support the can, and the other shaft having an encircling sleeve provided with a disk to rest upon the can head. A collar is splined upon the sleeve and a treadle and connections are employed for raising and lowering the shaft. Fulcrumed arms project from the disk and the collar, and other arms are fulcrumed between their ends to the arms on the disk and have their lower ends provided with semi-globular beaded heads which travel in contact with the cover, and form an indented ring which secures it to the body of the can. Links have one end connected with the arms on the collar, and their opposite ends pivotally connected with the upper ends of the arms which carry the beaded head. A lever is connected with the collar and the treadle and connection serve to operate the same, so that the beaded heads may be moved into and out of contact with the securing rings. The device is then rotated by suitable gearing, and the beaded heads are caused to travel around in contact with the cover until the latter is properly interlocked and secured upon the can body.

AUTOMATIC WEIGHING MACHINE.—No. 659,923. Oct. 16, 1900. Geo. Hoepner, San Francisco, Cal., assignor to the Union Scale & Manufacturing Co., of Sacramento, Cal. This invention relates to machines of that class which are designed to weigh powdered, granular or similar substances, and to deliver such substances in regular quantities into such receptacles as may be desired. It consists of a weighing receptacle, means for supplying the material to be weighed thereto, a fulcrumed scale beam with adjustable weights, from one end of which beam the receptacle is suspended, a plurality of chambers within the receptacle, a tilting partition, and mechanism by which this partition is alternately moved from one side to the other so that the material arriving from the source of supply will first fill the chamber upon one side of the partition until given weight has been reached, and will then be transferred to the other side, thus alternating without interruption. In combination with this is a mechanism by which an even feed is maintained, mechanism by which the parts are mechanically actutaed and locked intermediate of their movements so as to gold the tilting partition in position, and the hinged movable bottom of the receptacles so that the bottom of the one which is being filled will be closed while the other is opened for discharge. The position of these bottoms are reversed with the reversal of the partition which guides the material into each compartment.

RECEPTACLE FOR PACKING FRUIT.—No. 659,949. Oct. 16, 1900. C. W. Arrasmith, Courtland, Cal. This invention is designed to provide a means for packing fresh fruit rapidly into baskets, or similar receptacles, and to provide for a suitable convexity or crown to the surface of the fruit. It consists of a baseboard having a concaved depression and means for supporting the basket inverted over this depression. The bottom of the basket being opened, fruit is filled into it from the bottom, and when full a flexible covering or bottom is placed upon it and pasted or otherwise sealed upon the sides of the basket which is then inverted so as to be right side up when removed. The basket is held in place by spring-pressed arms which retain it while being filled, and which are disengaged to allow the basket to be released. When the basket is removed the baseboard and the basket are turned together so that the latter is in its proper upright position.

Latest Market Reports.

SAN FRANCISCO, Oct. 25, 1900.

SILVER—Per oz., Troy: London, 30¼d (standard ounce, 925 fine); New York, bar silver, 65⅛c (1000 fine); San Francisco, 65⅛c; Mexican dollars, 51¼c.

The combination of Indian and Chinese demands makes it likely that the improvement in the market for silver may continue, as there is prospect of further purchases of bar silver in the London market or elsewhere for the Indian Government, to be used in the coinage of rupees. Good crops in India and large exports during the ensuing year may give that country a favorable balance of trade, which would have to be settled in silver. Conditions of this character, moreover, would naturally create a demand for additional silver money for circulation in India, and it is therefore thought that the Indian purchases of silver during the next twelve months are likely to be larger than in any corresponding period since the closing of the mints of that country to the free coinage of silver. With favorable internal conditions India seems, in fact, likely to require and to buy as much silver each year as it did prior to the suspension of free coinage, and such demand, if kept up and not accompanied by considerable increase in the current supply of silver, would probably lead to higher average prices for silver than have prevailed since 1893.

The demand for Mexican silver pesos in the East is increasing, says Director of the Mint Leandro Fernandez, but the production of silver in that country is not commensurate with the increasing demand. He has heard nothing of the proposed abolition of the mint dues to induce producers to keep silver there. The measure, he declares, is not likely to be pushed at present. The smelters are shipping a large portion of their output to the United States, even paying the 5% export tax, thereby saving the charges for coinage established under the Mexican law of 1897. This law levies a coinage duty of 2% and a stamp duty of 3%. The pending elections in the United States have affected foreign exchange in Mexico. Four years ago gold exchange fell to 180. Last April the exchange reached 210. It is now 198, with a tendency to reach a rate lower than that prevailing in the fall of 1896. The production of silver in Mexico is hampered by local conditions, such as lack of water at Pachuaca and Zacatecas, and is not likely to increase materially unless an appreciation in the value of silver can make possible the working of low-grade ores from Chihuahua and elsewhere.

COPPER.—New York: Lake, 1 to 3 casks, $16.87½ cash; carload lots, 16.50; Electrolytic, 1 to 3 casks, 16.75; carload lots, 16.37½; Casting, 1 to 3 casks, 16.50; carload lots, 16.25. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.37½; Salt Lake City, $4.20; St. Louis, $4.27½; San Francisco $5.00, carload lots; 5¾c 1000 to 4000 lbs.; pipe 6¾, sheet 7¼, bar 6c; pig, $4.70 @5.10. London, £17 2s 6d=3.83½c per ℔.

SITUATIONS WANTED.

WANTED.—POSITION AS ASSAYER AT cyanide plant or mine. Have had considerable experience and hold good references. Address "B," care of Wade & Wade, 115½ N. Main St., Los Angeles, Cal.

SITUATION WANTED BY MILLMAN. Have had 20 years of practical experience. Understands thoroughly pan or battery amalgamation, concentration, belts and machinery. Able to take charge of a mill or any job in a mill anywhere. Best of recommendations. Address Box 4, Virginia City, Nevada.

GRADUATE MINING ENGINEER, five years field work, surface and underground, familiar with cyaniding, surveying and draughting, desires position after Nov. 1st as Assayer and Chemist or Ass't Supt. A1 references as to ability and character. Salary small object; opportunity to prove ability considered more important. Address B. F., care this office.

MINING ENGINEER (technical training), twenty years' experience as surveyor, assayer, superintendent and manager of mines and mills; business qualifications; linguist; at present general manager mining and milling proposition in Mexico; desires to make a change on account of health; best references. Address S. O., Mining and Scientific Press.

Quicksilver

For Sale in Lots to Suit.

REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

Quicksilver

—FOR SALE BY—

The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - - 320 SANSOME STREET,
SAN FRANCISCO.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

A. M. DONALDSON & CO.,
ASSAYERS AND WASTE PRODUCT SMELTERS,

Donaldson's Assayers' Slag Hammer { 1 lb.....$1.10 / 1 lb. 3 oz. $1.25 }

MILL PLANS.
Cyanide, Concentration, Smelting, Sampling.
F. D. BAKER, Mech. Eng., DENVER.

WANTED.

CHROME IRON ORE WANTED.

State price and quantities that can be furnished. Send samples and all information to W. C. CO., 3214 Twenty-fifth St., San Francisco, Cal.

WANTED—A VERY LARGE PRODUCING gold or copper mine—at least two millions. Must be presented in A1 shape; title absolute; ample time required for examination. Address S. M. B., Mining and Scientific Press.

INFORMATION WANTED

regarding whereabouts of John R. Williams, about 70 years old. Last heard of as Supt. of a mine in Copper's Hill, Vermont, in 1866. Has an adopted son about 32 years old. Supposed to be placer mining in the West, possibly California. $25.00 reward at Deseret News Office, Salt Lake City, Utah.

WANTED.

Experienced Promoter and Stock Operators

to handle the sale of stock for an oil company. State previous experience.

For particulars, address

C. J. TALLON,
308 Market Street,........San Francisco, Cal.

REFRACTORY ORES WANTED.

1000 TONS or more which will assay $75.00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.

C. J. TALLON,
308 MARKET STREET, SAN FRANCISCO, CAL.

SPIRAL SAND PUMPS.

For Pumping Sand, Slimes, Tailings and Crushed Ores.

The Cheapest and Most Durable Pump on the Market. Manufactured by J. H. Frenier & Son.

Represented by M. S. HAUSER,
12 Front Street,............San Francisco, Cal.

BENJAMIN T. LLOYD,
STOCKS, BONDS AND MINES.

Have immediate customers for well-developed Gold and Copper Properties.

P. O. Box 608, **SALT LAKE CITY, UTAH.**

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,
544A MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

FOR SALE.

Two Second-Hand PUNCHING MACHINES,
SUITABLE FOR PIPE MAKING.

FRANCIS SMITH & CO., 46 Fremont St., San Francisco, Cal.

For Sale or Bond---Very High Grade Copper Property Located in Arizona.

JOHN M. VRCHOTA, La Crosse, Wis.

FOR SALE.

A high grade Gold Mine of free milling ore near Grass Valley, Cal. Ore runs from $10 to $30 per ton. It is well developed but not equipped. U S. Patent covers 3000 feet of ledge. Is surrounded on all sides by large dividend-paying mines. A rare bargain offered. Apply to E. J. FRASER, agent for owners, No. 522 Parrott Building, San Francisco, Cal.

FOR SALE.

A JACOBS CONCENTRATOR, been used about four months.

Also a fine O. & S. ENGINE, 25 H. P.

25 H. P. BOILER, used about six months, in good order and condition

Also a 40 H. P. ENGINE, now running and can be seen in motion.

Address E. D. BAKER, YREKA, CAL.

Hoist on Hand for Immediate Shipment.

A first-class Steam Hoist, double 10x12 cylinders, drums 48″ dia. by 30″. For specifications, price, etc., address Mining and Scientific Press.

FOR SALE.

Hydraulic Pump and Press.

Watson & Stillman Pump and Caking Press. Nearly new.

THE S. H. SUPPLY CO.
WRITE FOR CATALOGUE OF MINING MACHINERY AND SUPPLIES.
22nd and Larimer Sts., DENVER, COLO.

FOR SALE,

Lease or Bond, 6 Months' Time.

80,000 acres of timber lands at La Tesca Municipality, Ahuacatlan, Tepic, with mineral deposits—gold, silver, zinc and lead. Water power close to the mines. Address to

ELIAS GALINDO, Box 26, Tepic, Mexico.

A group of 12 Colorado high-grade gold mines are now offered for sale for the first time. Wide veins of rich, free-milling ore. Plenty of wood and water. Good roads, and near R. R. station. Title U. S. Patents. Capitalists or their special agents only need apply. Buyer and seller brought together for negotiations. Address E. J. FRASER (sole agent for owners), Room 522, Parrott Building, S. F., Cal.

FOR SALE.

Lease and Bond, Eighteen Months, Easy Terms, Copper Property, New Mexico.

High grade ore with good gold values. Accessible. Plenty wood and water. Strong vein. Three shafts. Will pay from start. Adjoins large producing mine. **H. E. RUNKLE, El Paso, Texas**

FOR SALE.

One 10″x12″ Double Cylinder, Double Drum Mine Hoist.

One 14″x30″ Duplex Air Compressor, Corliss Steam ends.

Two 54″x16′ Return Tubular Boilers.

One No. 6 Llewellyn Feed Water Heater.

One 36″x9′ Air Receiver.

One Duplex Boiler Feed Pump.

All in good working order and nearly new. Also Rock Drills, Sinking and Station Pumps, Air Pipe, Ore Cars, Skips, Wire Rope, Blacksmith and Carpenter Tools. A bargain for anyone wanting an up-to-date mine equipment. Address Box 376, this office.

THE CALIFORNIA DEBRIS COMMISSION, HAVING received applications to mine by the hydraulic process from the Cataract and Wide West Gravel Mining Co., in the Wide West Gravel Mine, near Eho. Calaveras Co., to deposit tailings in North Outlet and Prospect Gulch; from H. Sleighter and Thomas Harper, in the San Francisco Mine near Todd, Placer Co., to deposit tailings in Dardanelles Canyon; from Chas. S. Deisem, in the Riffle Point Mine, at Grass Flat, Sierra Co., to deposit tailings in Grass Flat Ravine; from Geo. Fitzgerald, in the Lone Star Mine, near Cromberg, Plumas Co, to deposit tailings in Jackson Creek; from G A. and F. W. Bruckerman, in the Renaissance Mine, near Howland Flat, Sierra Co., to deposit tailings in a worked-out pit; from J. R. Bell and A. B Jacks, in the Badger Hill Mine, near Spanish Ranch, Plumas Co., to deposit tailings in Whitlock Ravine; from W. T. Sherman and O. F. Caya, in the Last Chance Mine, near Port Wine, Sierra Co., to deposit tailings in French Ravine; from C. N. Kingsbury, in the Conger Gulch Gravel Mine, near Igo, Shasta Co., to deposit tailings in Dry Creek; from John McGrath, in the Independent Mine, near St Louis, Sierra Co., to deposit tailings in Sears Ravine; and from J. F. Cowdery, in the Chandlerville Mine, near St. Louis, Sierra Co, to deposit tailings in Sackets Gulch, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on November 12, 1900, at 1:30 P. M.

THE increase in the business of manufacturing electrical appliances in this country is illustrated by the growth of the export trade. During the first eight months of 1898 the United States exported electrical machinery to the value of $1,439,743; during the corresponding period of 1899, $1,828,048; and during the first eight months of the present year the exports have increased in value to an aggregate of $3,590,419.

AT a recent meeting of the Southwest Miners' Association at Los Angeles, Cal., resolutions were adopted setting forth the value to the mining industry of the topographic, geological and hydrographic work of the U. S. Geological Survey, the small amount of the annual funds available therefor, the consequent need of larger federal appropriation, and urging that the States and Territories interested make effort through their officials and Congressmen to secure larger federal allotments for such purpose.

IT is to the advertisers in this paper that its efficiency is largely due. Were it not for their patronage this paper could not be weekly furnished as it is for less than 6 cents per number. It is, of course, because of the thousands of probable customers among our readers throughout the west half of America that so many firms have their business announcements in our advertising columns, and it is because of both facts cited that suggestion is made that whenever our readers make purchases they buy of those whose advertisements they see herein.

GOLD is constant at $20.67 per ounce, but other metals are appreciating in value. Silver is steadily appreciating, and may close the year at a figure higher than it has been since 1896. Copper in that year was worth but 10 cents and lead 2¾ cents. The present prices make a silver-lead-copper ore of greater value than at any time since 1893. It is a noticeable fact that when silver goes up, ordinarily lead and copper drop, and when silver goes down the two base metals appreciate in value. The copper production of the country is in a particularly prosperous condition. The copper product for the first ten months of the year aggregated 4,950,000,000 pounds, valued at about $80,000,000; figuring 8 cents per pound for all expenses, would leave a profit or net earning so far this year of $40,000,000. The Calumet & Hecla of Michigan pays 8.1 cents per pound produced profit; the Boston & Montana of Montana, 9 cents; the Quincy M. Co. of Michigan, about 6.7 cents per pound.

A Proud Record.

The California Miners' Association will hold its ninth annual session on the 19th inst. It is an organization that has done a great deal of good, has been of inestimable value to California's mining industry, and is not generally credited with its deserts. If it does not receive the praise it deserves it might at least be spared some of the unfair criticism bestowed upon it. It is not pleasant to those acquainted with the facts to read in a Shasta county paper that the California Miners' Association is too busy taking care of the hydraulic miners' interests to give any attention to northern California; to read in a Placer county paper that the California Miners' Association neglects the hydraulic miners and devotes too much attention to other sections; to read in a San Francisco paper that politics enters into its purposes, or to read in a Los Angeles paper that southern California is not in its purview. Probably the State is too big; perhaps each mining district or even each mine would do better to have a little association of its own. But, as Fred Zeitler of Nevada county said at the last convention, "in union is strength," and the remark is quoted because it can not be improved. The California Miners' Association has been extraordinarily fortunate in having been able since its organization to command the splendid services of men who freely gave their time and experience to the common good, bestowing effort that, like many of the best things of life, could not be paid for in money. Were all the service so freely devoted to the association charged for, it would have bankrupted any treasury. As it was and as it is, anyone serving the association has been proud to place such service at the call of the committees, and thus, so far as in him lay, to advance and aid the cause of the California miner. It is but due to those men that this be said, and it is but the simple truth that is here stated.

It is unique in the history of mining in any State that for nine years men in every walk of life, unawed by influence and unbribed by gain, men the value of whose hours are counted in dollars, should have given gratuitously of their time and effort in successful advancement of the mining industry, no officer or member drawing a dollar in salary.

If it be deemed advisable to descend from so high a plane; if it be considered of greater good to split up and stray into little sectional coteries; if such secession conduce to greater value to the mining industry of the State, then perhaps it were well to give such idea consideration. But if the same spirit shall prevail that pervades and animates such organizations everywhere, the spirit of union and solidarity, then it were well not to be too hasty in condemning a result not wholly understood, and to stand by the only organization of the kind that has been run with such singleness of aim, such loftiness of purpose and such successful result to the general mining prosperity of the commonwealth.

"WHY is not more said about revision of mining laws and a department of mines and mining in your columns?" asks a Utah subscriber. There are several reasons why; the principal one is that no public journal can afford to keep talking of one thing continuously. This paper originated the ideas, advocated them, got them indorsed, and so did its duty in advancing the interests of the industry it represents, but it is neither our province nor our purpose to weary our readers with any subject, however important it may be. Besides, it argues a poverty of mental resources to be always talking about the same thing; there are other topics of equal present importance to be discussed. Then, too, this paper has no special personal interests to serve. Meanwhile, whenever the American miner makes up his mind he needs those things he will have them. It would be worth $100,000,000 annually to the mining men of this nation to have proper revision of the mining laws and a department of mines and mining, with a cabinet officer. The need for both of these things is even greater than when this paper began their advocacy years ago. It is a national loss that the great basic industry of the nation is so unrepresented, and that the rights of miners should continue to be at the mercy of some little hundred-dollar-a-month clerk in Washington, who can make more contradictory rulings in a week than can be straightened out in a year. The only present suggestion that occurs to us is for mining men everywhere to show the power of their votes and require from Congressmen pledges of support to these measures, and of legislative candidates that they shall require from senatorial candidates satisfactory assurance that they will advocate these most necessary measures.

A Standard Necessary.

The need of an American Standardizing Bureau is manifest to all who have the advancement of science at heart, and it is hoped that during the coming session of Congress a bill authorizing the establishment of such a bureau will be passed. A bill for this purpose was introduced last winter and was favorably reported by the House committee having it in charge; the Senate committee on commerce, however, failed to give it consideration. Its present necessity arises principally from the electrical field. In the latter, while there is a standard volt and a standard ampere (although not fixed by law), we have no one standard for the unit of resistance—the ohm. An editorial in the issue of March 10th pointed out that there are at the present time four standards for the ohm extant, namely, the "legal" ohm, the "British Association" or "B. A." ohm, the "International" ohm, and the "Siemen's" ohm.

The "legal" ohm, adopted at Paris in 1884, was made equal to the resistance offered to flow of electricity (unit flow under unit pressure) by a column of mercury one square millimeter (0.03937 inch, or a small fraction less than $\frac{1}{25}$ inch) in section and 106 centimeters (0.4173+ inch) in length, the temperature being at the freezing point (32° F. or 0° C.) and the pressure of the air being equal to the pressure at the base of a column of mercury 760 millimeters (30 inches) in height. The other units differ from the "legal" ohm only in the matter of length of mercury column, so that in the adoption of a standard ohm the only thing necessary would be to fix upon some uniform and universal standard of length for the latter. In the matter of "candle power" also there is no standard.

The main thing, however, is to adopt invariable standards for the volt, ampere and the ohm, and when this is done the determination of other standards will be made easy.

GOLD DREDGING is proving to be a profitable form of gold mining in California as elsewhere, but extravagant statements are being made regarding the possible returns. The truth is good enough without exaggeration. A prominent dredger operator states that with his dredger in the last year he handled 320,000 cubic yards of material, which averaged 15 cents per cubic yard, at a total cost of 5 cents per cubic yard. This last item included every detail of expense, including interest on the amount invested. This, in round numbers, would mean the handling of 1000 cubic yards per day, at a daily net profit of $100, which is a fair average statement of results, and in this case a truthful one. Dredging is yet an evolutionary form of mining. Its origin was in New Zealand, in 1869, where the first dredging apparatus is described as having consisted of "a strong iron ring, technically known as a 'spoon,' to which was secured an ox-hide bag and a long pole. A rope was fastened to the iron ring and secured to a hand winch on the bank of the river. The bucket and pole were taken out and dropped into the stream by means of a boat, the bucket being pressed by the pole as deep as possible into the wash in the bed of the river." The bucket was then hauled ashore by the winch, and the contents put through a California cradle. The process from such primitive device to the $45,000 gold dredger of 1900, operated by electricity, illustrates mining and scientific advance.

COMMENTING on editorial reference herein in the issue of the 20th ult., to the projected absorption of the Guggenheim smelting interests by the American Smelting & Refining Co., several contemporaries have stated that "this will leave the trust in supreme control of all the smelting business of the mining States." The remark does not apply to the Pacific coast, where several large smelting establishments are in active operation entirely independent of any combination.

Concentrates.

"CONCENTRATES" is not acquainted with any method of "tempering" brass.

MACHINERY imported into the Argentine Republic pays a duty of 10% ad valorem.

ANY U. S. town with a population not to exceed 3000 can have a national bank with a capital of $25,000.

AN assay should be of a sample, not a specimen, to be fair to the owner or prospector as much as to the prospective buyer.

THE term "supernatant" is usually understood to apply to a liquid from which a precipitate has been thrown down.

GASOLINE ENGINES are feasible at any altitude. There is one in satisfactory operation near Silverton, Colo., 13,000 feet above sea level.

REFINING COPPER by the electrolytic method costs ½ cent per pound at Eastern refineries and three-fourths of 1 cent per pound at Anaconda, Montana.

GOLD having been deposited as a black or brown powder, by means of electrolysis, will again redissolve if the solution contains free nitro-muriatic acid.

"IT is a constant wonder to me how you can publish and send so valuable a paper fifty-two times for $3," is what an Arizona subscriber says in renewing.

NEW MEXICO'S mining statutes make void relocation of a mining claim to avoid the performance of annual labor, if made within ninety days of the abandonment of the first location.

QUESTIONS cannot always be answered in the issue next published after their receipt. A question that takes but two minutes to ask may take a month to secure correct or accurate answer.

SPODUMENE is a mineral mined near Custer, South Dakota, and is used as a source of lithium carbonate. It is worth about $25 per ton on board the cars at the mine ready for railway shipment.

EASTERN physicians say that many returned Nome gold seekers have developed symptoms of insanity. The fact of their going argued such development in some cases just prior to their departure.

SMOKE from charcoal pits is susceptible of economic saving. Each cord of wood contains 28,000 cubic feet of smoke—2,800,000 cubic feet smoke produces 12,000 pounds acetate of lime, 200 gallons, 25 pounds tar.

"CLIMAX" WIRE is a special wire made by Jno. A. Roebling's Sons, Trenton, N. J., containing about 24% nickel, and intended for use in electrical machines as "resistance wire," instead of German silver.

ROCKS cannot be classed precisely. There is no absolute type. A granite may shade into a syenite and a syenite into a diorite. Butte granite varies between a basic hornblende granite and a quartz diorite.

PERIODICALLY it has to be stated that the market for molybdenum ore is fully supplied. Molybdenite carrying 60% and not impregnated with copper, lead, zinc, etc., would bring about $175 per ton, delivered at Philadelphia.

J. B. HOBSON, manager Cariboo hydraulic mine, B. C., says that the top gravel there carries about 5 cents in gold per cubic yard; the boulder clay little if any; the gravel and bouldery ground on bedrock an average of 67½ cents per cubic yard.

MARCONI is understood to have established perfect independent wireless telegraphy from Poole, England, to St. Catharine's, Isle of Wight, a distance of 30 miles, by means of a pair of metal cylinders elevated 27 feet above the ground at each station.

THE next meeting of the California Debris Commissions to pass upon applications to mine by the hydraulic process will be held at the office of the Commission in San Francisco on the 12th inst., when eleven separate applications will be acted upon.

ANY speed is "dangerous" if the vehicle can not be stopped in a short space. An engine going 5 miles an hour is as dangerous as if it were going 50 miles an hour if the object is so near that the engine or vehicle can not be checked in speed. The question of speed is really one of brakes.

IT is difficult at any time, and ordinarily impossible, to name "the best" of any device. It can not be stated what is "the best" pump, though one may have his preference. Any pump well made by a man who has experience and intelligence would give good work under certain conditions and requirements.

THE simplest arrangement for parting silver buttons is a sand bath, upon which may be placed glass mattrasses containing nitric acid, the sand bath being placed upon a furnace until the acid is hot, then drop in the buttons and boil ten or fifteen minutes. Either Chapman's or Richard's filtering pumps are efficient.

GAS ENGINES may be divided, generally, into two classes—those effecting combustion at constant volume, and those securing that result at constant pressure. The Otto engine is the embodiment of the former principle, the Diesel motor of the latter. Ordinary illuminating gas contains about 650 B. T. U. per cubic foot.

THE Southern California Power Co., Los Angeles, Cal., has a 33,000-volt, 83-mile system. The Standard Electric project in central California involves the transmission of even greater voltage 150 miles. Under favorable climatic conditions there is no insuperable obstacle to successful transmission of 1000 H. P. over a wire 200 miles long.

GEO. F. BECKER of the U. S. Geological Survey says: "In such rocks as I have seen in the quicksilver mines of California wide simple fissure veins are not to be expected at any level, and irregular chambers are not so likely to be met with at great depths as at small ones, though they may occasionally be found at any distance from the surface."

THE Frue is a good type of the vanner; the Wilfley, of the riffle washer. The whole matter of concentration has as its basis the attribute of specific gravity, and, like nearly everything else connected with ore treatment, the quality of the ore and the surrounding circumstances must determine the manner of treatment in each individual case.

TO PREVENT the piracy of foreign copyists of American inventions "design patents" may be secured in foreign countries where patents are issued; or, a trade mark or a trade name may be adopted, registered in the U. S. Patent Office, and then registered with such foreign countries as have treaty relations with this country concerning trade marks.

THE arrangement with the cyanide patentees made by the Australian and New Zealand governments, respectively, was the same in both cases—the government bought all existing agreements for a lump sum of $100,000. The government royalty for use of the patent by cyaniders is 2½% till the purchase money is repaid, when further charge will cease.

A GOOD steam motor or "automobile" should be had for about $600; one in which gasoline furnishes the power, $1000; an electromobile, $1500. A gasoline automobile in some respects is preferable, and gives more power from a definite quantity of fuel than either of the other types. Automobiles are in use in San Francisco capable of going from that city to Los Angeles—600 miles.

TRUE "slimes" consist of the argillaceous portion of the ore existing in it, either as infiltrated clay, or as kaolin from the kaolinization of feldspars, or as hydrous magnesian silicates. This material is best separated from the granular part of the crushed ore by hydraulic classifiers. So long as the particles are granular, no matter how fine, they can be economically treated by leaching.

LOSERS of money in silly oil and copper investments have none but themselves to blame. Making inquiry after the event is in a line with such folly. A little careful inquiry before the investment would save such loss. Usually stock in a mining company is of value directly proportionate with the urgency displayed in offering it to the public—the more urgent the offer the less value to the proffered stock.

THE advantages of a Cornish pump are that it does good work, works well with clean or dirty water, and is so simple that almost any one can attend to it after a little practice. It requires little attention except to change the buckets, clocks, etc. Among its disadvantages are that it takes up considerable room in a shaft, it will not work economically with a throw of more than 250 feet and is of relatively great weight.

EVEN the meager $100 of annual "assessment work" on an unpatented mining claim is sometimes squandered and valueless when done with the idea that it is a sort of irksome Government tax to be perfunctorily performed "to hold the claim," being thus often done not where it would do the most good but where it can be done most easily. The true object of annual assessment work is to develop the property in the best interests of its locator, and thus add to its value.

FOR the treatment of cupriferous ores and concentrates which could not be treated successfully by ordinary cyaniding, Park and others claim to have obtained satisfactory results by first subjecting the ore to a chloridizing roast, and then leaching out the copper chlorides with water. After an alkaline and water wash the gold and silver contents were extracted by cyanide by percolation. During the roasting the silver sulphides present were chloridized to the chloride, which was then dissolved by cyanide.

THE law of Mexico prevents private ownership of mines by either native or foreigner. All mines belong to the Government, and the men or companies which work them do so by paying for a concession, and then paying a tax on the output. Anybody can get a concession if they can find one that is vacated. The holder must keep at least four men at work in useful employment about the mining plant. If he neglects to do so for a period of sixty days he may be denounced, and the denouncer can obtain the concession if he will begin work within sixty days.

SILVER in all its forms requires a stronger solution of cyanide to effect its solution than gold, and occasionally the large relative consumption of cyanide is due to the presence of silver sulphide—Ag_2S. The potassium sulphide resulting from the dissolution of silver sulphide also occasions a loss of cyanide. A trace of alkaline sulphide in cyanide solution does not act injuriously, but an appreciable quantity causes the precipitation of a portion of the dissolved gold in the vats. Some considerable percentage of this precipitated gold is redissolved by the excess of free cyanide present in the solutions, but in such cases as that under discussion it always requires this excess to obtain adequate extractions, thus necessitating the use of comparatively strong solutions.

A RENO, NEVADA, man asks: "Will you please inform me whether an ore containing a large percentage of black oxide of manganese has a market value?" This question is published to illustrate a usual mistake, viz., not giving sufficient data to permit intelligent answer. If the ore is a manganiferous iron ore, containing at least 6% to 8% of manganese, it would have a commercial value as a flux in silver-lead smelting. It might also have a value for steel makers; but, as the Reno inquirer does not state what the other constituents of the ore are, it is impossible to fully answer his question.

HE is not entitled to a patent who suggested the invention in dispute and made an experiment on a small scale, but did no more till another had devised it, obtained a patent and begun the manufacture. All inventions which are patented must be marked "Patented," together with the day and year upon which the patent was issued. In case of failure to comply with this law no damages can be collected. He is the real inventor, and entitled to a patent, who first makes a machine capable of useful operation, though others may have previously conceived the idea and made experiments toward putting it into practice.

TO EXTRACT the fragment of a drill, punch or other steel tool which has broken off while working any metal but iron or steel, the object containing the broken-off piece is immersed in a boiling solution composed of one part commercial alum to four or five parts water. This solution may be held in a vessel of stoneware, porcelain, copper, etc., but not of iron. The object should be so placed that the gaseous bubbles that form as the alum attacks the metal are easily disengaged. At the end of a short time the fragment of the tool is entirely dissolved. A piece of a steel spring .16 inch thick is dissolved in a concentrated solution of alum in three-quarters of an hour.

THERE is nothing illegitimate in bona fide sale or purchase of regularly issued stock in any legitimate enterprise, nor is there, necessarily, any more of a "gamble" in mining stock than in any other kind of stock rightly valued. As with a mine, so with a railroad or a bank or a factory. One could not well cut up the railroad or mine or factory into little bits and sell it in minute sections; but bits of paper called "stock certificates" can be issued, bought and sold, representing the tangible property, shares in which are thus susceptible of transfer. The owner of any number of shares owns just that percentage of the property so represented, and it is just as legitimate to buy or sell such shares as to buy or sell the property itself.

IN the electrolytic extraction of quicksilver from cinnabar the raw material is crushed to a fine powder, and then treated with a hot solution of sodium-sulphide containing caustic soda. The electrolytic vats are of iron, and may be used as cathodes; the anodes are of sheet steel. It is stated that the mercury can be readily separated from the upper part of the cell, and is enriched with equivalent amounts of copper, silver, zinc, cadmium, nickel and iron in the lower or anodic compartment of the cell. The solution on issuing from the cell is then passed through a series of vessels, in which the silver is displaced by copper by simple chemical action. Copper equal to about one-fourteenth of the weight of the alloy used has to be consumed in these in order to effect the desired precipitation of the silver. It is not possible to remove the last traces of silver by this method, but the amount found in the deposited copper should not exceed 0.3% when the process is working satisfactorily. After passing through a series of the sulphide solution, by using a current density of 0.5–0.8 ampere per square decimeter and an E. M. F. of two volts the electrolyte can be used again for extracting fresh ore after addition of sulphur.

IN the issue of Oct. 6th a method was given of making sodium amalgam. Wm. Crookes, the inventor of the alloy, has furnished more detailed directions as to its preparation. The mixture of sodium and mercury is in the proportion of three parts of sodium to ninety-seven parts of mercury. "Place a strong iron flask with a narrow neck nearly up to the mouth in sand on a sand bath kept at a temperature of about 300° F., weigh out the mercury and sodium, and put the former into a flask, and then add the sodium in pieces as large as a pea at a time, waiting for the action to cease before adding a fresh lump. The sodium had better be dropped in with a pair of tongs, and the hand should have a cloth over it. At each addition of the sodium a slight explosion is heard and a bright flame will issue from the mouth of the flask. The action gets less violent as the mercury becomes richer in sodium. When the whole of the sodium has been added, pour the amalgam into a flat dish while still liquid, and when cold break it up and preserve in a stoppered jar. It will not require to be kept under naphtha. The amalgam forms a mass of long, needle-shaped, brilliantly metallic crystals, which interlace in every direction, but have very little cohesion." The inventor recommends the use of the amalgam in coarse powder. By sprinkling it over the wetted surface to be amalgamated, then rubbing it over with a little clean mercury, a firmly adherent and brilliant coating of mercury will be given to the metal. The use of sodium amalgam has a tendency to keep the mercury bright and active, but it cannot be expected to perform any other part in the extraction of gold than in aiding amalgamation.

Machine Mine Rock Drills on the Pacific Coast.

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by by A. F. CHODZKO.

The Rand, Ingersoll and Sergeant drills have been in successful use for so many years, both in this and other countries, and are in consequence so well known, that a brief description of these machines will serve the purpose of this article.

The accompanying illustrations represent the latest forms in which they are found on the Pacific coast.

Each one of these rock drills is typical of a distinct class of valve motion, the Rand having a slide valve positively operated by the main piston through a tappet. The movement of the piston valve in the Ingersoll is controlled by the main piston, which covers and uncovers at the proper time the aperture of posts leading to both ends of the valve chest respectively (Eclipse type).

In the Sergeant drill the piston valve is also operated by pressure, regulated by a curvilinear auxiliary valve, shifted back and forth by contact with the main piston. In all of them the latter is recessed, and carries at its rear end a nut, engaging a rifle bar which imparts to the piston and its rod a twisting motion, by means of a ratchet gear. In the Ingersoll and the Sergeant drills the ratchet head is turned smooth, and carries some swinging pawls, which engage the teeth of a stationary ring in the ratchet box, while in the Rand drill the ratchet head carries the teeth, and turns against stationary pawls.

In all these machines the feed is effected by hand, at least for underground work, and flat or spiral spring buffers are located at the back end of the cylinder.

The shells are secured to the clamps by a conical heel, with the larger base outward in all of them.

Two distinct types of rock drills are manufactured by the Rand drill firm, and, while quite similar in many points, they differ in the arrangement of their valve motion. One of them, known as "Little Giant," may be characterized as follows:

Valve motion: Tappet operating a slide valve from underneath. This arrangement has been reproduced in the Giant drills of local make, previously described.

Rotary motion: Fixed pawls, movable ratchet head.

Feed: Hand.

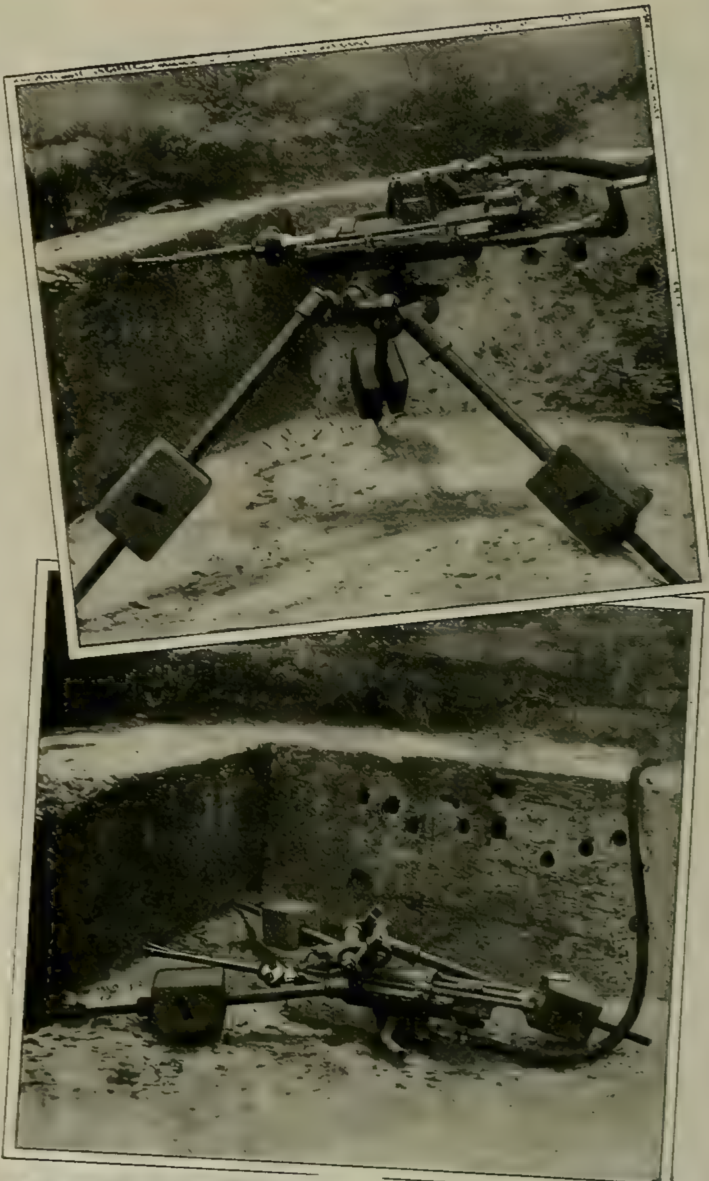
The other type of Rand drill, known as the "Slugger," is characterized by the following features:

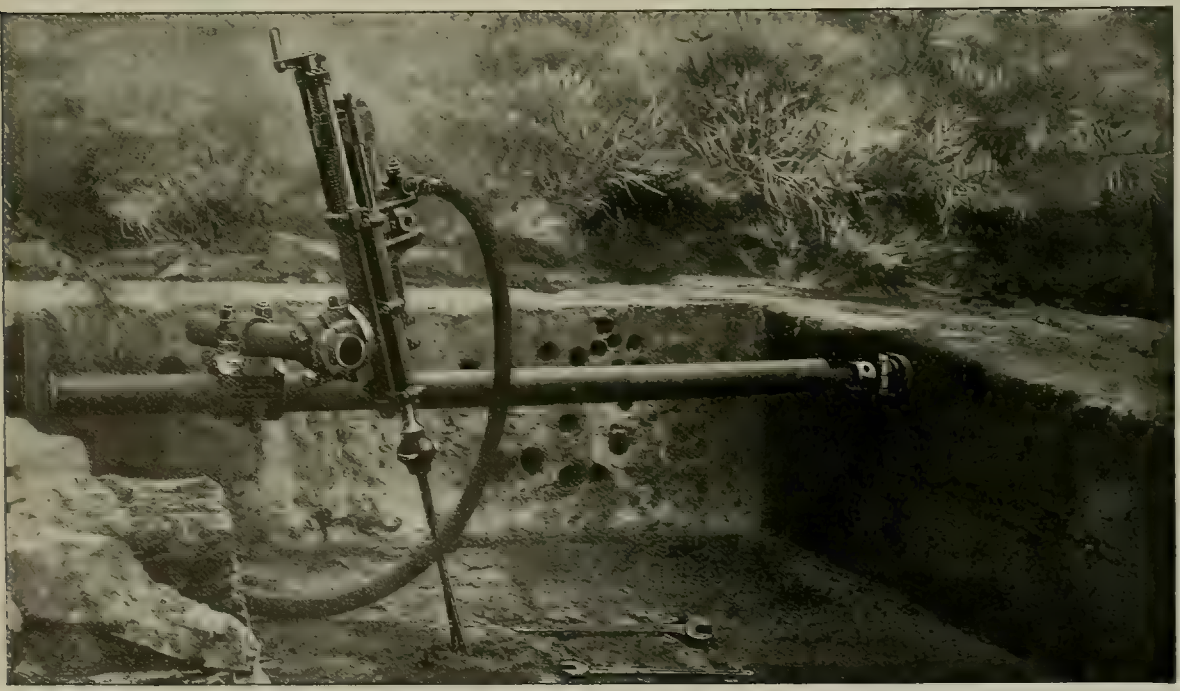
Valve motion: Balanced cylindrical valve, Eclipse type. It will be remembered that this appellation is merely intended to designate a piston valve operated by pressure, through the uncovering or closing of appropriate passages by the main piston of the drill.

These ports operate the valve by closing in the latter types of the Slugger, while they accomplish the same object by opening in some previous designs.

The momentum of the piston on the back stroke is checked by cushioning in all machines of this variety, but this is effected by a premature closing of the exhaust in some machines, and by a convenient amount of lead in others.

One distinctive feature of this type is the possibility of adjusting the point of cut-off so as to work expansively.





The Rand Drill.

Rotary motion: Stationary pawls and movable ratchet head.

Feed: Hand.

Several patented devices are found, namely, in the piston rod and chuck, in the attachment of the rifle to the ratchet and to the back head, in the split crank and feed nuts, in the adjustable shell slides, and in the throttles. These points can only be mentioned in this brief review.

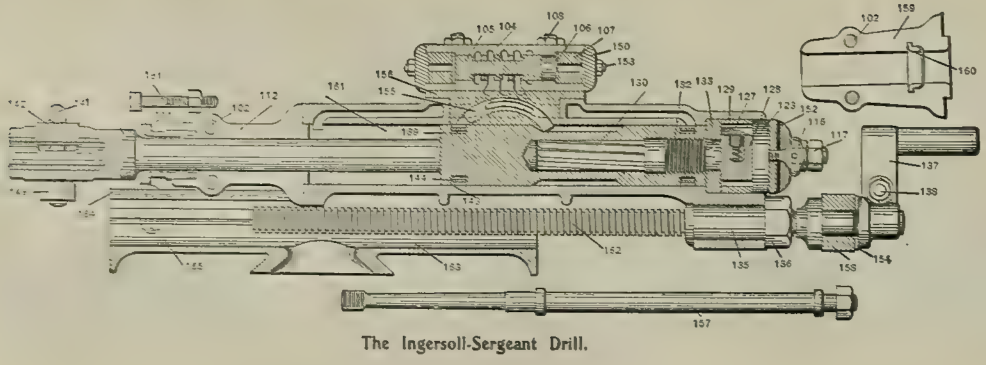
Some intermediate varieties of Rand drills are found in the market, combining the salient features of the two types just described. Such is the "Little Terror," which has a piston valve* in the exhaust nozzle, to vary the length of stroke when starting a hole.

All these machines can be operated by steam or compressed air at will, the change involving only a difference in the quality of stuffing-box packing.

The clamp used to secure the shell to a tripod or to a shaft bar or arm operates, in principle, by holding the boss of the shell with a movable dovetailed hook, secured in position by a nut.

* Operated by tappet and a restrictive valve.

(TO BE CONTINUED.)



The Ingersoll-Sergeant Drill.

New Concentration Method.

At a new tailings plant just erected at Kellogg, Idaho, it is intended to give practical test to what is considered a new principle in concentration of ore. The idea in practice is a movable table with either a wooden or a metal top, covered with a screen of wire or cloth, the latter being considered by the inventor preferable for very fine pulp. The feed runs onto the top of the screen while clean water is fed on the table from the sides, entering below the screen. The table is then given a reciprocating motion, the stroke being given by a cam while the return depends on springs. The quicker stroke of the cam forces the metals to the high end of the table, as in the bumper concentrator, while the water and lighter waste runs off at the lower end. The tables can be made any size, but those in use are 39 inches wide by 8 feet long, and the stroke can be made of any length required, depending on the weight of the metal being saved.

The water running directly onto the table below the screen has a free outlet; but the screen, instead of sagging beneath the weight of the feed on top, begins to rise in the middle as soon as the machine starts. Onto that the feed runs, the finer parts working down through the screen onto the table while the coarser runs off on top of the screen. The metal works to the high end of the table along the edges, while the waste is carried off. The metal which passes through the screen onto the table is forced back through it again when it approaches the high end of the table and follows the end of the canvas screen down to the settling tank under the table.

It is desirable that the pulp should be reasonably even. The manufacturers say that by the use of screens of different sizes any size pulp from two to eighty mesh may be handled, and a complete plant would carry tables with different screens, while a classifier would separate the feed into grades of the same coarseness. The motion of the machine makes the top of the water take a wave form, one wave pursuing another continually, and the rolling motion thus given the surface carries the floating particles down, and, once submerged, it is claimed that they sink to the bottom "as soon as the water is still enough."

A Labor-Saving Device.

In mining and metallurgical work the present constant effort is to reduce cost of operation. So effective is this tendency that in many instances the cost is less than one-half what it was ten years ago.

More especially is this ever-present effort at economy manifest in handling materials. Among other labor-saving equipments are reciprocating conveyors, one system of which is portrayed in the accompanying illustrations, which show the device in successful operation at the plant of the Eureka Cyanide Co., Mound House, Nevada, put in about two years ago by Hey & Patterson, 51-53 Water St., Pittsburg, Pa. The illustrations make little explanation necessary; regarding the driving mechanism, it will be noted that one main crankshaft moves all the machinery. In their reciprocating conveyor the only moving part in contact with the material is the flight, which is inexpensive and easily replaced. Detailed particulars will be sent to any one interested.

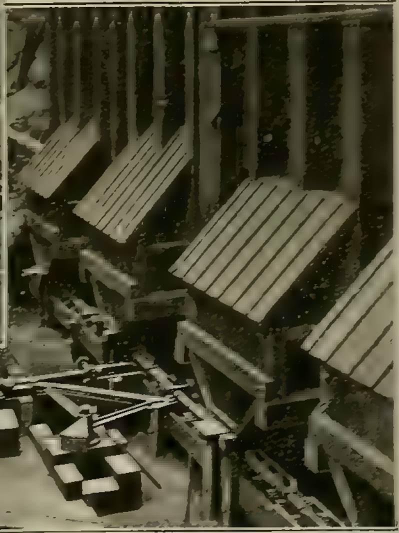

FIG. 6.

California Quicksilver Mines.

At Savonas, B. C., Douglas county, Or., and Terlingua, Texas, are reported quicksilver deposits commercially profitable, but the only continuously profitable deposits of cinnabar in the United States have occurred in California, and in that State about all the mercury used in America or exported is produced. The ore is usually of a deep red color, soft, easily scratched with the nail, and its streak is of a bright vermilion hue. There are two other varieties, one a selenide of mercury. Tiemannite looks like a telluride of lead, its streak being dull grey, the same as galena. The other, metacinnabarite—black mercury sulphide—looks somewhat like graphite or black lead, but is hard, with a fracture similar to grey copper and streak the same color as the mineral itself. These latter are of rare occurrence and are seldom found in quantities of any commercial value. The ores of quicksilver usually occur in or near to dykes of serpentine, although one of the best mines in California—the Oat Hills mine, Napa county—is almost entirely in a soft, white sandstone. The deposits seem to be strongly allied to mineral springs, it being not uncommon to note volumes of hot water charged with sulphur, salt, magnesia, iron, lithia, lime and soda. The gases accompanying are marsh gas, sulphuretted hydrogen, chlorine and carbonic acid, which sometimes occur simultaneously. Consequently the water is unfit to use in boilers, and is hard on pumps or any iron machinery. In these mines when any hot water exists the temperature is from 120° to 150° F. Artificial ventilation with power and fans is resorted to. The temperature goes down to about 85° when connected with the surface by air shafts and tunnels. In mines where there is no hot water the temperature seldom rises above 100°. The artificial ventilation is also used there until two or more openings to the surface are made. In some of these mines petroleum in considerable quantities is found, and a hair-like growth of epsomite grows from the walls and floors in great quantities, sometimes attaining a length of 10 to 12 inches. It is a beautiful white and gives the old and abandoned workings a most striking appearance. Occasionally large bodies of nearly pure sulphur are found. The ore is mined by the same general processes as silver and gold—with hammer, drills and Giant powder—the ordinary quartz miner doing the work at $3 per day of ten hours. The ore is dried, either on steam tables or on top of the main furnace, and is then dumped into the top of the furnace, which has two airtight coverings, each moved by levers, independently of the other. The top cover is removed and a charge of about one-quarter of a ton is dumped in on the lower cover, then the top cover is closed and the lower one opened, allowing the charge to drop into the furnace.

which is not very hot. A heat of about 700° F. is needed in the hottest part of the furnace, which is at contact with the fires, the mercury becoming vapor between 600° and 700°. The firing is done with wood, it being cheaper than coal in California. With some of the ores little wood is needed, as the sulphur in the ore when burning maintains nearly enough heat to reduce the quicksilver. The discharging of the roasted or burned ore occurs at the same regular intervals as charging, so that an even quantity of ore is constantly exposed to the fires for about thirty hours. The entire fumes from the furnace, consisting of mercury, petroleum, wood oils, creosote, sulphur, acids and water, are carried through tight flues into condensers, either built of brick with many compartments or of cast iron connected by flues, from which perhaps 60% of the mercury will flow into catch basins. The residue is called soot and contains mercury, charcoal (wood ashes), oil, sulphur, salt, etc. This residue is first treated with a bath of strong alkali to remove oil and grease, then mixed with four times its bulk of quicklime, which is allowed to slack in contact with the soot. It is then put into shallow iron pans and charged into cast iron retorts which hold from 600 to 700 pounds. This is treated at a low red heat for twelve hours, when no mercury should be left in the residue. From the retort there is an exit pipe, which is water jacketed, through which the fumes pass and are recondensed. The mercury is recovered in a pure state and is put into wrought iron bottles or flasks containing 76½ pounds (a Spanish measure) and shipped to market.

There is little danger, ordinarily, of the miners getting salivated. If the mechanical condition of the furnace, draught and condensers is good, and no leaks are allowed, there is no danger at the furnace. White men have charge of the furnaces, but considerable of the work of handling ores, soot and quicksilver at the furnaces is done by Chinese.

Ores of mercury containing one-half of 1% mercury can be treated at a profit. Its uses are for plating, for making Chinese vermilion, for medicines, as calomel and other preparations, for making fulminate of mercury, the high explosive used in Giant caps and other detonators, and for amalgamating gold, silver and copper in quartz mills and placer sluices.

Nome and Northern Alaska.

Written by a Returned Prospector.

While the Nome rush, on the whole, was a failure, it is manifestly unfair to condemn the region on that score, as several things conduced to that result.

Although too much stress was laid upon the beach diggings, the latter, undoubtedly, drew the majority of those who went to Nome this spring, and the fact that it would play out was not figured upon. The beach was worked until late in December, 1899, and again early this spring; consequently, there was little left for the vast majority of new comers, a great many of whom were inexperienced and unprepared for such an emergency. As a result, "cold feet" became prevalent and demoralization generally ensued.

Those who had arrived a short time before with high hopes, returned to the States with those hopes shattered and thoroughly disgusted with the region.

Outfits on all sides were sold and prices nearly touched bedrock. To those who went up to prospect and locate river and creek claims, additional difficulties presented when it was found that the whole country within a radius of from 150 to 200 miles from Nome had been staked during last winter.

Notwithstanding these drawbacks, considerable prospecting and new work were done during the season.

While results so far, outside of Snow Gulch, Anvil and Dexter creeks, in the Nome district, and at Tapkok, in the Bonanza district, have not been phenomenal, they have been sufficient to show that there is gold in paying quantities in the region, which, when litigation is settled and things are put on a sound basis, may turn out to be a large producer.

GOLOVIN BAY DISTRICT, ALASKA.—The Golovin Bay district, comprising the Inland, Big Four, El Dorado, Discovery and Blake mining districts (now merged into one, with recording office at Council City), is drained by the Fish, Keuchablock, Neukluk and Casa de Paga rivers and tributaries. Mining operations have been carried on principally around Council City (now called Golovin City), for the past two or three seasons. This season principal work was done on Willow, Ruby and Banner creeks, in Inland district; on Dixon creek, Big Four district; on Ophir, Sweetcake, Elkhorn, Warm and Crooked creeks, in El Dorado district, and on Melsing creek, in Discovery district. Results were good—yield averaging about $30 to the shovel per day.

Ophir and Sweetcake are the banner creeks to date, some of the cleanups having run from thirty to forty pounds this season.

A two days' run on Ruby returned $400, four men working claim.

Council City, with a population of about 1000, is about 80 miles from Nome overland and 120 miles by water. It is on the Neukluk river, 9 miles above the Fish river, and 40 miles above Chenik, on Golovin bay.

Council lies in a belt of spruce, making fuel and building material at that point comparatively cheap.

Wages this season were $5 per day and board.

Bedrock, principally mica schist and shales, is variously found from 1½ feet down. Values in some cases are found from surface down, but generally a foot or two of stripping is required before pay is struck.

While comparatively unknown at the present time, Anvil and Dexter creeks, Snow Gulch and Tapkok having occupied the attention of the outside world as good producers, those owning claims in the district figure on an active season.

The Ruins of Mitla, Mexico.*

Written for the MINING AND SCIENTIFIC PRESS.

Oaxaca, Mexico, is not only a rich country from a mineral standpoint, but is one of the most attractive to the tourist. In the valley of Tlacolula, 20 miles southeast of the city of Oaxaca, are to be found the ruins of Mitla, looked upon by all scientists who have visited them as the crowning achievement of an ancient and vanished people. Just when Mitla was built or by whom nobody knows. The ruins were discovered by the Spaniards who invaded Mexico in 1521, when all records found were destroyed. They are now just as they were then; 379 years has not made the slightest change. The building of the Mitla had its birth so far back in the twilight of time that naught but tradition remains. Among the Indians who inhabit the hamlets adjacent to the ruins traditions are rife. The inhabitants of these villages are descendants of the Zapotec Indians, and they claim that at one they were a great and powerful people, and that Mitla was the dwelling and burial place of the Zapotec kings.

The ruins of Mitla are peculiar to themselves, being of stone; they partake of no known civilization and have no likeness either to the ruins of Yucatan, which lie to the northeast, or of those in central Mexico, lying to the northwest. Situated as they are between these historic points, it is supposed by some to be a connecting link. Travelers and explorers who have visited all these old relics of by-gone days, and have spent weeks and months in their study, find that Mitla stands alone, conspicuous for its singularities of architecture and ornamentation.

Bancroft, the eminent antiquarian, says in "Native Races of the Pacific Coast:" "Mitla is probably the finest group in the whole Mexican territory. Here was a great religious center, mentioned in the traditional annals of the Zapotecs, the original name of which seems to have been Lioba, or Loba, the place of tombs; called by the Aztecs Miquitlan, Mictlan or Mitla, (place of sadness), dwelling of the dead, often used in the sense of hell. The gloomy aspect of the location accords well with the dread significance of the same. A stream with parched and shaded banks flows through the valley; no birds sing or flowers bloom over the remains of the Zapotec heroes."

The ruins are in five groups; three of them are well preserved and attract the most attention. One group is about 120x100 feet, with walls standing 15 to 18 feet high, enclosing a large court, or patio; around this patio the walls are laid off in oblong panels, built in the most unique designs in bas-relief, mosaic in character. The largest group is about 300 feet long by 110 feet wide. The walls are about the corresponding height as those described above, and about 6 feet thick. They have the same character of mosaic decoration, but different in design, each panel being unlike any other in the ruins. Sculptured columns or frieze are conspicuous by their absence, and that is one of the marked differences between these and other ruins in Mexico. The walls of Mitla are built of a most peculiar design, being formed of small pieces of stone from 1 to 6 inches in length, 1 inch in depth and 2 inches in breadth, very accurately cut and built into the face of the wall, forming most complicated patterns that baffle description. These mosaics, all the figures of which are rectangular or diagonal, give the distinctive character to Mitla that distinguishes it from all others. The engraving on the front page, giving the detail of appearance of this wall, built of mosaic, is the first time any such picture was ever published.

At Yucatan the hand of the sculptor has left its imprint, that has lasted from time immemorial to the present, and makes them attractive to the tourist, who makes long pilgrimages to view them. Palenque is visited by thousands to view the relics of the ancient sculptor, made famous for its odd designs in stucco in bas-relief. Copan is visited by scientists, archæologists and tourists to study its idols and altars—upon the discovery of which and the stupendous work achieved by a people now extinct volumes have been written. But, after a careful study and investigation of them all, Mitla stands out in bold relief in the minds of all who visit them.

In 1802 Don Luis Martin and Col. De le Languna visited these ruins and gave to the world the first sketch ever made of them, from which the illustrations used in the past have been made. In one of these ruins is an underground passage or chamber, and referred to by the guide as the "subterraneo." In shape it resembles a cross. Leading from this passage, somewhere in the ruins, great treasures are hidden; and it is claimed that their exact location is known to one old Indian, who occasionally, when unobserved by his neighbors, extracts therefrom sufficient to maintain an humble existence. It is also said that in one of these ruins is a large room filled with mummified bodies of the Aztec kings. Whether this be true or not it would be hard to say, but such explanations from the guide who accompanies all visitors are not disputed, as it would be in keeping with the general surroundings, and one feels as though it were true. Tourists in visiting Mitla in the past have disfigured the beautiful walls by chipping off pieces. The Government has taken the matter in hand, and now no one is allowed to enter the ruins without a guide, who sees that no further destruction occurs. The lintels of some of the doorways are of mammoth blocks of stone, one of which is 19 feet long, 3 feet thick and 6 feet wide. Just how these monster blocks were raised to their present positions is a matter of conjecture. Like the massive blocks found in the pyramids of Egypt, no one can form a theory that will satisfy the inquiries of to-day as to the method used.

In one of the large rooms is a long row of columns, standing in perfect line; these columns are about 14 feet high and 3 feet in diameter, and are peculiar in themselves, having no base or pedestal, capital or architrave. In the patio, at the entrance of this room, stand two of these large columns. In September, 1899, Martin Gonzales, the present Governor of Oaxaca, removed one of these columns and placed it in the Passao, to add to the attractive features of this drive. The removal was accompanied with no end of objections from the inhabitants of Mitla, and to maintain order it was necessary for the presence of a batalion of soldiers under stern leadership to effect the desired object.

All tourists are beset by a score of little Indian girls offering for sale pieces of Aztec pottery, faces of idols and beads, said to be found in the ruins and unearthed during the excavations done there some years ago under permission from President Diaz. It is remarkable how keen the sense of business is in these forlorn Indian children, who evade close questioning as to where they were found or how they came into their possession, as nothing that would lead one to believe they were genuine can be seen in the surroundings; nowhere is there the semblance of the handiwork of the sculptor to be found in these vast ruins; which makes it suspicious. These articles are often bought by visitors as mementoes of the trip, regardless of their genuineness as antique relics.

*See illustrations on front page.

Raw Hide Gears and Pinions.

The New Process Raw Hide Co. of Syracuse, New York, are the patentees and sole manufacturers of new process raw hide noiseless, solid raw hide spur, bevel and friction gears, bushings, washers, bound mallets, etc., their goods being the result of ten years of experience and experiment. To any one having use for their products the illustrations on the front page are of interest. Fig. 1 represents a raw hide spur pinion, complete, which the makers claim is "so made as to wear as long as metal or any other composition now known." It is noiseless—a special feature in their gear. Fig. 2 is of a solid raw hide blank, for those who prefer to cut their own raw hide gears. Fig. 3 portrays the largest raw hide gear wheel yet made, 33¾ inches pitch diameter, iron shrouds and center. Fig. 4 shows a pair of 19-inch bevel wheels, one of new process raw hide, the other of cast iron, made for the U. S. Government. Fig. 5 illustrates a number of large spur and bevel pinions which the New Process Raw Hide Co. of Syracuse, New York, recently made for one of their customers. Most of these, it will be noted, are made with iron centers, a form of construction which they adopt for gears of large size. In mining and electrical operations these goods are of value, and any one interested can have full particulars and testimonials from pleased customers on application.

IN a recent issue was noted the rise in the price of the "diamonds" used in diamond drills. Such rise is occasioned by increase in the demand and decrease in the supply. A drought in the province of Bahia, Brazil, caused paralysis of the industry there. It is probable that there will be a further rise, and diamond drill manufacturers have been trying to find a substitute for the expensive carbons.

AT the Paris Exposition the mill engine is not in evidence, and appears to be ceasing to exist on the continent. There is not a main driving belt nor a driving rope at work in the Exposition. All the large engines, without exception, are employed in driving dynamos, for the most part of the flywheel types, and these supply power where it is wanted through cables led in various directions.

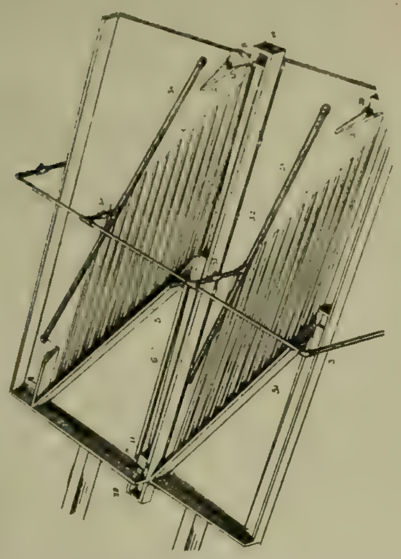
THE cost of electrical power in large Philadelphia machine shops averages 1.2% of the shop pay roll.

Mining and Metallurgical Patents.

Patents Issued October 23, 1900.

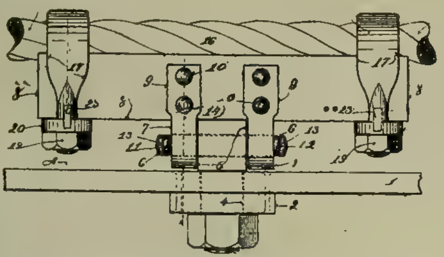
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ORE SEPARATOR.—No. 660,342; J. P. Smith, Denver, Colo.



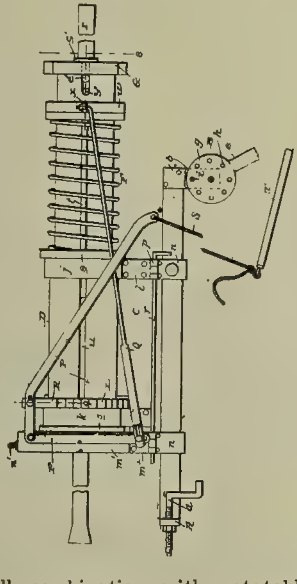
An ore separator, transversely inclined tables with longitudinally disposed guides, diagonally disposed slime conveyors, intermediate return conveyor by which slimes and heavier separated material are transferred from first to second table, mechanism consisting of advancing cam and return spring by which tables and conveyor are reciprocated, second spring interposed between mechanism and tables, compressible by inertia of tables during forward movement, plane section of cam just previous to offset which allows return movement of tables, whereby forward movement of tables ceases and second spring is allowed to expand just before return of tables.

WIRE ROPE AND BUCKET CLIP.—No. 660,395; B. C. Riblet, Nelson, B. C.



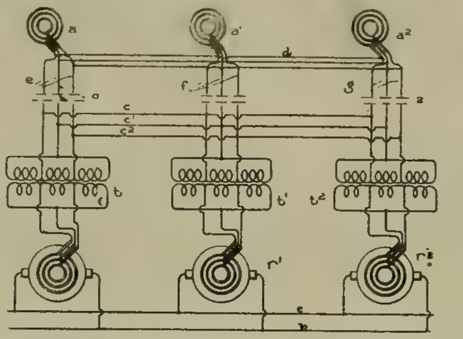
In rope and bucket clip for aerial tramways, combination of rope and cross bar of bucket, rope bar, clips, straps, dowel pins, two lugs provided with strap portions adapted to be secured to bar, pin extending through lugs secured thereto, bolt pivotally mounted on pin arranged to swing in vertical plane, stops on bolt arranged to engage bar, adapted to define vertical movement of bolt above and below horizontal center of pivotal pin, shoulder on bolt, round portion adjacent to shoulder, bucket cross bar pivotally mounted on round portion, nut threaded to end of round portion adapted to secure cross bar bolt.

ROCK DRILL.—No. 660,409; C. E. Young, Fremont, Wash.



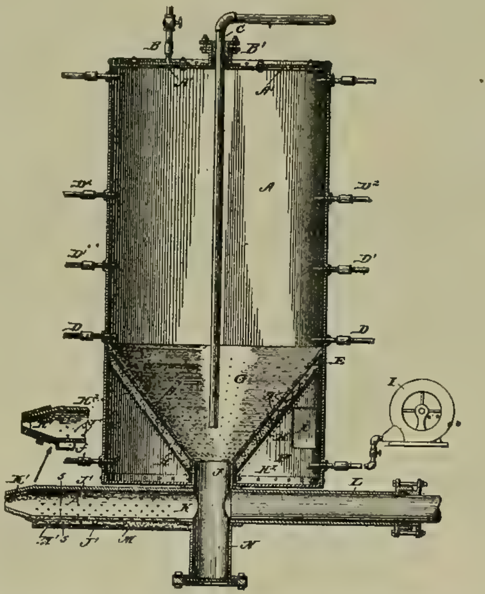
Rock drill combination with rotatable drill-rod holder comprising tubular section held against endwise movement, endwise movable tubular section arranged in and connected to first-named section so as to turn therewith and move endwise with respect thereto, having longitudinal slots, slotted guide pieces connected to endwise movable section of holder, having inwardly directed and recessed arms at inner ends, outwardly directed arms at outer ends, collar loosely mounted on endwise movable section, having offsets; of drill rod arranged in holder, having lateral arms arranged in slots in endwise movable section thereof, also in slots of guide pieces.

TRANSMISSION OF POWER.—No. 660,483; E. J. Berg, Schenectady, N. Y., assignor to General Electric Co. of New York.



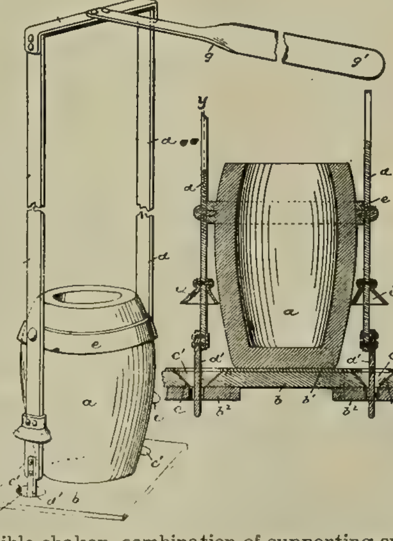
Combination of source of alternating current, plurality of rotary converters fed through separate transmission lines running back to source, conductors connecting together direct-current terminals of converters, and conductors connecting together alternating-current terminals of converters.

APPARATUS FOR LEACHING ORES.—No. 660,498; J. A. Fleming, Globe, Ariz.



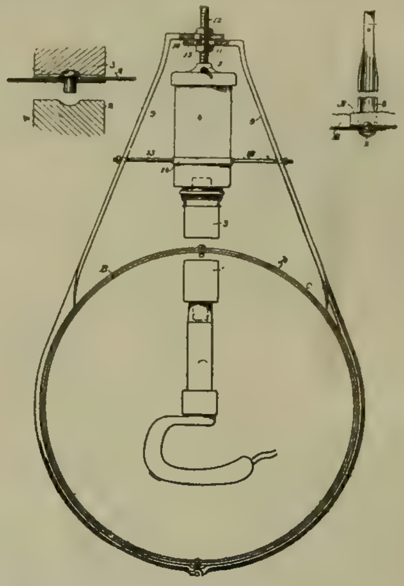
In ore leaching apparatus, combination with leaching tank having pulp discharge of conical perforated filtering hopper therein having discharge for pulp, means to maintain air pressure below diaphragm whereby to control flow of solution through it, means for introduction and withdrawal of chemicals to and from body of tank above filtering diaphragm, and devices for controlling discharge of pulp from tank.

CRUCIBLE SHAKER.—No. 660,387; W. S. Mather, Newark, N. J.



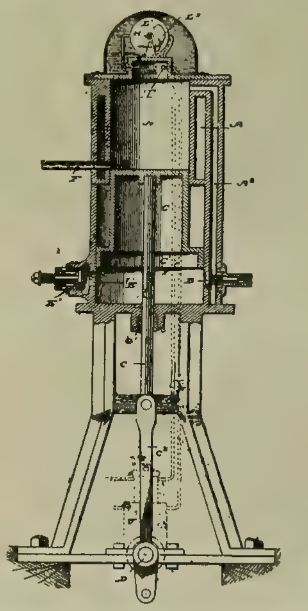
Crucible shaker, combination of supporting surface for crucible, upright legs at sides of crucible, carrying between themselves means for grasping crucible and being pivoted at a point away from grasping means, jointed handle connected to legs for oscillating them.

PIPE RIVETING MACHINE.—No. 660,542; S. Foreman, Sacramento, Cal., assignor to the Schaw, Ingram, Batcher & Co., same place.



Combination in riveting device for pipe sections when being laid, pneumatic hammer, tool carried thereby adapted to form heads upon ends of rivets interior to tube, holder exterior to tube, anvil carried thereby chambered to fit exterior head of rivet, support for holder consisting of band, channeled to inclose circular line of rivets around joint, with edges of band resting upon surface of pipe, joint whereby band sections may be opened or closed, converging extensions of band opposite to joint tangential with pipe, bent and overlapped, having openings therethrough, bolt passing through opening fixed to holder, locking nuts by which it is adjustably secured to ends through which it passes.

VALVE GEAR FOR EXPLOSIVE ENGINES.—No. 660,090; C. P. Blake, Chester, Pa.



Explosive engine combination with cylinder, piston and crank shaft, of cam shaft, valve controlling cam carried by shaft, circumferential groove in cam governor lever pivoted on axis parallel with axis of cam, branch groove into which controlling lever may be deflected, governor lever carried by cam, longitudinally movable slide connected with governor lever projecting into circumferential groove for deflecting controlling lever into branch groove.

METHOD OF TREATING TELLURIDE ORES.—No. 659,670; C. J. Head and R. C. Wild, London, England.

Process for extraction of tellurium from telluric ores, consisting of lixiviation and digestion of ores for from four to six hours in a solution containing about 5% caustic potash or soda; removal of filtrate; acidifying of filtrate; precipitation of tellurium from filtrate by protochloride of tin.

THIS oblate spheroid, the earth, has been measured by the U. S. Coast and Geodetic Survey. This is the first time such work was accomplished. It was begun in 1871. The equatorial diameter is 7926 miles; pole to pole 7899 miles. In U. S. territory the 39th parallel of north latitude, from Cape May, N. J., to Point Arena, Cal., is 2625.6 miles in lateral extent.

How to Build Good Roads.

In the issue of the 20th ult. appeared an editorial on the necessity for good roads as a business investment in mining districts. A California county supervisor in a discussion on that subject says:

In building a road the first thing to be considered is its location, a mistake in locating a road may cost the taxpayers large sums of money and never get a satisfactory road. I hope this discussion will lead to broader views on the subject.

I think we are sometimes so anxious to have the road located where it will benefit us most at present, or do us the least damage, that we overlook the importance of locating it on the best ground. Some one has said that no ground is too good for a road. As a result of mistakes in locating roads we have now in the fourth road district in my county (San Diego) three roads leading to Palomar mountain, or rather from the base to the top of the mountain, two of which ought to be vacated; one to the Escondido reservoir, one to Guejito and two out of the San Pasqual valley ought also to be vacated. The cost of these grades must have been thousands of dollars, but they are so steep and narrow as to render them dangerous. I think the people ought to get together and coöperate to get the road in the best place.

Those steep grades before mentioned are not cited to find fault with any of my predecessors, for I do not know who built them; it is roads we are discussing, not men. There is one thing evident to me, that is, we have too many roads or not enough money, I suppose both are true.

In my opinion we should have a law classifying the roads into three classes. Class one should be State roads, built and kept in repair with State funds. Class two should be county roads, built and kept in repair by a tax levied on all the property of the county. Class three should be district or neighborhood roads, built and kept in repair by a direct tax levied on the property of the district and a road poll tax which may be worked out if preferred. Class one should be under the supervision of the county surveyors of the counties through which they pass. Class two should be under the supervision of the board of supervisors, and class three should be under the management of a road overseer or some other local management.

I think there will be no disagreement as to classes one and three, but there may be some objection to taxing incorporated cities for road purposes. But I should place the cities in a catalogue with districts which must help to build and keep in repair both State and county roads, and in addition must build and care for their own roads. It would seem but fair that cities should help in like proportion on the State and county roads and in addition keep up their own streets. I think a system of good roads leading to a town or city tends to build up business of all kinds; then I believe that it is as much to the interest of the cities that country people should come to their places of business as it is important that country people should have a market and a good road to get to it. And by thus doing away with sectionalism, and city and country uniting heart, hand and purse we could bring about such a revolution in road building and care as to result in great improvement. I feel greatly indebted to the cheerful kicker's protest against present conditions. Continue still to point out the mistakes and blunders and "show us the more excellent way."

Returning to the subject of locating roads, it appears from the records that deeds to right of way for roads had never been recorded until within the last five years, and in some instances we have been compelled to buy the right of way for roads that we thought the county owned, at least they had been declared public highways by the board of supervisors and worked with public funds, and sometimes we are obliged to pay an exorbitant price or enter into an interminable lawsuit to condemn the right of way. One instance I have in mind, which was begun four or more years ago, was recently dismissed, and still no road. Now, in my opinion, there should be a maximum price established by the Legislature, based upon the assessed valuation of the land (say two or three times as much as it is assessed for), and the damage assessed as now by disinterested appraisers or viewers sworn to faithfully and impartially perform their duty.

Roads have in some instances been laid out without the least regard for the necessity for their construction, the number of people they would accommodate, the sums of money they would cost, or the territory they would develop.

Considering the subject of funds for road building, the tax we are now permitted by law to levy for road purposes is little more than enough to keep in repair the roads as they are now, and to contemplate any radical reform or build any Macadams or Telfords would require funds far in excess of any sum the board of supervisors has ever at any one time had its disposal; hence, before any of these great improvements are made there will have to be some methods adopted to supply more funds. We have voted bonds in the past upon which we are still paying interest. I should certainly not favor bonds until every other or at least some other plan had been tried. I think permission should be granted by the Legislature to counties to issue scrip, based on the assessed value, not to exceed 1%.

I am sorry that the Legislature repealed the "wide-tire law." I think it ought to have been amended so as to exempt old wagons and refer only to new wagons and those built or sold in the State after the law took effect. Ten States in the Union have at different times enacted wide-tire laws, and some of them have been in operation for a long time, at least long enough to thoroughly test their utility. I refer particularly to New York, Ohio, Indiana, Kentucky, Vermont, Michigan, Pennsylvania, Massachusetts and California. I admit that there are instances, perhaps, where a wagon with a wide tire will draw heavier than one with a narrow tire—for instance, where the ground is soft enough for the wide tire to cut through; but in all other places, except those referred to, the wide tire draws lighter than the narrow. If there were no difference in this respect the benefits to the roads are such as to urge their use. Indiana, Kentucky, Vermont, Pennsylvania and Massachusetts all make distinction in favor of the wide tire. Experiments made in New York are very much in favor of wide tires. Experiments have been made in Ohio, Missouri and Vermont, in each instance with the same result. Austria, France, Germany, Switzerland and Canada (according to Consular reports), all favor wide tires, and some of them have laws enforcing their use, France in particular. I quote from a report: "Every freighting or market cart here is a road maker; its tires are from 4 to 10 inches wide. With the few four-wheeled freight vehicles used the tires are rarely less than 6 inches in width and the rear axle is about 14 inches longer than the fore, so that the rear or hind wheels run in a line an inch outside the level rolled by the fore wheels." Whether we have a wide-tire law or not every person ordering a new wagon should insist on having wide tires.

E. H. CLEAR, a New York "promoter," is gravely announced in an electrical journal as "organizing a company to operate automobiles along the Yukon river to convey miners and machinery to the Klondike." To any one with the slightest knowledge of the facts the statement is ridiculous.

A STRIKING EXAMPLE of the extent of the advance in prices of iron and steel last year is afforded by a statement made in the annual report of the Chicago Great Western Railway for 1899. It seems that this road has actually exchanged old rails for new at a profit. They purchased 10,000 tons of 75-pound steel rails at $19 per ton. While they were being laid and the old ones taken up the iron market advanced to such an extent that the old rails were sold for about $10 per ton more than the new ones cost.

Artificial Fuel.

Regarding the manufacture of patent fuel in Wales, U. S. Consul Phillips can see no reason why a pound of bituminous or anthracite coal dust should be wasted, nor why the industry should not succeed in the United States. He says the agglomite process of manufacturing patent fuel from anthracite and bituminous minerals is entirely different from any other. By this method the coal and agglomerates are chemically mixed while under the influence of heat and pressure, in a sealed vessel, by which a new fuel compound is produced. The process is as follows: The coal and agglomerates are mixed and ground in a dry state. If tar or pitch or other liquid substances are used they may be subsequently added; then the prepared material is put into a hopper attached to the end of a horizontal tube. The opposite end of this tube is connected with a briquette press. A worm is kept constantly revolving in the tube, conveying the material through the tube and feeding it into the pressing ram chamber. The tube passes through a small furnace, which enables the machine to become heated to a temperature of 500° or 600° Fahr. The gases evolved cannot escape, hence the pressure produced within the tube is shown on an attached gauge to be about ten pounds per square inch. Practically, the tube is an automatically sealed vessel, for the closely packed mass of coal materials fed from the hopper into one end of the tube by the revolving worm and the hot plastic mass fed out by the same worm into the pressing chamber at the other end of the tube is so closely blocked up by the passages as to overcome the internal pressure of ten pounds per square inch created by the hot gases. These gases, under pressure, permeate the hot plastic mass, which is turned over and over as it travels slowly along the sealed tube. Millions of tons of anthracite coal dust now thrown away can be successfully utilized in this manner. It will not take long for our quick-witted Americans to master details.

Manufacture of Circular Saws.

Circular saws are made of cast steel specially manufactured for the purpose. A steel ingot heated to the requisite temperature is reduced to the proper thickness in powerful rolls. The plate is then centered and a circle scribed upon it, after which it is passed to the shearer, who reduces it to a circular form. The center hole is then bored; it is handed to the toother, who punches out the teeth around the edge, after which they are rough filed or ground on an emery wheel, to take off the burr left for punching. The rough saw is now again heated in a large furnace until it is of bright red color, then plunged into a bath of sperm oil, which makes it hard and brittle. The oil is then partly cleaned off, and the rest burnt off in a furnace to give the saw the required temper. When cold the saw is hammered on a steel-faced anvil until it is straight. It is next ground between vertical grindstones revolving in opposite directions, and then polished with emery on a large disk. Once more the hammer men take it and strike it with smooth-faced hammers on an anvil as before, until it is absolutely straight and true and has acquired the proper tension, which allows for expansion while the saw is revolving at work. The teeth are now set, alternately right and left, to allow for clearances when sawing timber. They are then sharpened by being filed on the front and tops of the teeth, which operation completes the manufacture.

THE Sultan of Johore, in the southern part of the Malay peninsula, has ordered $750,000 worth of American electrical machinery.

Rights of Employes to Their Inventions.

By a recent decision of a German court an employe in that country has no right to any invention he may make so long as he remains an employe. The following statement of the relations between employers and men in the United States as regards inventions made by the latter is of interest:

"In general, the law secures to every man the ownership of his own inventions and of the patent granted therefor. But this general principle is much modified by the special relations existing between the employe and his employer in particular cases. A wide distinction is made between the person who is employed merely as a skilled workman and the person who is employed as an inventor.

"As to the former: If a skilled workman, while in the employ of another, but in his own time or after working hours, conceives an invention and constructs it at his own expense, using his own tools and materials, and doing the work after hours or in time his employer does not pay for, then the invention, as well as the patent granted therefor, is the exclusive property of the workman. The employer has no rights in it, nor any right to use it in his business, even though it is adapted to that business. The employer in this case can obtain the right to use the invention only by contracting with the workman for it and paying the price agreed upon. But if the workman conceives the invention in the time his employer pays for, and constructs it with his employer's tools and materials and in the employer's time, then the employer obtains certain rights in the invention and patent granted therefor.

"If the invention is a machine, then the machine belongs to the employer, and he has a license to use it in his business and to keep it in repair, and without paying any royalty to the workman therefor. If the employe obtains a patent for the invention and sells it, that sale will be subject to the license to the employer, and the purchaser of the patent cannot prevent the employer from continuing the use of the machine.

"If the invention is not a machine, but is an article of manufacture, as a tool in which the employer deals, then, in the circumstances supposed, the employer has a license to make and sell such tools without paying royalty, even after the patent is granted, and neither the inventor nor the purchaser of the patent can stop him from continuing to do so. In each case the employer's license continues over to any corporation into which the employer's business is converted.

"If the invention is a process, then the employer, or the corporation which continues his business, has a license to use that process without paying royalty, even after the patent is granted to the workman.

"In these cases, however, the license to make and sell the machine or the article and to operate the process is not exclusive—that is, it does not give the sole right to the employer; it only secures to him a right to the invention in connection with his particular business; and the inventor, or those to whom he sells the patent, can make, use and sell the invention, and license others to do so, without let or hindrance from the employer.

"As to persons employed to invent: If a person is employed by another to make inventions to be used in the employer's business, and is paid salary or wages on the understanding that his services are to be those of an inventor in improving the machines, tools or processes which relate to the employer's business, then the inventions which the employe makes relating to that business and the patents granted therefor are the exclusive property of the employer. In such cases the court says that the employe, in making and perfecting inventions, is merely doing what he was hired to do.

"Should the employe leave that employ, he cannot use, or make, or sell the invention, or convey any rights to others under it, except with the consent of the employer."

MINING SUMMARY.

ALASKA.

The superintendent's report of the Alaska-Treadwell G. M. Co., Douglas Island, is to hand for the year ending May 31st, 1900. It shows the earnings and expenses for the year as follows, averages based on 557,960 tons ore mined and milled:

	Total.	Per ton.
Bullion sold	$1,153,368	$2.0671
Store and miscellaneous profits	34,696	0.0622
Total receipts	$1,188,064	$2.1293
Mining ore	$ 278,194	$0.4986
Milling and concentrating	110,903	0.1988
Sulphuret expense	79,385	0.1423
Bullion charges	7,022	0.0126
Office and legal expenses	11,014	0.0197
Totals	$486,517	$0.8720
Less excess credit, general expenses	2,451	0.0044
Balance	$ 484,067	$0.8676
New construction	30,036	0.0538
Total costs	$514,103	$0.9214
Net working profit	$673,961	$1.2097

Details of the work done at the two mills are as follows:

	240-stamp.	300-stamp.
Total time run, days of 24 hours	312.40	270.24
Shoes worn out	500	600
Dies worn out	470	395
Stems broken and replaced	150	....
New cams put in	20	1
New cam shafts	6	....
Mortars broken	7	1
Ore crushed, tons	225,722	332,238
Sulphurets saved	3,898	5,927
Proportion of sulphurets to total ore	1.58	1.56
Ore crushed per stamp per day, tons	3.01	4.07

The 240-stamp mill was run 154 days by water power and 158 days by steam power. The 300-stamp mill started May 6th, 1899, and was hung up from Jan. 3d to March 21st, 1900.

Wages paid were as follows, the company providing in addition board and lodging for all workmen except Indian laborers: Machine drillers, $2.50 per day in summer, $3 in winter; machine helpers, $2.25; mine laborers (white), $2; amalgamators, $90 a month; feeders, $70; vannermen, $65 to $100; machinists and helpers, $2 to $6 per day; blacksmiths, $4; drill sharpeners, $3.50; blacksmiths' helpers, $2. Indian laborers receive $2 per day without board.

The report of Supt. J. P. Corbus says: "Exploration and development work for the year includes 1807 feet drives, 465 feet crosscuts, 1103 feet raises, 60 feet pump station and 20 feet sump, a total of 3455 feet. Of this 50 feet was on the adit level, 470 feet on the 110-foot, 1297 feet on the 220-foot, 1104 feet on the 330-foot, and 597 feet on the 440-foot. On the adit level a 50-foot crosscut was run, connecting No. 2 main shaft at surface with the adit tunnel, which greatly facilitates the transportation of ore from the shaft to the 240-stamp mill.

"On the 110-foot level No. 1 east drift was extended 137 feet to our end line, connecting with workings of 700-foot claim. An intermediate drift, 75 feet in length, was run above this No. 1 east drift, and 195 feet of raises were put in to connect with intermediate drift and also with No. 1 and No. 4 pits. Samples taken gave assay returns of $2.08 per ton. On the 220-foot level No. 6 east drift was run 177 feet, connecting with old No. 5 east, which has a connection with No. 1 shaft of 700-foot claim; 525 feet of intermediate drifts were run on this level, and 515 feet of upraises for chutes. Assay returns from samples taken along No. 6 east drift show that ore from this section of the mine carries very good values. A pump station, 12x15x40 feet, was cut, and a sump 10x10x20 feet deep was sunk for the Riedler pumping engine. On the 330-foot level the main crosscut was driven ahead 415 feet, and the face is now into the slate footwall a distance of 25 feet. This crosscut measures 442 feet from No. 2 main shaft to face, or 492 feet from end to end. On this level we find much the same condition of affairs as exists on the 440-foot level; the vein is about the same width as on the upper levels, but averages less, owing to the vein being mixed with slate and granite. There is a width of about 190 feet on this level that will pay to stope. The 330-foot level is connected to the 220-foot level by a raise along the footwall at the end of the main crosscut, measuring 125 feet. There is also an intermediate drift on this level measuring 95 feet in length, 120 feet of upraises for chutes and 349 feet of drives. On the 440-foot level development work during the year was 118 feet along No. 4 east and west drift, 301 feet along No. 5 east and west, 105 feet of upraises for ore chutes, and 73 feet of a 7x9-foot raise to connect with 330-foot level. The ore developed by this work proves to be of a payable grade. There was no sinking done during the year. It is proposed to resume sinking at No. 2 main shaft early during the coming year.

"Exclusive of pits, the approximate total development in mine May 15, 1900, is as follows: Drives, 7802 feet; crosscuts, 3260 feet; raises, 2629 feet; shafts, 778 feet; total, 14,469 feet. The location of the above is as follows: Adit level, 910 feet; 110-foot level, 4394 feet; 220-foot level, 6110 feet; 330-foot level, 1217 feet; 440-foot level, 1060 feet; No. 1 shaft, 272 feet; No. 2 shaft, 506 feet; total, 14,469 feet.

"The ore mined and sent to mill May 16, 1899, to May 15, 1900, was 557,960 tons. The estimate of ore in sight and available for mill May 15, 1900, is as follows: Adit and 110-foot levels, 1,514,408 tons; 220-foot level, 2,115,708 tons; 330-foot level, 226,849 tons; 440-foot level, 274,675 tons; total, 4,131,640 tons. On the 330 and 440 levels account is taken only of ore developed to the ends of drifts east and west. With each additional foot of drift run on these levels the ore reserves increase very largely.

"On May 12 a slide containing over 100,000 tons of quartz and slate came into No. 3 and No. 4 pits from footwall. This will not interfere with mining operations, and carries sufficient value to warrant milling entire quantity.

"The total run for the year at the 240-stamp mill was 312 days, 9 hours, 41 minutes, during which time 225,722 tons of ore were crushed, the duty per stamp per twenty-four hours being 3.01 tons, as against a run of 353 days, 2 hours, 50 minutes, and a duty of 2.95 tons per stamp for previous year. The large loss of running time at this mill was due to the following causes: Holidays, 2 days; shortage of battery water, 2 days; shortage of rock due to scarcity of laborers at mine, 42½ days; broken water wheel shafts, 1½ days; clean-ups, 2½ days; various other causes, such as repairs to batteries, changing from water power to steam power and vice versa, splicing ropes, etc., 2⅛ days; total loss of time for the year, 52⅝ days. On May 15th, after a run of over 15 years, this mill was closed down for extensive repairs, it being the intention to renew the ore bins, ore-bin foundations, battery foundation and battery framework throughout. No work will be done on the mill building, as that still remains in good condition. Timber for reconstruction work is Washington fir, and was purchased and framed at Seattle, Wash. To complete first section (forty stamps) will require until about July 15. Half of the mill should be finished and dropping on ore by August 15, and the full mill of 240 stamps should be running not later than October 1, 1900.

"An excellent record was made at the 300-stamp mill during last year, both as to running time and crushing capacity. The running time was 270 days, 5 hours, 45 minutes; the amount of ore crushed was 332,238 tons, or a duty of 4.07 tons per stamp per 24 hours. Last winter was an exceptionally short and mild one, consequently the water season for this mill was much longer than usual. Under ordinary conditions, I believe it will not be possible to run this mill by water power for more than 7½ months per year, or say the mill has a capacity of 285,000 tons per year.

"The total amount of ore crushed at both mills last year was 557,960 tons. The yield of sulphurets amounted to 9825 tons, all of which was shipped by barges and steamers to Tacoma for treatment by Tacoma Smelting Co. The total cost of shipping and treating sulphurets last year was $79,385, or $8.10 per ton. This high rate was due principally to the fact that parties who contracted to carry our concentrates in bulk from the mill to Tacoma failed to place at our disposal a sufficient number of barges to properly care for our product; consequently, we were forced at times to ship by other means at an increased rate of freight, besides having to stand the additional cost of sacking the sulphurets so shipped. Given proper shipping facilities, our sulphurets should be shipped in bulk and treated at a cost not to exceed $7 per ton."

Reports say that Koyokuk district is rich in some parts. An eight-ounce nugget was recently found on Emma creek. Gold from Ophir creek, Golovin Bay district, assays $18.26 to the ounce.

The tunnel of the Alaska G. M. Co. on the Darrow & Snyder, Berners Bay, near Juneau, is in 1100 feet.

The latest monthly report of the Alaska Treadwell mine, Douglas island, gives the result of a run of 300 stamps for 29½ days as 38,491 tons, yielding $51,660; 661 tons sulphurets are valued at $19,197; bullion product for month $76,006, ore averaging $1.97 per ton; expenses for month, $31,000.

The new 10-stamp mill of the Windham Bay G. M. Co., Juneau, W. Denby Supt., is completed. Stamps are 1000 pounds each.

ARIZONA.

GRAHAM COUNTY.

Suit is brought by J. Leszynsky against the Medler C. M. Co., the Morenci copper mines and C. A. Ross to recover title and possession to the Indiana and Medler mines, near Clifton, in the Copper Mountain mining district.

MOJAVE COUNTY.

The main shaft at the Occident, at White Hills, is down 700 feet. D. B. Murphy, engineer, is in charge.

PINAL COUNTY.

(Special Correspondence). — The Ray Copper Mines, Ltd., will shortly shut down. It is the intention of General Manager R. U. Turman to put in an up-to-date steam plant, using crude oil for fuel. They have at Kelvin a 300-ton concentration mill, which they will increase to 500 tons.

Kelvin, Oct. 29.

Supt. Parry of the Milwaukee, Florence, is pushing work.

YAVAPAI COUNTY.

The shaft on the Treasure Vault, near Prescott, is down 100 feet.

The Verde Queen, Jerome, smelter is in operation.

The Verde King Copper Co., capital $1,000,000, is incorporated to work property near Jerome.

CALIFORNIA.

AMADOR COUNTY.

The Lincoln, E. C. Voorheis Supt., Sutter Creek, employs thirty-five men. Shaft is down 1200 feet.

CALAVERAS COUNTY.

W. W. Cook and W. W. Weatherwax, of Campo Seco, are putting up a hoist and sinking a new two-compartment shaft at the Birdena, near there.

The stamp mill on the Lillie, Sandy gulch, Mokelumne Hill, will be put up on C. McCloud's mine, on Anderson Flat, Licking Fork, near there.

The vein at the Lew Wallace, near San Andreas, shows a width of 48 feet between well-defined walls. The rock is decomposed quartz and requires no blasting.

The Greek will soon resume.

Work at the Lucky Boy will soon start; U. J. Hussy, Supt.

The Shenandoah has a 10-stamp mill, rock breaker, etc. It will resume soon.

The mill at the Mountain Lion will start next week.

L. Sanguinetti is washing gravel near Vallecito.

The compressor and machinery at the Duchess will start this month.

The Osborne may resume under new management.

The Sheep Ranch M. Co., Murphys, is considering building an electric line to Sheep Ranch, 6 miles, and expects to run mine plant by electricity.

E. Huffman and J. Glassly are working the Virginia, at Wolf Hollow.

The Big Horn, on San Domingo, is showing up well.

Work at the Ozark is being pushed.

COLUSA COUNTY.

Oil has been struck at the Gorrill well, near Arbuckle.

EL DORADO COUNTY.

W. H. Husband, Supt. Gopher-Boulder, Kelsey, has men at work getting things in shape to resume.

The Gopher, Kelsey, will resume. The mill for the St. Clair will soon be in place and running.

The Larkin shaft, Placerville, is down 652 feet.

FRESNO COUNTY.

The Confidence Oil Co., at Coalinga, will soon be pumping well No. 1, which is down 800 feet.

The Blue Goose Oil Co., at Fresno, is pumping water from its well, struck at the 2000-foot mark.

The Venus Oil Co., Fresno, is still drilling.

HUMBOLDT COUNTY.

Near Petrolia, at McNutt Gulch, oil has been struck at depth of 1700 feet; yield, about ten barrels per day.

KERN COUNTY.

The Cantua, Bakersfield, is down a little over 1000 feet and expects to strike oil at between 1200 and 1500 feet.

E. C. Johnson has sold to the Fairview M. Co. interest in the Fairview mining claim for $20,000.

The Kern Canyon, Bakersfield, drilling on east line of 25, 28, 27, dropped into a pocket of gas that carried up a stream of oil and sand nearly to top of derrick and continued storming for half an hour. After sand had ceased blowing, gas discharged all night and into next day.

The Great I Am mine is leased to Lacon & Short. Of every $100 worth of rock or ore placed on the dump, the owner is to receive 65% of the proceeds, but must haul the water and ore, furnish timber and reduce the ore.

T. N. Stebbins is putting up a new stamp mill on the O Be Joyful, Tuba canyon, Randsburg.

The Red Dog mill, at Randsburg, Manager Griffiths, is to be in continuous operation.

MARIPOSA COUNTY.

Work at the Virginia, Mariposa, has resumed. A recent strike of ore in the Pumpkin Hill, Coulterville, is said to run $100 to ton; vein 3 feet thick. A new stamp mill goes in on the Yankee Jim, near Bagley.

MADERA COUNTY.

(Special Correspondence).—The Standard Co. is working the Independence mine and have a body of ore. Their mill is running constantly.

The Mud Springs mill is running. The ore bins are full and there is a large daily output from the stopes of the 400-foot level.

The Waterloo is running five of its ten stamps and work is actively prosecuted in the mine.

The new mill of the Magnet Co. is ready to run. The ore is carried from the tunnel to the mill, 500 feet, by a three-truck tramway.

Gold, Oct. 30. W. F. ARAM.

NEVADA COUNTY.

The population of Grass Valley is 4719, of Nevada City 3250.

E. Tilley, on the Midnight, near Nevada City, has opened up a body of ore 125 feet from surface; ledge 2 feet wide.

Union: E. Tilley, Supt. Tilley mine, will erect new machinery on the property.

The case of Langdon vs. the Mountaineer M. Co., in the U. S. Court at San Francisco, has been compromised.

PLACER COUNTY.

G. T. Miller, owner and Supt. Last Camp (hydraulic), Blue Canyon, is repairing ditch, etc., preparatory to starting up.

The Blue Canyon M. & D. Co.'s tunnel is in 2700 feet.

Work on bedrock tunnel, on American river, has been suspended for the winter.

It is locally reported that the Westinghouse Electric Co. is considering the project of putting in an electric plant to furnish power for mines in Humbug canyon, near Colfax.

The tunnel at the Mayflower, near Forest Hill, now in over 1500 feet, will probably be continued another 500 feet.

The Hidden Treasure, near Colfax, produces about 250 carloads blue gravel daily from a channel 250 feet wide.

RIVERSIDE COUNTY.

The Riverside-Fullerton Oil Co., Riverside, is putting in new machinery near there. Drilling is resumed.

The Desert Oil Co., Indio, has begun operations near there.

SAN BERNARDINO COUNTY.

The Edna mine, southeast of Randsburg, is sold by H. T. Duff to the Edna M. & M. Co., for $36,000.

Work at the Gold Mountain, near Bear Valley Lake, is being pushed.

At Gold mountain there are seventy-five men employed in the mine and mill; the latter is in continuous operation. The mine is worked by one shift; all the ore is taken out that can be handled by the mill. J. D. Spargo is Supt. The forty stamps have a capacity of three and one-half tons each—a total of 140 tons—running $5 a ton. It is expected that the mill will be increased to 100 stamps. There are 189 people in the camp.

SAN DIEGO COUNTY.

The stamp mill at the Escondido mines is running day and night.

SANTA BARBARA COUNTY.

Drilling on the Sycamore canyon oil well, near Santa Barbara, is resumed.

SHASTA COUNTY.

Keswick reports that the strike at Iron Mountain is declared off by the miners, some of whom are now willing to return to work at the old wage scale and hours. The strike did not affect the operation of the smelter.

Several carloads steel rails for narrow-gauge railroad from Bully Hill to Pit river, now being built by De Lamar's Bully Hill mines, recently arrived in Bella Vista. Work is being pushed.

C. J. Hammond of Oakland has bonded his Crown Point mine, Igo district, to A. J. Wright for twelve months.

The King copper group, Flat creek district, near Redding, is reported sold to D. C. Galvin for $10,000.

H. A. Cohen, general manager De Lamar properties, Redding, expects to have smelters and converter running before Jan. 1st.

The Golden Jubilee M. Co., Redding, will put in an upright boiler.

SIERRA COUNTY.

Ore has been struck in the Osceola, near Alleghany.

J. Byrne has leased the Morgan, near Grizzly Peak, Downieville.

The Keystone, Sierra City, is getting in gasoline, sixteen tanks having arrived recently.

The Illinois, near Kingston, will resume, after lying idle for fifteen years.

Tunneling is in progress on the Argentine, near Alleghany.

Six men are working at the York.

The Mineral Mountain M. Co., under the laws of Colorado, capital stock $1,000,000, will operate the Frost mine near Downieville. Directors: E. R. Rabb, J. T. Robinson, A. H. Pipenberg, C. Stanley, R. B. Myers, W. O. Frost, J. L. White.

SISKIYOU COUNTY.

J. O. Welch will erect a stamp mill on his gravel mine near Gazelle.

A 40-stamp mill is projected on the Sterling, near Coles, next spring, in place of 10-stamp mill now in use there.

The La Flesh and Jillson & Co. mines, near Yreka, are running day and night.

The Greenhorn No. 2 (blue gravel) has suspended temporarily owing to breakage of pump cable. Repairs are under way and operations may soon resume.

The Dewey, near Gazelle, has stopped shipping to Keswick, as company intends to put up 20-stamp mill and do its own crushing.

Mr. Welch is erecting an 8-stamp mill on his gravel and quartz claim near Gazelle.

A. C. Brokaw is working the old R. H. Campbell, Quartz valley.

TRINITY COUNTY.

C. D. Galvin of Weaverville has his dredger for use on Weaver creek about finished.

The Union Con. M. Co., capital $50,000, is organized to work 240 acres patented land near Abrams.

The mill at the Yellow Rise is running steadily. Operations will continue during the winter.

The mill at the Loftus is completed and running.

It is reported that the Knownothing, on South Fork of Salmon river, has closed permanently, vein being exhausted. Machinery has been taken out and is announced for sale.

The Trinity Copper Co. has incorporated in New Jersey, capital $6,000,000, to take over the Shasta King property and revive it as a copper mine.

TULARE COUNTY.

Work at the Minnie-Ellen mine, Porterville, is progressing. The shaft, present depth 115 feet, will be sunk an additional 100 feet.

TUOLUMNE COUNTY.

After a shut down of sixty days many of the quartz mills on the mother lode in Tuolumne county resume operations. The Tuolumne Water Co. turned water into its main ditch Oct. 31st; the Phœnix lake power plant is furnishing electric power to several mines.

The new mill at the Clio, near Jacksonville, is running on ore from a new shoot. Steam power is being used, water not being available.

The 20-stamp mill at the App is running and additions to the 60-stamp mill will soon be completed.

Near Jacksonville, at the Williette mechanics are repairing the old mill. J. Gleason is Supt.

S. S. Bradford of Sonora is getting in lumber at the Riverside, near Columbia, for the rebuilding of the mill, etc.

The machinery and other improvements being put on the Starr King, Carters, will be ready Nov. 10th.

Work on the New Year, an extension of the Providence, near Carters, has resumed.

The Golden Gate M. Co., J. Fischer president, will enlarge their chlorination plant and add twenty stamps to the twenty now running, making a total of forty stamps.

A. A. Harris will work his gravel claim near Matelot.

The Mazeppa will be unwatered.

Independent: Water is turned into the ditch to start up the 20-stamp mill at the App mine. Progress is being made on the new addition to the mill of sixty stamps.

New Era: The Little Laurel, Carters, has closed down for repairs.

After two months' shutdown, the quartz mill on the Mother Lode, near Jamestown, has resumed.

Mine managers report a scarcity of miners in the district.

YUBA COUNTY.

Campbell & Martin, opening the Stiles, Nevada City, are laying a mile of pipe, connecting with Summit M. Co.'s pipe, near Town Talk.

At the Golden Trout, 6 miles west of Strawberry Valley, men are erecting a 40-stamp mill.

The Good Hope, near Cabbage Patch, is bonded to R. Vincent of Grass Valley. He will erect a mill and expects to have men at work soon.

COLORADO.

BOULDER COUNTY.

The Haywood (coal), near Lafayette, E. Scholes, Supt., is being put in shape to resume. Forty men will be employed.

The Grand Junction Coal M. Co. is sinking near Lafayette. At 116 feet, a 10-foot vein opened up, supposed to be an extension of the Louisville vein. Hoisting will begin and more men put on.

The Midget mill is making a test run on wolfram ore from the mines of G. Wanamaker. They have twelve tons of concentrates that go 60% tungstic acid.

The St. Louis M. Co. of Caribou have bought the McMaster mill at Moon gulch, Rollinsville, and will remove building and machinery to Caribou. H. Wohlke has charge.

E. Welzer, Supt. North Pole mine, says development work is being pushed. Fifty men are employed. A Hallidie tramway is being constructed from the mine to the mill, 7750 feet, to be completed next spring.

CHAFFE COUNTY.

Should new smelter at the Tasmania, Winfield, prove a success, it will be enlarged.

Ore from the Atlantic, Winfield, a sulphuret, runs high in gold.

Pres. Erisman, of Practical G. M., M. & T. Co., will work ten men on Independence group, Winfield, this winter. The erection of a concentrator is contemplated.

The Little Annie, in Freshwater district, 6 miles from Buenavista, has resumed. The mine has a Huntington mill in place and work will be pushed.

CLEAR CREEK COUNTY.

Driving of the Newhouse tunnel, Idaho Springs, is progressing.

The Jackson and Newton mills, Idaho Springs, are working day and night.

The Mixell 20-stamp mill, Idaho Springs, is running constantly.

At the Anderson, Idaho Springs, the 10-stamp mill and two crushers are in operation. Ore averages $12 per ton, while smelting product runs about $100 to the ton.

Eighty tons of ore from the Fraction, on Spring creek, near Idaho Springs, produced seventeen ounces of gold and a carload of concentrates worth $50 per ton.

The new mill of the Senator & Blue Ridge Co., Idaho Springs, is running and work is being pushed.

The Inverness, Yankee, R. Burns, owner, has resumed.

More men will be put on at the Ohio.

The Manhattan shaft will be sunk.

It is reported that men are scarce in Yankee camp.

It is reported that active operations will be carried on near Empire this winter.

The Empress has put in new 80 H. P. boiler and larger compressor.

The Pioneer, operated several years ago by late D. J. Ball, will probably resume.

EL PASO COUNTY.

The largest chlorination mill planned in Colorado is to be built by the Portland M. Co. of Victor at Colorado City. There will be three 60-foot furnaces, twelve chlorination barrels, rolls 18x42 inches, with eight sets of driers, and necessary screenings.

GILPIN COUNTY.

Bruhl, Cody & Co. are working the Flynn Mammoth, near Central City. Two shafts are working at the West Notaway. Sinking is progressing at the Good Luck; shaft is down 125 feet. The shaft of the Argosy, present depth 283 feet, will be sunk an additional 35 feet. The Cook is working 140 men.

The Perigo, Perigo, employs fifty men. Two shifts are working at the Gold Dirt, J. Bowden Supt. The Wizard M. Co. will drive a 300-foot tunnel on War Eagle hill.

H. E. Eastman is pushing work on the O'Neil, on Gregory hill.

GRAND COUNTY.

(Special Correspondence).—The Touraine placers, which were sold to Boston parties through the efforts of H. H. Daniels of Denver, are to be equipped with flume and hydraulic apparatus, and it is expected the property will be operated next season. These placers are on Willow creek, a tributary of the Grand river. The holdings of this concern comprise about 500 acres, which includes the Gold Run placers, along same creek, on which there is now a hydraulic plant.

Another Boston company is putting in a ditch for placer work on Willow creek, 12 miles above the Touraine, and a Denver concern is doing similar work in same locality, preparing for business next season.

Some work on the gilsonite beds at the head of Willow creek is in progress.

This locality is usually reached by wagon, stage or horseback from Georgetown, over Berthoud pass and via Sulphur Springs, the distance from Georgetown being about 60 miles.

Sulphur Springs, Oct. 20.

GUNNISON COUNTY.

Three shifts are driving the big tunnel at the Silver Basin, near Pitkin. The compressor and drills will soon be at work.

Ogden & Scott of Aspen have leased the Black Queen and Fargo and will put in new hoist and other machinery during the winter.

Shaft on the Chloride, Pitkin, is down 192 feet. Crosscutting on this level shows vein to be about 3 feet wide with 6-inch paystreak.

Pitkin Miner: In the Sacramento, Pitkin, work is continued in crosscut.——On the Reynolds group, on West mountain, water pipe line has been completed; compressor is being set up; two shifts are employed; three will be put on shortly.——On the Big Seven diamond drill has been driven over 200 feet below the bottom of shaft, making total depth 400 feet. Management will go down a few hundred feet further.——The Mackenzie shaft No. 2 has reached depth of 70 feet, at which point water has become so strong that management will place an entirely new plant, including pumping machinery, on property. Manager Lejune expects to have new plant in operation next month.

HINSDALE COUNTY.

Tunneling is progressing on the Vermont group, near Lake City. Machine drills are used.

It is reported that the Czar Co., Capital City, will put in a mill on the Czar next year.

Denver Republican: The San Cristobal M. & M. Co. will put in a large water power plant at Lake City, having capacity for generating 500 H. P.

HUERFANO COUNUY.

The Stone-Ripley, Grayback district, near Walsenburg, is sold to Eastern men for $60,000. The new management contemplates developing and will put on fifty men.

There are thirty placer mines in operation near the towns of Placer and Russell.

LAKE COUNTY.

(Special Correspondence).—The representative of the Vieille Montague Co., a zinc smelting concern of Belgium, has been in Leadville for the purpose of obtaining information as to the grade and quantity of zinc ores in this district, it being given out that this company may erect a zinc reduction plant at some point in the United States.

Leadville, Oct. 29.

The A. M. W. Co. has built a large mill in Big Stray Horse gulch, Leadville, to treat its low grades at the rate of 100 tons per day.

In Taylor Park, Leadville, the Enterprise has forty men working; the Star has thirty-seven, and expects to put on more as development permits. The Forest Hill has nine men crosscutting, and will probably add more.

S. L. Fox, manager Philadelphia M. Co., has leased 860 acres of land near Turret from the Colorado Iron & Fuel Co., and will begin development.

At the Rubie, on Iron hill, Leadville, ore body has been developed along strike for 15 feet on 707-foot level, and shows no signs of giving out. A pump will probably be put in to keep shaft clear of water.

At Leadville the shaft on the Rose Emmet is down 525 feet.

Supt. Connors is pushing work on the Canterbury shaft, Leadville.

Sinking is in progress on the Fanny Rawlings.

A larger boiler is being put in on the Little Bob; G. F. Campion, manager.

A new engine and boiler room are being built at the Hummer.

LARIMER COUNTY.

It is reported that a strike of copper-gold ore has been made on shore of Island lake, near Owl.

MINERAL COUNTY.

Roe & Lamb are working two shifts on the United Mines, near Creede. They intend to put on additional men soon.

At the Judson tunnel, Spar, miners report a strike resembling sulphurets; also one of crystallized lime.

Work on the Hidden Treasure, at Sunnyside, is suspended.

C. H. Abbott is pushing work on the Holy Moses, Solomon and the Ethel, Creede.

PARK COUNTY.

The Andesite Gold M. & Town Co., of Colorado Springs, is incorporated to work property near Guffey. E. G. Morath, general manager.

SAGUACHE COUNTY.

After lying idle for ten years the Stem Winder, Bonanza, has resumed.

SAN JUAN COUNTY.

At Silverton, the Kendrick-Gelder smelter is sampling ore from Notaway M. Co.'s Champion No. 2.

Seven tons gold-silver-lead ore shipped to Durango recently from the Diamond Cunningham gulch netted $30 per ton.

Recent carload ore from the Queen City, Ohio gulch, gave returns of $205.75 silver, 28.20% lead and 7.04% copper.

The new compressor at the Iowa, Arrastra gulch, will soon run.

Additions to the Gold King's mill are completed; forty stamps were added, besides tables, jigs, etc.

The Emma tunnel, now in 828 feet, will be driven several hundred feet farther.

Work on the Sunsite, Ice Lake basin, is being pushed.

In 178-foot tunnel on the Mazeppa, Twin Sister's mountain, body of galena was opened up recently, carrying high percentage of lead, besides gold and silver values.

SUMMIT COUNTY.

The Rapidan G. M. & M. Co., Patterson manager, has bought the Cœur d'Alene, on Academy hill, Black Hawk, and is getting it in shape for regular shipments. After rearranging steam pump in main shaft, and replacing worthless water pipe with new pipe, the lower workings will be unwatered and sinking resumed. Ore from bottom of shaft yielded five ounces gold per cord, while that from the lower west level gave returns of over seven ounces gold per cord.

At the Little Elkhorn, on Little mountain, two tunnels are being driven on the vein. The upper is in about 40 feet and the lower is in 100 feet. Conrad & Foot are the operators.

The Gold Pan M. Co. has suspended work for the season. Two drills, however, will be kept at work prospecting in Blue river valley until very cold weather sets in. An elevated track is being put in and work at the machine shop is progressing favorably.

The Blue river excavators (Lambing pattern) are reported a success.

TELLER COUNTY.

The Juniata Co. has received patent for its Silver Bell claim, Cripple Creek. Considerable development work will be done, now that title is assured.

The Hattie W., consisting of five claims on Squaw mountain, Cripple Creek, has been bought by the New Century Co. for 225,000 shares treasury stock.

At Victor block No. 3 of the Christmas is leased to E. Sharpe, who will resume operations.

The Johanna will resume next month.

The new hoist at the Legal Tender will be put in next month.

Sinking on the Atlanta, Cripple Creek, is in progress.

The Atlantis Mines Corporation is setting timbers in the new station on the 550-foot level.

The shaft on the Florence, on Bull hill, Victor, has a depth of 320 feet. At that depth crosscutting was started.

Shipments from the Sacramento, Victor, average fifty tons a month, mainly of screenings, worth $40 per ton. A compressor will be put in.

The Arno G. M. Co., operating in the heart of Anaconda, Cripple Creek, will put in a steam plant near there.

The compressor being put in on the John A. Logan, Victor, will drive twenty-five drills.

Work on the Gold Bug, Olive Branch Co., near Cameron, Cripple Creek, is resumed.

A patent has been issued to the Free Gold M. Co. for the Northeastern lode, on Squaw mountain, Cripple Creek, consisting of seven and three-quarter acres.

Work at the Elkton, Cripple Creek, is progressing. At the 700-foot level the ore body is 5½ feet thick. The new pump, capacity 1000 gallons per minute, is running and the new hoist will soon be started up.

At Cripple Creek the shaft of the Wide Awake is being timbered as sinking progresses.

Drifting is in progress on the 500-foot level at the Jennie Sample. One shift is working. The new 6-drill compressor is in.

W. A. Ramsay of Colorado Springs has bought an interest in the Lucky Thought for $2000.

A 12-drill compressor will be placed on the Rubie and a 15-drill compressor will be added to equipment of Hull City placer Co.

Miners at the Independence, Victor, have quit work owing to personal search plan put in operation by the company.

It is announced that the shaft at the Lillie, Victor, will go down 300 feet more.

Development is progressing at the Unexpected. Shaft is down 60 feet.

The plant on the old Eclipse shaft of the

New Haven Co., Cripple Creek, has been moved to new workings on same property.

The Amanda Co. is sinking.

Drifting on the 120-foot level is in progress on the Twin Sisters. A steam plant and hoist have been put in. Steam drills will soon be running.

The Golden Cycle, Cripple Creek, has resumed.

J. Barbee is crosscutting on the Cripple Creek, Columbia.

All work at the Lillie, except sinking for 1500-foot station, has been suspended.

The Clyde shaft, Cripple Creek, is down 675 feet, and will be sunk to 800-foot level. New pump, 150 gallons per minute, is running. Diamond drills will soon be running.

The Illk Co., Victor, will put new plant on its Mineral Hill property.

Crosscutting is now in progress on 150-foot level at the Abe Lincoln.

Shaft at the Anaconda is down 400 feet.

The Chicago & International Dev. Co. are drifting on 135-foot level at the Draper, Victor.

The Marie M. Co., Cripple Creek, will put in another air compressor, capable of driving three ¾ drills; present one drives six small drills. Shaft will be sunk 300 feet additional, making total depth of 885 feet.

The new sampling plant of the Cripple Creek Sampling & Ore Co. will be finished Dec. 15th. It will be the largest in the State. The crushers will have jaws 15x24, with estimated capacity of twenty-five tons per hour, and rolls, of which there are two sets, have capacity of fifteen tons per hour each. Bin capacity, 2500 tons. The plant will be run by electricity.

It is reported that the Clyde, Cripple Creek, has closed down; also, that Supt. De Masters has resigned.

It is reported that shafts on the American Eagle and the John A. Logan will be sunk to depths of from 2000 to 3000 feet. The greatest depth in the vicinity at present is 1200 feet on the John A. Logan.

IDAHO.

OWYHEE COUNTY.

The Wagener arrastra is working ore from the Steuben, Silver City.

Hedum, Bishop & Stevens have completed air pipe in the Addie and are stoping.

Williams, Eisenhart, Reel & Fleming have an eighteen months' lease on the South Central and are pushing development.

SHOSHONE COUNTY.

On Oct. 26th a defective light wire at No. 4 tunnel on the Mammoth, Wallace, set fire to drier and exploded 7000 pounds dynamite, resulting in loss of $4000.

The Victor M. & D. Co. has incorporated at Murray; capital, $100,000.

The Standard M. Co., Wallace, is putting in new settling tanks on lower side of concentrator to make a closer saving in slimes. It is one of the most complete slime plants in the Cœur d'Alenes.

Work on the Wonderful group, near Wallace, will be continued during the winter.

A new plant is to be put in on the Amador, near Wallace. It will include a 16-drill compound 22x26 belt-driven air compressor and new hoist, to be operated by compressed air. The plant will be driven by water power, a head of 211 feet being available at that point. It is expected to run by Dec. 1st.

The Stevens Peak M. Co., near Mullan, will not ship ore until next spring. The tunnel, now in 750 feet, will be driven during winter.

WASHINGTON COUNTY.

The Blue Jacket mine has suspended operations at Cuprum.

MISSOURI.

Joplin zinc men anticipate advance in price of ore. Managers of zinc properties are not anxious to dispose of their ore at the present price—$28.50 a ton—and are storing their output in bins. The reason for the expected advance is the strength in the metal market. Spelter is now quoted in the St. Louis market at $4.10 to $4.15. The demand is active, and, on account of it, there is a good inquiry for ore.

WRIGHT COUNTY.

The Dodson Co. of Bethlehem, Pa., who have complete concentrating plant near Mansfield, expect to resume. Lead Hill, it is said, has shipped over 400,000 pounds free lead.

MONTANA.

CASCADE COUNTY.

The Boston & Montana Co. of Butte may use Rainbow Falls to run its smelter at Great Falls. It will enlarge its electrolytic plant; 4,000,000 pounds refined copper are shipped monthly from Great Falls.

JEFFERSON COUNTY.

The Lee Mountain, near Basin, may be opened up soon. W. Tatham of Philadelphia is one of the owners. The mine has a vein of silver-lead concentrating ore 80 feet wide between walls, with bodies of high-grade ore, and is developed to a depth of 700 feet by system of tunels and raises.

MADISON COUNTY.

A new mill is projected on the Leviathan, near Mammoth, next season.

J. Carter and P. Vinyard are working the Klondike Lode, at head of Boulder basin.

SILVER BOW COUNTY.

The Peck experimental plant at the old Centennial mill, Butte, for treating low-grade ores of that district, is a failure, and it is said that the machinery will be sold.

The Anaconda, Butte, will probably resume latter part of this month. Average monthly output for last five years has been 10,000,000 pounds. Production in 1897 averaged 11,000,000 pounds per month. At the Parrott work is progressing. It is expected new plant will be completed and running by Jan. 1st, when force will probably be put on.

NEVADA.

CHURCHILL COUNTY.

Report that the Bellmare group had been sold to a Colorado company for $300,000 is denied by Vice-President Somer of the Bellmare Co.

ESMERALDA COUNTY.

The Silver Peak mines, Hawthorne, are reported sold to the Silver Peak G. & S. M. Co. of New York; consideration $600,000—$100,000 cash and balance secured by mortgage.

EUREKA COUNTY.

O. J. Smith has refused receivership of the Whalen Con. C. M. Co.'s properties at Alpha. Mr. Whalen proposes to resume work on the properties.

The Eureka Con. mine has resumed. Thirty-five men are at work.

LINCOLN COUNTY.

The greatest depth reached in the Searchlight mines is 300 feet.

A strike of rich ore is reported on the seventh level of the De Lamar mine. Three tons assorted from the discovery averaged $1200 per ton in gold.

The New Era M. Co. is incorporated to operate in the Searchlight district.

STOREY COUNTY.

With the advent of electric power at the Comstock the outlook is promising. The Nevada mill at the Chollar and several others will probably be started up in the near future, and increased forces put to work.

The main south drift from the Gould & Curry tunnel, Virginia City, is in on the 425-foot level 172 feet. The face is in vein porphyry, with small seams of low-grade quartz through it.

At Virginia, work on 2150-foot level at the Con. California & Virginia will soon resume. In the Sutro tunnel, on 1700-foot level of the Ophir, nature of ground requires timbering. Tunnel at the Hale & Norcross is in over 1840 feet. Shaft at the Sierra Nevada is being timbered.

WASHOE COUNTY.

Nine men are working on the Reno Star, Reno.

Clark & Curry are driving a 1000-foot tunnel on the Peavine, Reno.

Fourteen men are employed at the Cold Springs, Reno, and the force may be increased.

Ore from the Cabin No. 2, Reno, is being put through the Slip mill. It runs $80 to the ton.

It is said that 100 men are now employed in mining in vicinity of Reno. It is reported that Donduro, Rosasco & Dellipiaza recently cleaned up nearly $1700 from a seventy-ton run at the Proctor & Slip mills, Wadsworth. Two shafts are being sunk on the Piute to tap lead running through Cabin No. 2. The Washeim mill in White Horse canyon is running; capacity about eight tons per day.

NEW MEXICO.

COLFAX COUNTY.

The Gold & Copper Deep Tunnel M. & M. Co., Elizabethtown, is incorporated; capital $200,000. Work on the Free Gold and the Emerald is progressing.

GRANT COUNTY.

It is reported that damage by fire at the Philadelphia, at Hanover, was not as great as first thought; estimated loss now, only $500 or $600. Plant will be repaired and operations resumed about Jan. 1st.

SANTA FE COUNTY.

The smelter of the Santa Fe G. & C. M. Co. at San Pedro will be started up Nov. 15th.

Work on the Old Rusty, near Golden, Pigeon gulch, is being pushed.

The Gold King is being developed by a 100-foot tunnel. Vein is said to be 40 feet wide and that ore assays from $7 to $40 per ton.

In the Mace Maceo, ner Cerrillos, in 90-foot drift, a 20-foot ledge has been opened up, showing gold, silver and copper values.

SIERRA COUNTY.

A concentrating plant of 100 tons daily capacity will be erected on the El Dorado group, near Hillsboro, Neil & Buchanan owners.

H. Steele has an extension of bond on the Price and Patrick claims, Hillsboro, and will push development. Sixteen men are at work.

The Torpedo, in the Organs, near Hillsboro, has resumed.

SOCORRO COUNTY.

Development at the Graphic, near Kelly, is progressing.

Machinery at the Cavern, Magdalena, Manager J. Stephenson, will soon be placed.

TAOS COUNTY.

The Strawberry, Tres Piedras, R. Cole Supt., has five men sinking and drifting. A 4-foot vein of copper-gold ore runs about $48 to the ton. The mine is well equipped, having 40 H. P. boiler, steam hoist, good buildings, etc. The group of claims in Cunningham gulch, Tres Piedras, is reported sold to the Mexican King G. & C. Co. of Milwaukee, Wis.

J. M. Moad is working the Bitter Creek (placer), near Red river.

Supt. G. B. Paxton has put on more men at the Red River copper mine, near Red river.

OREGON.

BAKER COUNTY.

The Cracker Summit G. M. Co. of Spokane, Wash., is incorporated, capital $250,000, to work property in the Cracker Creek district; general manager, H. W. B. Smith. Two shifts will be put on and development continued during the winter.

After ten days' run of 10-stamp mill at the Gold Ridge, Baker City, $800 worth of amalgam was scraped from plates.

A 4-foot vein of cobalt is locally reported as having been recently opened up on property of the Standard M. Co., on Dixie creek, near Baker City.

The Gold Bug Grizzly Co., Baker City, will sink shaft to 500 level.

The Bald Mt. M. Co., Manager M. Callum, is putting in a 20-stamp mill and electric light plant at the Bald Mountain, Sumpter.

A 5-foot Bryan mill is being put in on the Belle of Baker, Baker City.

GRANT COUNTY.

At Granite the tunnel at the South Cougar is in 120 feet.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Repairs on the De Smet mill, Deadwood, are completed and it will run on De Smet and Deadwood–Terra ores.

The Mayflower is bonded, and if sampling now being made is satisfactory it will be reopened.

The new Cleopatra mill has a capacity of 100 tons for amalgamation and 50 tons for cyaniding.

A new shaft will be started on the Homestake.

The Portland cyanide plant is running.

Work on the Lena, Manager Haskell, will be pushed.

The Shawmut G. M. Co. of Deadwood reports earnings for the twenty-seven days ended Oct. 16th of $2241. This is an improvement of more than 50%.

UTAH.

GRAND COUNTY.

The Davis–Thompson stamp mill, near Moab, will begin this month.

JUAB COUNTY.

Manager Geddes of the Swansea, Silver City, is sinking. At 970 feet carbonates were opened up.

A new mill for the May Day, Eureka, is expected to be up early next year.

SALT LAKE COUNTY.

The Dewey mill, Bingham, has resumed.

The Chloride Point cyanide plant, on Lion Hill, Salt Lake, will close down for the winter. Outside work will continue.

It is reported that the Centennial-Eureka and the Eureka Hill companies, Tintic, have an agreement by which the latter's mill will be used in treating former's ores.

SUMMIT COUNTY.

H. G. Milland, of Salt Lake City, has secured controlling interest in the Crescent Hill M. Co., Park City. Active development is contemplated.

At Park City, the California M. Co. is incorporated, capital $75,000, to work the California, Independence, White Rock and other claims near there. The Anchor has resumed. The new aerial tramway for the Silver King is well under way. The new smelter for the Valeo will be running this month.

J. A. Kirby, Supt. Daly–West, at Park City, is making connection with main chute on 1200-foot level.

TOOELE COUNTY.

The new 1800-foot steam line at the Honerine, near Stockton, will be completed this month. Upon completion sinking will be resumed.

WASHINGTON.

FERRY COUNTY.

G. L. Hedges, Supt. Wanconda, near Republic, has men timbering 400-foot tunnel, now in 160 feet. Sinking will be done on the Clackamas.

It is reported that the Mountain Lion and the Tom Thumb, Republic, will be consolidated and controlled by British and Canadian men.

Preliminary tests of the new Republic mill, Republic, show a saving of 93% from $25 ore.

C. T. Porter, Supt. Golden Lion and Little Four Con. G. M. Co., Republic, has men at work sinking a new shaft to be 4x6 feet in the clear, and to be sunk 500 feet.

Recently five samples of ore from the Hawkeye, Republic, gave respective assays of $33.18, $33.45, $33.58, $45.92 and $64.42 per ton.

The Flag Hill, near Republic, is showing up well. Driving and crosscutting are under way.

Net returns from first shipment of twelve tons from the Morning Glory to Granby, B. C., smelter were $1312.61, or about $109.50 per ton.

OKANOGAN COUNTY.

Palmer Mountain tunnel, Loomis, is in 3800 feet. The Northland Gold & Copper M. Co. will continue operations during winter. The Bridgeport M. & M. Co. will resume operations on Mineral hill. The Golden Zone will run a 500-foot tunnel; extra machinery is being put in mill.

SKAGIT COUNTY.

At Anacortes the Eureka stamp mill is crushing forty tons ore per day.

Sinking is in progress on the Ninety-six. Work will continue during the winter.

The tunnel at the Mammoth is in 700 feet.

THURSTON COUNTY.

Coal discovered at Grandmound is reported over 6 feet thick, and resembling anthracite.

WHITMAN COUNTY.

In the Hoodoo district, near Palouse, the wagon road from the Grizzle to the Mascot, 12 miles, will be finished by January 1.

WYOMING.

CARBON COUNTY.

The Boston & Wyoming Smelting Co. is reported organized to erect a smelter at Grand Encampment to treat ores from the Kurtz–Chatterton (copper) near there.

CROOK COUNTY.

It is reported that a strike has been made at the mines near Welcome. Ore is phonolitic, and assays are said to go from $5000 to $10,000 to the ton. A. D. Ticknor is owner.

FREMONT COUNTY.

Dexter G. M. Co. is incorporated, capital $1,000,000, to work placers near South Pass.

Gravel from the Granier (placer), near South Pass, has run 75 cents and $1 to the pan.

W. H. Baker of Denver, Colo., will probably work the Tabor Grand, South Pass.

The Garfield, South Pass, C. E. Ross manager, is being put in shape for winter work.

Owners of the Queen of the Hills, South Pass, are timbering old shaft and will sink farther.

FOREIGN.

BRITISH COLUMBIA.

The Dunsmuir Wellington mines have closed down, coal having given out. With exception of Esquimalt and Nanaimo workshops, which will be removed next year to Ladysmith, the little mining town established over thirty years ago is deserted.

At the Buckhorn, Greenwood, a crosscut to tap the ledge at 400 feet is being run. Ore is copper-gold.

The None Such group, Smith's camp, Greenwood, will resume this month.

The tunnel on the Crystal Butte, Myers Creek district, is in over 600 feet.

The Standard Pyritic Smelting Co., Greenwood, expect to have their new smelter running by Jan. 1st.

The Old Gold Co., Lardeau, Supt. Westfall, will continue operations during the winter.

Sinking on the Earthquake, Grand Forks, will be continued to the 200-foot level.

Ten men are working at the Estella.

E. W. Beckel, recorder Atlin district, estimates that 400 men will remain in Atlin this winter to work bench claims.

Personal.

J. H. Hammond is in Denver, Colo.

Henry Bratnober is in Butte, Montana.

I. Copeland of Downieville, Cal., is in San Francisco.

H. Wilson of the Chloride, Dedrick, Cal., is in San Francisco.

Menno Unzicker, of Spokane, Wash., is visiting Rossland, B. C.

F. Klepetko has returned from Salt Lake City to Butte, Mont.

F. Snell of the Champion, Maybert, Cal., is in Grass Valley, Cal.

F. S. Roumage has returned to Auburn, Cal., from British Columbia.

W. F. De Camp, Supt. of the Lillie, Goldfield, Colo., has resigned.

E. Luketich of Hermosillo, Sonora, Mexico, has returned from Europe.

F. M. Leland of Risdon Iron Works, San Francisco, is in Baker City, Or.

G. M. Pinney, Supt. Mountain mine, Sierra Co., Cal., is in San Francisco.

E. Boyce, Pres. Western Federation of Mine Workers, is in Baker City, Or.

C. W. Irish, of Coleman Placer M. Co., Gold Creek, Cal., has gone to Chicago.

C. Widmeyer of Bonanza, Colo., has returned there from Durango, Mexico.

T. A. Pearce of Philadelphia, of Black Warrior Copper Co., is in Globe, Ariz.

C. Jacobs, foreman App Con. Co., Jamestown, Cal., is in San Jose, Cal.

Victor M. Clement is examining mining property in Owyhee Co., Idaho.

J. E. Ericson, Supt. Rustler Gulch M. Co., Crested Butte, has gone to Galva, Ill.

E. C. Allen, of the Forrest mine, has returned from New York to Ward, Colo.

E. B. Braden has been appointed manager the East Helena, Montana, smelter.

V. Van Hal and J. R. Phillips of the Banner, Jackson, are in Grass Valley.

Franklin Leonard, Pres. and Supt. Comstock Tunnel Co., is in San Francisco.

W. H. Hile, manager Last Chance M. Co., Weaverville, Cal., is in San Francisco.

A. Breton, Supt. Unity Co., Minersville, Cal., has returned from San Francisco.

R. B. Stanford, a Cripple Creek, Colo., mining engineer, is in San Francisco.

N. Wilson, Manager Reed & Hamlin interests, Cripple Creek, Colo., has resigned.

Clarence S. King of Baker City, Or., is examining mining property near Tepic, Mexico.

Manager B. Gilpin of the Prieta G. & S. M. Co., Parral, Mexico, is in Denver, Colo

J. C. Steele, Supt. Golden Jubilee, Weaverville, Cal., has returned from San Francisco.

Supt. W. P. Scott of the Black Oak, Carters, Cal., has returned from San Francisco.

Chas. C. Derby succeeds Jno. Truscott in the superintendency of the Oneida, Cal., mine.

Waldemar Lindgren, U. S. G. S., is examining the region adjacent to Huntington, Or.

A. C. Watson is in Bakersfield, Cal., superintending construction of five 35,000-barrel tanks.

Manager Wright of the 43rd M. & M. Co., Quesnelle, B. C., has gone to Ottawa, Canada.

F. W. Griffin has the California agency for the Bucyrus Dredger Co., Milwaukee, Wis.

J. Baier, manager Conrey M. Co., Virginia City, Mont., has arrived there from Boston, Mass.

E. S. Wiard of Empire State–Idaho M. & D. Co., Wardner, Idaho, has returned from California.

H. A. Jackson is Supt. of the Rocco-Homestake mine at Hamilton, White Pine county, Nevada.

C. Robinson, managing Bucyrus Gold Dredge Mfg. Co. of Milwaukee, Wis., is in British Columbia.

Oscar Szontagh, who has been conducting copper operations near Ione, Cal., is in San Francisco.

Mr. Gifford has been appointed mine manager of the reorganized Hall M. & S. Co. at Nelson, B. C.

Supt. Tautphaus of the Providence M. Co., Grass Valley, Cal., has returned from San Francisco.

Hayes & Rockwell of Galty Bay group, Silverton, Colo., have arrived there from the East.

F. W. Newell, ore buyer for the Selby Smelting & Lead Works, is convalescent after a severe illness.

Frank H. Clark has taken the position of Supt. Colorado & Oregon mine at Idaho Springs, Colo.

A. G. Randall of Chicago, Ill., has been examining property of the Copper Hill Co., near Rinconada, N. M.

J. M. Anderson, Western manager Gold Hills Exploration Co., Toronto, has gone to Sutton, Ont., for the winter.

C. A. Bronson, foreman British-American M. Co., has returned from Deadwood, S. D., to the mines at Rochford, S. D.

Supt. J. J. Morris of the Mt. Hood mine, Columbia, Cal., has resigned; C. Moyle of Rawhide, Cal., will take his place.

A. H. Oleson, a mine operator of Deadwood, S. D., was recently in Denver to make tests on the various concentrating tables.

L. W. Shinn, Supt. Utica G. M. Co., Angels Camp, Cal., writes that he is operating the new hoist with steam power at present.

Leo Von Rosenberg, a New York mining engineer, who has been examining California mining property, is in San Francisco.

R. Thompson, Treas., S. Montgomery Sec'y and G. L. Hays of the Colorado M. & C. Co. of Pittsburg, Pa., are in Telluride, Colo.

W. G. Stephan, late of Gold Bug M. Co., Georgetown, Cal., has gone to Anaconda, B. C., to take position with British Columbia Co.

W. R. Quinan of California, who superintended the erection of the dynamite factory at Kimberly, S. A., has assumed its entire management.

Manager Kingsbury and Supt. Chamberlin of the Puritan mines, near Loomis, Wash., have resigned. D. E. Jackman is now in charge.

T. J. Hurley, vice-president The Exploration Co., has returned to New York City from a visit to the company's property at Guanajuato, Mexico.

J. H. Emerson, Supt. American Eagles and John A. Logan mines, Victor, Colo., has resigned. John A. Stark of the Independence has succeeded him.

Lee Cochrane, traveling salesman for the Standard Fire Brick Co. of Pueblo and Denver, recently returned from a business trip throughout the Northwest.

C. W. Whitley goes from the East Helena, Montana, smelter to take charge of the electrical department of the new smelter building at Salt Lake City, Utah.

Prof. Dye of Nevada State University will be instructor of Virginia, Nev., mining engineering class, and will reside on the Comstock for next three months to personally supervise work.

J. W. Mercer, Supt. Liberty Bell G. M. Co., Telluride, Colo., has gone to South America to examine mining properties owned by New York men. A. Winslow will be in charge during his absence.

P. G. Mann is assayer for the New Mexican Rosario M. Co. at Nieves, Zacatecas, Mexico. He says that the mines of San Miguel de Mezquital, 15 leagues from Nieves, have been closed down entirely.

Col. Geo. T. Rives, superintendent Toronto Gold Reefs M. Co., Ltd., Lillooett, B. C., is in San Francisco to buy mining machinery, doubling the capacity. He has the only cyanide plant in the province.

F. D. Baker, M. E., of Denver, Colo., recently returned from Chicago, where he went to design the automatic sampling mill at the National smelter, which is one of the properties of the American Smelting & Refining Co.

D. H. Jackson writes from Nome, Alaska, Oct. 8th, that he will spend the winter on one of the tributaries of the Koobyityrun, and takes four men with him via Port Clarence, across the Arctic circle. He says: "We have no fears of the trip, though there will not be any California sunshine nor flowers in it."

Commercial Paragraphs.

The General Electric Co. has the contract to erect and equip the plant for the Guadalajara Tramway Co. at Guadalajara, Mexico. The entire contract is valued at $460,000.

Manager Panting of Burnt River M. Co. has given the Risdon Iron Works of San Francisco an order for five stamps, two Johnston concentrators, and other machinery, for the Gold Hill mine, Baker City, Or.

Under date of Sept. 15, M. F. Ferry, manager Minas Prietas Reduction Syndicate, Ltd., writes from Torres, Sonora, Mexico, to Heyl & Patterson, 51–53 Water St., Pittsburg, Pa.: "We like the conveyor and are taxing it to its utmost capacity, putting through 50% more with it than we estimated. We are handling partially dried sluices and do not think any other conveyor could do the work."

Books Received.

"The Metallurgy of Gold," M. Eissler, 638 pp., price $7.50; published by D. Van Nostrand Co., 23 Murray street, New York City. This is the fifth and latest edition of a book that has had extensive sale, and the additions to former contents add to its value. The book continues to treat the subject almost entirely from a European and colonial standpoint, and, so far as this west half of America is concerned, is not up-to-date.

Catalogues Received.

From Manning, Maxwell & Moore, 85-89 Liberty street, New York City, comes the largest catalogue received this year—704 pages, 2081 illustrations. The book is 10 x13 inches, and is a complete illustrated compendium of description of machine tools and attachments made by that concern.

Recently Declared Mining Dividends.

Boston Gold–Copper Smelting Co., 2½%	Nov. 15

Latest Market Reports.

San Francisco, Nov. 1, 1900.

SILVER—Per oz., Troy: London, 29⅞d (standard ounce, 925 fine); New York, bar silver, 64¼c (1000 fine); San Francisco, 64¼c; Mexican dollars, 50½c.

The London Statist says India absorbed 50,000,000 ounces of silver in the year ending Sept. 1, and predicts that that country will want nearly one-quarter of the world's production.

Chinese currency and currency regulations present some most peculiar features and the currency customs of the province of Kwang Tung, the province of which we know most, as are remarkable as any. Roughly speaking, the currency of the Kwang Tung province consist of what may be called "chopped dollars," or broken silver, and Canton subsidiary coins of 10 and 20 cents. The dollars in circulation are principally Mexican, but the Japanese yen (silver dollar), the Hongkong dollar and the Kwang Tung dollar are also current. All these dollars are supposed to be of the same weight and fineness—that is, of 416 grains .600 fine. The variation, if any, is very slight. All Chinese merchants and bankers stamp with an iron instrument every dollar that passes through their hands, and in the course of time these coins become defaced and broken, when they are denominated "chopped dollars," or "broken silver." Chopped dollars, Kwang Tung dollars and subsidiary coins are not current in the British colony of Hongkong. "Clean dollars," or dollars not chopped, are usually at a premium of about 2%.

The local currency is in no way guaranteed by the Chinese Government. It is taken on its own merits only, which necessitates examination by merchants and bankers of every dollar that passes through their hands, and the "chop" is to enable them to recognize any dollar they may have paid out. Hongkong bank notes pass freely, being preferred to silver, and are therefore at a premium. The bulk of the merchandise shipped by the foreign merchants is paid for by checks on Hongkong, which can generally be sold to the native banks at a premium varying one-fourth of 1% and sometimes as high as 1½%. The Chinese merchants, in effecting exchanges between themselves, use the taels. This is not a coin, but merely a weight of silver, and is considered the local currency. Seventy-two taels are equal to $100. Among the poorer classes and in the country districts the copper "cash" is used, of which 1000 are about equal to a dollar. The Mexican dollar and the Japanese silver yen are legal tender when not chopped.

From the foregoing it will be observed that the local currency is debased. It is not legal tender in Hongkong—that is to say, the chopped dollars. Kwang Tung dollars and subsidiary coins are accepted by the Government and by the banks and merchants, but shopkeepers will accept such money only in small sums. Nearly all foreigners residing in Canton—particularly the merchants—keep the bulk of their money in the Hongkong bank, and draw against their deposit by check when required.

COPPER.—New York: Lake, 1 to 3 casks, $16.87½ cash; carload lots, 16.50; Electrolytic, 1 to 3 casks, 16.75; carload lots, 16.37½; Casting, 1 to 3 casks, 16.50; carload lots, 16.25. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.37½; Salt Lake City, $4.20; St. Louis, $4.27½; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £17 2s 6d=3.83½c per ℔.

SPELTER. — New York, $4.10; St. Louis, $3.95; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $13.25; gray forge, $13.00; San Francisco, bar, per lb., 2½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $19.00; open hearth billets, $22; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $27.50; San Francisco, ton lots, 30c; 1000 ℔s., 30½c; 500 ℔s., 30c; less, 31c; bar tin, ℔ ℔, 35c.

QUICKSILVER. — New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.50 ℔ flask of 76½ ℔s.; Export, $45.

NICKEL.—New York, 50@60c ℔ ℔.

MAGNESIUM.—New York, $3.00 ℔ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¼c; slab, 5¾c; bar, 7c.

BABBITT METAL.— San Francisco, No. 1, 10c.

SOLDER. — Half-and-half, 100-℔. lots, 18.70c; San Francisco, Plumbers', 100-℔. lots, 15.85c.

ASSAY LITHARGE.—San Francisco, 10c ℔ ℔, small lots.

BISMUTH.—New York, ℔ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PHOSPHORUS. —F. o. b. New York 50@60c ℔ ℔.

TUNGSTEN.—New York, ℔ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.— San Francisco, crude, $17 ℔ oz.; New York, $18.20 per Troy oz

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ℔ set; 14 oz., 40s., 10½c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32½@33½c ℔ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ℔ ℔.; soda ash, $1.60 ℔ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ℔ ℔.; blue vitriol, 5½@6c ℔ ℔.; borax, concentrated, 7@8c ℔ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾ @ 2c; nitric acid, in carboys, 8c ℔ ℔.; caustic soda, in drums, 3@4c ℔ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

OILS.—Linseed, pure, boiled, bbl., 86c; cs., 91c; raw, bbl., 84c; cs., 89c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 70c; cs., 75c; No. 1 bbl., 50c; cs., 55c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 65c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING OCT. 23, 1900

660,356.—Water Gate—C. H. Baker, Topia, Mexico.
660,178.—Flushing Tank—C. J. Ball, Los Angeles, Cal.
660,362.—Fruit Packing Form—S. L. Casella, Alma, Cal.
660,147.—Fire Hose Nozzle—B. C. Crane, Montesano, Wash.
660,370.—Pitcher Cover—Drennan, Smith & Graham, Bodie, Cal.
660,491.—Car Coupling—C. E. C. Edey, Tacoma, Wash.
660,498.—Leaching Ores—J. A. Fleming, Globe, A. T.
660,499.—Leaching Ores—J. A. Fleming, Globe, A. T.
660,371.—Heater—Kate J. Foley, Berryessa, Cal.
660,542.—Riveting Machine—S. Fore man, Sacramento, Cal.
660,105.—Saw Sharpener—J. W. Green-Portland, Or.
660,373.—Powder Mill—F. A. Halsey, San Rafael, Cal.
660,429.—Boiler—P. W. Hanford, Oakesdale, Wash.
660,507.—Lifting Jack—J. T. Harbin, Condon, Or.
660,108.—Adding Machine—A. Hoch, Alameda, Cal.
660,438.—Window Sash—G. W. Holly, Palo Alto, Cal.
660,342.—Ore Separator—J. P. Smith, Denver, Colo.
660,319.—Tooth Crowns—J. F. Twist, S. F.
660,408.—Hop Drier—A. Wolf, Silverton, Or.
660,409.—Rock Drill—C. E. Young, Fremont, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Locomotive Headlight.—No. 659,795. Oct. 16, 1900. McDonald Elliot of Santa Rosa, Cal. The object of this invention is to provide an apparatus for the production of acetylene gas under such conditions that when the generator is subjected to violent shocks and oscillations, the water contained therein is prevented from splashing about under the violent movements. The gas is manufactured in only sufficient quantities to supply the single light which is used for locomotive headlights and for which this apparatus is especially designed. Means are provided for staying the flow of gas under the conditions of violent movements caused by the high speed of a locomotive, and means for automatically regulating the supply of water to the carbide and disposing of any water of condensation so as to keep it away from the carbide when not wanted. The generator consists of an outer casing having sufficient vertical height and made comparatively narrow in diameter. This is provided with an internal water seal and a rising and falling gasometer moving in the channel which forms the seal. A carbide chamber and ash chamber are removably located in the lower part of the gasometer, the upper edge of the carbide chamber being roughened so as to provide small passages for the gas between the roughened edges without allowing a sufficient space for irregular waves or movements of the gas which might be caused by sudden shocks of the apparatus. The valve by which water is admitted into the carbide containing chamber or basket is operated by a lever or fulcrum that when the gasometer sinks by reduction in quantity of gas within it, it will strike the lever and open the water supply, and when it rises it relieves the lever and the valve is closed by a spring or other suitable means.

Gopher Trap.—No. 659,932. Oct. 16, 1900. Z. A. Macabee, Los Gatos, Cal. The object of this invention is to provide an improved trap for catching gophers and similar burrowing animals. It consists essentially of a spring frame having transverse pointed interlocking arms at one end, loops through which these arms pass, and which when the trap is set by depressing the upper portion will separate the interlocking arms. A plate is fulcrumed upon the framework and a trigger engaging the plate holds the arms separated when the trap is set. The trap is then pushed into the hole so that the plate is in such position that when the gopher pushes out the dirt, as is his custom, it contacts with the plate and disengages the latch, thus allowing the arms which are operated by a stout spring to close together and impale the animal.

Powder Mixing and Incorporating Mill.—No. 660,373. Oct. 23, 1900. F. A. Halsey, San Rafael, Cal. The object of this invention is to provide certain improvements in mills which are designed to mix the ingredients of explosive powders and the like. It consists of an annularly channeled bed with runners and plows, and mechanism by which they are caused to travel around said bed. Means are employed for holding the runner out of direct contact with the bed, and disintegraters are fitted to travel with the runner, these disintegraters consisting of a series of disks or hubs mounted side by side upon a shaft and having radial arms, the ends of which are disposed in spiral lines from side to side so that as they move over the powder on the bed, they will act to break and disintegrate it into small particles. A lever arm is fixed to the shaft upon which these disintegrating arms or disks are carried so that the weight may be adjusted to provide a varying pressure upon these arms as they pass over the material on the bed. The main object of this improved mill is to produce 100% more grain of such dense powders as are granulated in the mill immediately after incorporation, and reducing labor and time 50%, and avoiding the ever-present danger of rubbing the incorporated material through sieves. After the composition has been properly incorporated the runners of the mill are raised sufficient to take the pressure off the cake and the circular cutters (which have been thrown over the plow during incorporation) are now dropped down; with a few revolutions the runners will have rubbed up the coarse cake; they may now be raised entirely while the mill is in motion by grasping the hand wheel on top. The plows and cutters continue in action, causing the rapid formation, with proper moisture, of round grains, this action to be continued until granulation is complete.

Dry Concentration by the Crown Process.

The Salt Lake City, Utah, Herald says: F. A. Flindt and S. W. Mosby have returned to Salt Lake City from San Francisco, thoroughly convinced that at last a practically perfect method of treating ores by dry concentration had been devised, and will call for their lease on the second-class ores of the May Day, equip the property with a plant and get down to business by Jan. 1st.

Before leaving for the coast to investigate the merits of the Crown Gold Mining Co.'s new dry process they shipped a ton of second-class ore with the purpose of seeing it tested, and on his return Mr. Flindt told the Herald that he had "witnessed the most wonderful performance he ever saw in the way of concentrating ore." The ore tested carried 8% lead in its crude form and the concentrates assayed 56% and the tailings contained only .98 of 1%, the closest saving Mr. Flindt ever saw.

Of the practicability of the process Mr. Flindt says there is no doubt, but the company guarantees nothing before demonstrations are made, and will not then sell the machines. When it is shown that the ores submitted can be successfully treated they contract to put in plants of adequate capacity to meet the requirements of each case, bear the cost themselves and charge a royalty for their use. If other arrangements are not made within the next few days, Messrs. Flindt and Mosby will contract with the California company owning the new process to install it at the May Day.

The Salt Lake Tribune quotes F. Enzensperger, who made himself conversant with the new process for the concentration of low-grade ores to be introduced at the May Day of Eureka by Messrs. Flindt and Mosby, as saying that it "promises to revolutionize the handling of that class of mineral, and that repeated tests have demonstrated that it is all which has been claimed for it. In the elimination of the gangue and the concentration of the metals, Mr. Enzensperger says a stream of air is applied to the ores as they pass over a fine silken belt and after they have passed through various meshes until they are practically reduced to a powder. With the aid of air the gangue is eliminated during the movement of the ore and the metals are deposited in the receptacle that awaits them. The new method is known as the 'Crown process.' It was developed by F. W. Wood, a California metallurgist, and is being exploited by Loring B. Doe of San Francisco, from whom Mr. Enzensperger is in receipt of a letter calling attention to the process. The latter as well as the inventor is expected in Salt Lake in a short time, and it is not unlikely that a branch manufactory will be installed at this point." *

SITUATIONS WANTED.

Technical, practical man wants superintendency of mine; latest methods of economic operating and organization, ore dressing, milling and treating. D. G , this office.

ELECTRICIAN AND MACHINIST would like to get a place in the country or city or in mine; has the best of letters. Box 56, this office.

WANTED. — POSITION AS ASSAYER AT cyanide plant or mine. Have had considerable experience and hold good references. Address "B," care of Wade & Wade, 115½ N. Main St., Los Angeles. Cal.

MINING ENGINEER (technical training), twenty years' experience as surveyor, assayer, superintendent and manager of mines and mills; business qualifications; linguist; at present general manager mining and milling proposition in Mexico; desires to make a change on account of health; best references. Address S. O., Mining and Scientific Press.

WANTED.

WANTED —The address of Thomas Watts, bricklayer and miner, formerly of Butte, Montana, and Denver, Colorado. If dead or alive, any information will be thankfully received by Will B. Cameron, 409 Main St., Seattle, Wash.

Charcoal Burner wanted. Must speak Spanish and be capable of burning 1200 cords of mesquite per month into charcoal for smelting. Healthy part of Sonora, Mexico. Salary $100 gold per month. Only sober man need apply. References and record of experience required. Address C. Coal, this office.

CHROME IRON ORE WANTED.

State price and quantities that can be furnished. Send samples and all information to W. C. CO., 3214 Twenty-fifth St., San Francisco, Cal.

INFORMATION WANTED regarding whereabouts of John R. Williams, about 70 years old. Last heard of as Supt. of a mine in Copper's Hill, Vermont, in 1866. Has an adopted son about 32 years old. Supposed to be placer mining in the West, possibly California. $25.00 reward at Deseret News Office, Salt Lake City, Utah.

REFRACTORY ORES WANTED.

1000 TONS or more which will assay $75.00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.

C. J. TALLON,
308 MARKET STREET, SAN FRANCISCO, CAL.

Quicksilver

—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - - 320 SANSOME STREET,

WRITE FOR CATALOGUE OF MINING MACHINERY AND SUPPLIES.
22nd and Larimer Sts., DENVER, COLO.

FOR SALE.

Lease and Bond, Eighteen Months, Easy Terms, Copper Property, New Mexico.

High grade ore with good gold values. Accessible. Plenty wood and water. Strong vein. Three shafts. Will pay from start. Adjoins large producing mine. **H. E. RUNKLE, El Paso, Texas**

FOR SALE.

One 10″x12″ Double Cylinder, Double Drum Mine Hoist.

One 14″x30″ Duplex Air Compressor, Corliss Steam ends.

Two 54″x16′ Return Tubular Boilers.

One No. 6 Llewellyn Feed Water Heater.

One 36″x9′ Air Receiver.

One Duplex Boiler Feed Pump.

All in good working order and nearly new. Also Rock Drills, Sinking and Station Pumps, Air Pipe, Ore Cars, Skips, Wire Rope, Blacksmith and Carpenter Tools. A bargain for anyone wanting an up-to-date mine equipment. Address Box 376, this office.

THE CALIFORNIA DEBRIS COMMISSION, HAVING received applications to mine by the hydraulic process from the Cataract and Wide West Gravel Mining Co., in the Wide West Gravel Mine, near Eho. Calaveras Co., to deposit tailings in North Outlet and Prospect Gulch; from H. Sleighter and Thomas Harper, in the San Francisco Mine, near Todd, Placer Co., to deposit tailings in Dardanelles Canyon; from Chas. S. Deisem, in the Riffle Point Mine, at Grass Flat, Sierra Co., to deposit tailings in Grass Flat Ravine; from Geo. Fitzgerald, in the Lone Star Mine, near Cromberg, Plumas Co , to deposit tailings in Jackson Creek; from G. A. and F. W. Bruckerman, in the Renaissance Mine, near Howland Flat, Sierra Co., to deposit tailings in a worked-out pit; from J. R. Bell and A. B. Jacks, in the Badger Hill Mine, near Spanish Ranch, Plumas Co., to deposit tailings in Whitlock Ravine; from W. T. Sherman and O. F. Caya, in the Last Chance Mine, near Port Wine, Sierra Co., to deposit tailings in French Ravine; from C. N. Kingsbury, in the Conger Gulch Gravel Mine, near Igo, Shasta Co., to deposit tailings in Dry Creek; from John McGrath, in the Independent Mine, near St. Louis, Sierra Co., to deposit tailings in Sears Ravine; and from J. F. Cowdery, in the Chandlerville Mine, near St. Louis, Sierra Co , to deposit tailings in Sackets Gulch, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on November 12, 1900, at 1:30 P. M.

BENJAMIN T. LLOYD, STOCKS, BONDS AND MINES.

Have immediate customers for well-developed Gold and Copper Properties.
P. O. Box 608, **SALT LAKE CITY, UTAH.**

The Carnegie Steel Co.

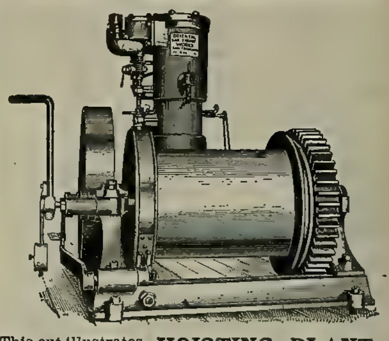
Is one of the big manufacturing concerns which have sent duplicate orders this month for

Cross Oil Filters.

Others as prominent are ordering from all over the civilized world. Only merit counts with these purchasers We guarantee the CROSS to save half your oil bills, and send them on approval at our expense. Catalogue 38.

THE BURT MFG. CO.,
Akron, Ohio, U. S. A.
Largest Mfrs. of Oil Filters in the World.

We also manufacture the BURT EXHAUST HEAD.

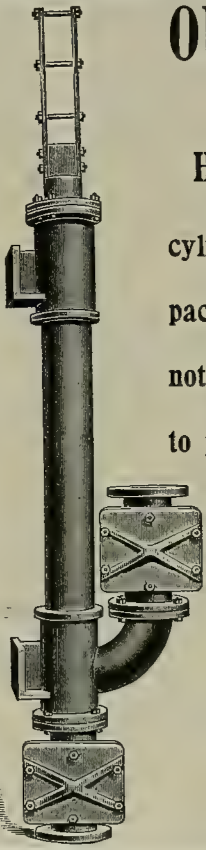


This cut illustrates our 4 H. P. to 8 H. P. **HOISTING PLANT.**

Larger sizes built to suit the demands of our customers.

It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake. No better device has been designed for this purpose. For prices and further information address the builders.

Oriental Gas Engine Co., 227 Folsom St., S. F.



OUR NEW JACK-HEAD PLUNGER PUMP

HAS THESE POINTS OF EXCELLENCE:

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily repacked.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

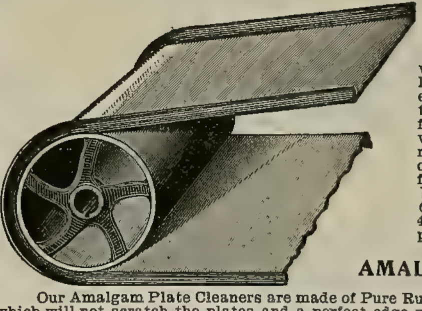
Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.

Send us your inquiries.

W. T. GARRATT & CO.,
Cor. Fremont and Natoma Sts.,
SAN FRANCISCO, CAL.

SPADONE'S CONCENTRATOR BELTS.



PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

THE GUTTA PERCHA RUBBER AND M'F'G CO ,
30 and 32 FREMONT STREET, Telephone Main 1813. **SAN FRANCISCO, CAL.**

Smelting Zinc Ores.

Colorado is considerably interested in the smelting of zinc ore, or the profitable disposition of low-grade ores carrying zinc. It was thought that they might be shipped foreign, but ores carrying less than 45% zinc do not pay to export. Nor are the foreign smelters any better prepared to treat zincy ores than the local plants. Cheap labor, cheap coal and other supplies give foreign smelters some advantage, but there is no metallurgical superiority. Zinc ore has been sent from Leadville to Swansea for $9 per ton, and about as low a rate has been secured to Antwerp, but neither Welsh nor Belgian smelters have shown any superiority in securing returns. They have placed 43% zinc as the limit, and for ore carrying that they pay $4 per ton, deducting 60 cents per unit for each unit under 43, and paying 60 cents for each unit above that figure; but Leadville miners say that at those figures there is no margin over the cost of mining and hauling.

The quantities of ore carrying 30% and less in zinc have been virtually valueless, but it is thought that a suitable system of concentration, and a change in the method of lining zinc furnaces, may result in a more effective and economical system of zinc distillation by excluding the lead and iron. The presence of over 1% of iron or 3% of lead militates against successful zinc extraction, and if a method of lining zinc furnaces could be devised that would resist corrosion, the action of the iron oxides which ordinarily destroys the fire clay of which the retorts are made could be successfully resisted, the idea being to apply such sintering material to the lining as to produce a solidly cohering substance impervious to iron oxide or other corroding ingredient, and capable of sustaining the heat to which it would be exposed.

◆

THE prominence of what is known as "the low-grade proposition" is one of the most noticeable features in the gold mining of to-day. Time was when the "ounce-a-day" placer diggings, or the superficial quartz of high grade, alone found favor. Those days have passed; high-grade mines still attract investment and due attention, but the "low-grade proposition," the big deposit of lean ore, in quantity sufficient to make permanent calculations upon, the large amount that gives promise of small but steady dividends, is that which now attracts the greatest attention.

Men, "Busy" and Otherwise.

At times, as a matter of general benefit, it has been suggested herein that an account of anything of effective value produced in the mining and metallurgical world likely to be of common benefit might, with propriety, well appear in this paper for the common good, on the principle that "everybody is wiser than anybody," and that "my light is none the less for having lighted that of my neighbor." It is manifest to many of those whose opinion is worth having that much of practical value may be told by the men who do things.

It is customary now with technical journals to encourage such interchange of information. The leading London journal of the kind keeps the following constantly at the head of its announcements: "Many of our readers have had experiences in mining and milling, some record of which would be of great interest and value to others. Many have made experiments in different directions, and others have met and overcome difficulties in practice, some of which would help others in like cases and give them practical aid. Such readers would do great service to us and to their fellow workers by sending us from time to time some notes of their experience. They would be welcome, however brief, and, we are sure, would be read and appreciated by many."

Of course, during the forty years of its existence, this paper has probably published more original matter of that kind, namely, how things are done, by the men who do them, than any other journal in existence; but, yet, there are many among its readers who make no record of their successful experiments and experiences in mining and metallurgical practice, and who when they read such suggestions as these, while they silently acquiesce, and, maybe, get so far as to think, "Well, I shall, some time, send the MINING AND SCIENTIFIC PRESS some notes of what I think was a success in this case;" yet, when the regular day's work is done, other duties may come up, or one may feel "too tired" to put his good resolve into execution. The most common excuse or reason that a man gives himself and others for not doing these things and others is, that he is "too busy." No doubt, many of us wish that the days were sometimes more than twenty-four hours long, and, yet, everyone has all the time that there is, and a little exact regulation of hours and duties helps greatly in giving one the necessary time to devote to other things which sometimes embrace the best things of life—things that can not be paid for in current coin, but yet are none the less valuable, not only to the giver, but to the recipients.

This matter of being "too busy" is more of a habit than a fact. As we write we have in mind a leading Colorado miner, who finds time to send many matters of great practical value to this journal. One might think he was a very busy man; he is superintendent of five several mines; makes long journeys over this west half of America as an examiner of mining properties; gives expert testimony in mining litigation; bestows some practical attention on mining problems that come up in his daily life; and, as he was recently elected to the Colorado Legislature, will doubtless be heard from there in aid of the miner this winter. Yet this man is not "too busy" to write articles on mining and metallurgy for this paper—articles whose merits are so manifest that they are copied elsewhere immediately upon their appearance. There also occurs to our mind an almost precisely similar case in California, except that the Californian who is not "too busy" to send results is only superintendent of two mines instead of five. These two mining men are instanced as illustrating that men may be fairly occupied in large enterprises and yet not be "too busy" to accord a little of their information to their fellow miners and metallurgists. As a matter of fact, none but busy men are asked to do these things, as the man competent to give pointers of value is usually in demand to work for himself or others, and the fact that he is busy shows that he amounts to something.

Some may have also in mind gentlemen whose ability is more than commensurate with their energy, who spend their time going round telling others what busy men they are, and, doubtless having said it so much, they believe it themselves. The latter class are not cited for criticism, so much as the two former are instanced as indicative of what men may do, though really busy.

The Leasing System.

In Colorado and other States the leasing system has of late years aided much in mine development, though, so far as the lessees are concerned, their share has not always been commensurate with the effort and expense. The system of leasing deserves commendation; where from inability or other reasons the owner of the ground is unable or unwilling to work it, the lessee offers usually good opportunity to demonstrate its value. Many leases are expiring in Colorado and elsewhere, and business justice to the lessees, as well as a wise system of mutual co-operation, which results eventually in mutual profit, would suggest that a fair division of profit be accorded the lessee. Often he takes all the risk of loss; does most or all of the work, and, where successful, the owner of the claim or the mining company as often gets the biggest share; but in case of failure the loss falls mostly upon him. Few fortunes are made by lessees, though in the majority of cases moderate money has been realized by intelligent effort and diligent prosecution of work. The most of such money has been made by the claim owners or mining companies, many of the latter having reverted to the system of leasing their properties after having tried themselves to make a success.

A high rate of royalties works against the lessee; even with a fairly profitable lease, if nearly all his profits have to go to the property owner in royalties there is little inducement for continuance. He may be able to stand off the railroads and hold things even with the smelters, but with a high royalty there is seldom sufficient or favorable opportunity for the systematic and extended working that would result in common profit to all. Another thing that would help the lessee would be a longer period for which leases were granted. There is rarely objection on the part of those who lease their properties, so long as they are unproductive, to have the lessees diligently develop them, objection to continuance sometimes arising when they have demonstrated their value. A good way to do in connection with such general suggestion of extension of the time for which leases are ordinarily made would be to date those leases from the time of the first shipment of ore. It is bad to attempt to make too hard a bargain with anybody; it is not business to trade upon anyone's necessities in causing him to do that which by force of circumstances he may have had to do.

The relation of this whole system of leasing to the development of the mineral wealth of any region is sufficiently manifest to justify notice. Usually a property that is being worked under lease is economically managed. Of course, it is not advised—nor would any intelligent mine owner consider it good business—to turn his property over to leasers, but in many a case where opened properties have been abandoned by the owner, or by the company, because of the lack of money or intelligent management, the lessee has made money for himself and the claim owner where previously everything lay idle, and in making that money—as also as in all cases where mining is going on—he makes times lively for the surrounding vicinity to the extent of production, for every miner employed gives employment to ten others who are not miners, but who share in the created wealth. And lessees are usually not content with even that, but when they have made a little money they generally use it in opening up other abandoned properties, or in developing new territory, and in this case they constitute just the kind of capital needed in the mining business—intelligent mining with the gambling element left out of it; mining by men who know what they are doing and have nerve enough to put their money into mining operations that take nothing from any one but benefit in common, with all the local advantages that such condition confers.

It is not uncommon to look to "Eastern capital" and "foreign investors" for money necessary for development. Both sources of mining capital are commendable and welcome, but it sometimes occurs that in looking too far afield for the necessary elements of developing, an important factor in the problem may be overlooked, that is, the lessee. This is not a plea nor an argument for the lessee, who is usually able to take care of himself, and is merely intended to indicate in what direction mutual aid and profit may often lie. The subject is an important one.

Concentrates.

THE bottom of the Banner mine shaft, Butte county, Cal., is 500 feet below sea level.

NEXT to mismanagement, the most fruitful cause of failure in mine development is insufficient capital.

THE caving system has been employed in iron ore mines for many years, and is now applied to the mining of copper ore in the Utah Consolidated, Utah.

AT an elevation where the aneroid barometer registers 21 inches, the theoretical height to which a pump will suck is 24 feet; the actual suction would not be over 17 feet.

A 5 H. P. ENGINE ought to run a dynamo to supply forty lights of sixteen candle power each. A gas engine would do if it had a balance wheel heavy enough to run uniformly.

THE Rio Tinto is Spain's biggest copper mine, and from about 1,500,000 tons pyrites annually extracted about 20,000 tons copper are produced. There is an annual profit of about $800,000.

IT is not uncommon to work over the same ore with cyanide two and even three times. Near Wickenburg, Ariz., tailings from the old Vulture mine were recently treated for the third time at a profit.

IF TWO MEN on opposite sides of the earth looked along two parallel lines when the sun was midway between the lines, both would see the sun in the same place, but it would be rising to the one and setting to the other.

A PIECE OF TOOL STEEL should in all cases be left in the water at least as long as it was in the fire. If it takes twenty minutes to heat up a piece it should be left in the water twenty minutes to cool, and longer if necessary.

THE Gwin mine, Calaveras county, has probably as large a pay shoot as any in California—over 1400 feet. An item like this will bring reports for the next ninety days of ore shoots elsewhere from 1500 to 15,000 feet in extent.

A NEW HYDROCARBON—a solid—is made by passing pure dry acetylene gas through a tube containing finely powdered copper. The cuprene thus formed is almost insoluble; neither nitric nor sulphuric acid has much appreciable effect upon it.

CROOKES says that his experiments indicate that iron at high temperature and under great pressure will act as a solvent for carbon, and allow it to crystallize out in the form of the diamond—conditions existent at great depths below the surface of the earth.

THE average piston speed in engines with cylinders 4 to 7 inches diameter is about 400 feet per minute; above 7 inches, about 550 feet. The number of revolutions is found by dividing the required piston speed in feet per minute by twice the length of the stroke in feet.

THE use of coal which contains sulphur will cause deposition of sulphuric acid upon the walls and tubes of the boiler, necessitating frequent cleaning. The more moisture the greater the corrosive action of the acid. Mixing lime with the coal prevents such acid formation.

IN tests made by engines, one pound anthracite coal evaporated 9.7 pounds water from and at 212° F.; one pound bituminous coal evaporated 10.14 pounds water; one pound fuel oil, 36° gravity, evaporated 16.48 pounds. A cord of well-dried white oak weighs 3850 pounds, is considered equal to 1600 pounds bituminous coal.

A FLYING MACHINE is considered feasible, and one capable of sustained flight will undoubtedly be produced. Probably the greatest (and, perhaps, unsuperable) difficulty will, however, be met with in the matter of alighting. Safely reaching the ground after prolonged flight will be the hardest part of the problem to solve.

FOR the Diesel motor or oil engine is claimed a theoretical heat efficiency of 50% for the single cylinder engine, and 70% for the compound type. The heat efficiency of a good gas, gasoline or oil engine is from 15% to 30%. The Diesel motor was described and illustrated in the issue of Nov. 12, 1898.

THE volume of compressed air delivered at sixty pounds pressure at an elevation of 10,000 feet is 72.7% of the volume delivered at the same pressure by the same compressor at sea level. A compressor which, at sea level, would supply power for ten rock drills, would, at an altitude of 10,000 feet, furnish air for only seven drills.

THE principle of the pyrometer is based upon the expansion and contraction of two metals, an iron tube being inclosed in a copper tube, or vice versa, both being connected at their lower ends; the difference in the expansion of these tubes under heat is transferred by a movement to a pointer, which indicates the temperature on a dial.

WOOD, like gaseous coal, distills off volatile or tarry matter, often sticky, and brown in color, and combustible, if sufficiently high temperature is reached. These do not constitute a true "smoke." In the engineering use of the word "smoke" it is to be understood that where the carbon particle does not burn to gas while hot enough to unite with oxygen, it cools to black carbon, lampblack, or soot, and a current of gas carrying such solid black particles in it is called "smoke."

IT is bad practice to overheat a steel tool in hardening and then allow it to cool slowly in the air until it has taken a certain color before plunging into water, since the coarse grain of the high heat will be left in the tool and it will not do good work. Self-hardening steel can, of course, be cooled in air without detriment, but it is not well to heat it too hot.

THEORETICALLY, a cord of dry oak wood is figured to have a value of 40,425,000 British thermal units; one ton—2000 pounds—good coal, 29,400,000 units; one barrel—42 gallons—crude oil, 6,150,000 units. On this basis, 4.78 barrels oil would equal one ton of coal, and 6.58 barrels oil equal one cord dry oak wood. In practice the relative proportions and values differ from these figures.

ORE impregnated with arsenious or sulphuric acid could probably be economically treated by the cyanide process, if, after light roasting, application be made of chlorate of lime. Jos. Smith at Pine Grove, Nevada, claims to have so successfully treated such acid ores, securing an extraction of 90%, with a consumption of potassium cyanide of one and one-fourth pounds per ton of ore.

WHERE a man takes a mining property under a bond and lease, with nothing expressed as to what shall be done with the machinery for exploitation, such machinery belongs to the lessee, and the latter has a right to remove it at any time during the life of the lease; and if the lease be forfeited for any reason, he can remove the machinery within a reasonable time after such forfeiture.

IN connecting a safety valve to a steam boiler, if provided with a flange joint, it should be bolted to the top of the dome; if it is threaded for a pipe, the connection with the top of the dome or its equivalent should be as direct and as short as possible, and of the same size as the opening in the valve. No valve or other fittings, screwed or flanged joints should be placed between the safety valve and the dome.

TO CLEAN rusted tools and instruments of steel, if the rust is heavy, stand the tools in coal oil for a few hours, but if only slightly rusted this is not necessary. Next dip the articles in liquor potassa for a few moments and then put them into a strong solution of potassium cyanide. Remove; clean with a paste of the cyanide, castile soap, chalk and water; rinse, and place in a saturated solution of chloride of tin and leave over night. In this manner every particle of rust is removed and the articles will come out clear and of a silvery whiteness.

THE "banket" of the Witwatersrand district, South Africa, is a siliceous mass, consisting of quartz pebbles embedded in a matrix composed of sand, pyrite and other minerals, all cemented by secondary silica. The large quartz pebbles have all the characteristics of vein quartz, but show under the microscope undulous extinctions and other evidences of dynamic action to which they have been subjected. They are frequently cracked, and then sometimes show veinlets along the fractures. The quartz pebbles often carry pyrite and other sulphurets, as zinc blende and galena.

THE lowest temperature registered in the open air by any thermometer on earth is 90° below zero, F. The lowest laboratory temperature registered is 434° F. below zero. This temperature was obtained by Prof. Dewar by evaporating frozen hydrogen in a vacuum. "Absolute zero" is 459° F. below zero. "Absolute zero" means that degree of temperature at which heat ceases to exist. It is accurately determined by the fact that all gases expand and contract alike at the freezing point, at the rate of $\frac{1}{459}$ part of their volume for one degree. As this contraction is due to loss of heat, it is manifest that when a gas has contracted 459 parts it can contract no further—its heat is all gone and its temperature then is "absolute zero."

THIS from Wallace, Idaho, is one of the hard ones. It was received a month ago, and has been the subject of much unavailing research. "In placing a magnet between the ore bin and the crusher, to catch hammers, steel, etc., what is the arrangement? Must there be a current passing through the magnet all the time, or can a piece of steel or iron be charged from time to time and be effective? Of what are magnets for this purpose usually made, and how are they placed? Will a hammer remain on the flat surface of the magnet or will it have to drop over on the end to be arrested?" Never heard of just such an arrangement. T. A. Edison had some device for using magnets to separate the iron in auriferous sands, fully described and illustrated at great length in the issue of April 30th, 1898.

PROBABLY "spontaneous ignition" is a more exact term than "spontaneous combustion." That action is caused by the absorption of oxygen by any combustible matter so fast that the resultant combination raises the temperature to a point at which it will burst into a flame. The condition that favors such action is the presence of a body readily oxidizable, distributed in a finely divided state over some material whereby considerable surface is exposed to action by the oxygen. Oily rags and greasy waste fill this condition, and both are specially liable to the accident. The more oxidizable the oil the more imminent the danger. Vegetable oils are particularly liable to the accident. In coal dust in bunkers, because of the oxidation of the sulphur in it, also may occur spontaneous ignition.

MAGNESITE is used largely in the steel industry, where bricks made from calcined magnesite are used for lining furnaces and converters. Magnesite bricks of high grade are composed of 94% carbonate of magnesia; they are refractory and last longer than others. Cement manufacturers also line their kilns with those bricks. During the twelve years ending with 1898 California produced 6879 tons magnesite, worth $60,766. In European open-hearth steel works about forty pounds magnesite are used for each ton of steel produced. Greece is the greatest producer of magnesite, annually shipping about 20,000 tons to the United States, where it is landed at a total cost in Atlantic ports of about $4.50 per ton. Magnesite bricks are made therefrom by Fayette Manufacturing Co., Layton, Pa., and Harbison & Walker, Pittsburg, Pa. The imported manufactured magnesite bricks are worth about $175 per thousand at New York or Philadelphia.

URANIUM belongs to the chromium group of elements, which includes also molybdenum and tungsten. It is a white metal, resembling iron or nickel, malleable, nearly as hard as steel, and is capable of a high polish, a specific gravity of 18.7. It is not a very abundant element; and not having superior metallic qualities, it has not found its way into the arts as a competitor to the cheaper metals. It is not found as a natural metal. The chief ore is pitchblende, which consists mostly of an impure uranic oxide. There are various methods of obtaining uranium from this ore. Uranic oxide yields, by the action of acids, uranyl salts, which are highly sensitive to light and are used for photographic purposes. The most important compound of uranium, from a practical point of view, is uranium yellow, a sodium of di-uranate, which is extensively used in painting and enameling glass and porcelain and for preparing uranium glass. Uranium salts are very readily separated from iron compounds and the process is not costly. The world's production does not mount high up into the thousands. Colorado is credited with seventeen tons of ore in 1898, valued at $530 per ton. The oxide fluctuates $2.25 and $4 per pound, while pure uranium is worth about $190 per keg, about two and one-half pounds.

BY the Russian mining laws, which greatly need changing, all the gold extracted must be delivered to the government gold laboratory of the district, where it is smelted and weighed, and an "assignat" delivered to the owner for its value, less the tax (from 3% to 10% upon ordinary mines, and 15% upon the mines which are the Czar's private property), a charge for laboratory fees, the cost of transmission to St. Petersburg, and a margin in case the local laboratory should have made an error of weight or assay in the vender's favor. The rate of purchase is fixed by the government. Six months or so later the head laboratory pays over the balance, but in the meantime the vender can cash his "assignat." Under these rules the private purchase or even possession of gold is a penal offense, exactly as in case of diamonds at the Kimberly, S. A., diamond fields. But as illicit diamond buying exists there, so illicit gold buying flourishes at Irkutsk, and the Chinese merchants are the offenders. They hang a few furs outside of a shop, or put a few chests of tea in the window, but this is merely a blind, for they make big profits by buying gold dust in quantities from a pinch to a bucketful, and smuggling it across the frontier into China. The Irkutsk gold laboratory was founded in 1870, and since then 1,173,456 pounds avoirdupois of gold, worth probably $300,000,000, has been sent thence to Europe.

IN treating slimes in Australia, the slimes are trucked to the works, and there the required quantity of quicklime to neutralize the acid contained in them is added as the trucks are emptied into a hopper discharging into a disintegrator. The lime required per ton of dry slime varies from twenty to sixty pounds. After passing through the disintegrator, the powdered mass is raised by a bucket elevator to a top hopper, which discharges into side tip trucks running over the tops of the vats. Over each vat is a 6-inch centrifugal pump, the suction pipe of which descends at an angle to within 2 feet of the bottom of the vat, while the discharge pipe is continued down to the floor of the vat, where it is terminated by a right angle bend on a swivel point, so that the flow can be directed across to any part of the vat. The vat, being filled with solution of cyanide, the centrifugal pump is started, and in a few minutes the whole mass is in violent agitation. Into this agitated liquor the powdered slime is dropped, truck by truck, until the whole charge, amounting to ten tons, is delivered, the agitation being maintained the whole time. A few minutes after the last truck is dropped in, the pump is stopped and the whole mass allowed to settle; this occupies twenty minutes, the solution being left absolutely clear on top. A pipe, mounted with swivel joint, and connected with the pipe service leading to the zinc extractor boxes, is then gradually lowered until the whole of the supernatant solution is drawn off. The vat is then filled with the weak solution, and the pump is once more set in motion; in a few minutes the whole mass is once more stirred up, and the first process repeated. After the second solution has been drawn off, clean water is added, and when the mass is worked into a slurry, a plug in the bottom of the vat is opened and the thin slurry run off in wooden launders, whence it is raised and delivered away by a large centrifugal pump. The first extensive trial on Croydon Quartz Crushing Co.'s slimes gave: Average value before treatment: Gold, 9 dwts. 11 grs.; silver, 2 ozs. 17 dwts. 4 grs.; gross value, £2 5s 10d. Average assay of residues: Gold, 2 dwts.; silver, 1 oz. 12 dwts.; giving a value of 11s 8d. The bullion banked was 198 ozs. 4 dwt. 19 grs., of a value of 16s 3½d per ounce; there was figured to be another 104 oz. 10 dwt. in the unsmelted precipitates, solution and zincs, to come in next clean-up, which, if so, would make the total recovery £1 8s per ton. The total cost was figured at 13s per ton.

Machine Mine Rock Drills on the Pacific Coast.

NUMBER V.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by by A. E. CHODZKO.

APPENDIX.

The former types of machines are all operated by compressed air (or steam) and belong to the category of the power drills.

It may be interesting to supplement these descriptions by presenting some types of drilling machines of different classes, some in use on the Pacific coast, and which have found special fields of usefulness in other parts of the country; I refer to the hand drill and to the diamond drill, and a few words concerning these classes of machines will perhaps not be out of place.

HAND DRILLS.—There is a two-fold idea carried out in the construction of a hand drill; first, to utilize human exertion to better advantage, and second, not to make the action of the machine subservient to the skill of the operator.

Rankine gives as the daily work developed by a man by hammering 480,000 foot pounds, and in turning a crank 1,296,000 foot pounds, being in the proportion of 1 to 2.7; and while the conditions of work with the revolving crank of a hand drill are probably less favorable than with a winch under a practically steady load (the case considered by Rankine), the fact remains that the turning of a crank, with resistances fairly balanced by a fly-wheel, is a better way of utilizing a man's strength than the consecutive lifting and dropping of a hammer.

And then, while an experienced miner can make remarkably good headway in hard rock, the proper handling of the bit and hammer is only the result of time and practice, whereas any laborer will soon learn how to turn the crank of a hand drill with a steady motion.

The machine here presented as a type of hand drill is the Jackson drill, made in Denver. Like in other similar machines, the three essential functions of a rock drilling tool are found.

The Leyner drill is made in Denver, Colorado, and can generally be described as having a valve motion of the Eclipse variety, a hand feed, and a rifle rotation bar with fixed pawls and movable ratchet. This machine differs from the other types found in the market in several important particulars. The bit is not attached to the piston, which is hammering on the head attached to the shank. The result is that the movable part of the piston can be made very light, and reciprocate at a high rate of speed. Another distinctive feature of this rock drill is the use of a hollow steel bit, through the interior of which water under pressure is injected into the hole, a special blowing-off attachment being provided whereby a jet of compressed air can be directed into the stream of water, to clean the holes from debris, and keeping the bit's edge cool. A similar central passage for injecting water is found in diamond drills, and offers the most direct way imaginable. In connection with former makes of rock drills of many years ago, the writer would quote the use of a hollow bit shank, wherein water was fed through a hollow piston rod, this shank being permanently connected to a small copper pipe inserted into an open longitudinal groove cut out of one side of the steel bit; the idea was to avoid the central hole in the bit, and this arrangement does not seem to have been adopted to any noticeable extent.

Another rock drill found on this coast is the Sullivan, manufactured in Chicago, and which may be characterized as follows: Valve motion, Eclipse type; feed, hand; rotary motion, stationary pawls, movable ratchet, head mounted on rifle bar.

SPECIAL FEATURES.—The motion of the piston valve is controlled by the main piston opening and closing suitable ports which lead to both ends of the valve chest respectively, where pistons of unequal size, forming part of the valve, are moving.

The pawls of the rotary motion are here formed of hardened steel rollers, engaging the rounded troughs of the teeth of the ratchet wheel, light springs keeping the rollers against the wheel.

This locking device is somewhat similar to the well-known arrangement of certain makes of hand twist drills.

Another noticeable feature is found in the arrangement of the buffers, which here are made of two spiral springs, each mounted on one of the side rods, and alongside the front head of the machine. At the back end, the rods are secured by two jam nuts,

separated by a spring washer. Cast steel is largely used in the construction of the Sullivan drill, and namely, for the shell, which is cast in one piece, no detachable guide strips being used, and the side wings of the cylinder being simply slipped from one end into the rectangular-shaped grooves of the shell. In this case, the reciprocating action of the air is replaced by the pressure of a cam, revolved by the operator, and which drives back the rod against a spring whose tension can be varied at will, and which in expanding projects the bit against the rock.

The rotary motion is produced by a rifle bar which, in this machine, is attached to the drill rod, its nut being stationary, and a part of the ratchet head revolving against stationary pawls. The feed is effected by hand, in a manner entirely similar to that used in power drills, permitting to vary the stroke at will.

ROTARY DRILLS.—In these machines the disintegration of the rock is no longer produced by the vis viva of a reciprocating mass, delivering successive blows on the head of a sharp tool; but a cutting ring formed, according to the hardness of the ground, of steel teeth or of pieces of black diamond, and secured at the lower end of a tube, is pressed steadily against the rock, and receives a rotary motion, its action being essentially abrasive.

A number of rotary drills have been devised, their use being more particularly well adapted to drilling very long holes, like in sounding, prospecting, and drilling oil wells.

The smaller sizes can drill in any direction, but a very deep hole will more generally be vertical, the tube being suspended, instead of resting against the bottom of the hole. A stream of water is continually forced down the tube, and flows out of the hole after washing the rock at its contact with the cutting ring, and carrying off the debris. Another advantage is that a core of the various material through which the hole is drilled can be secured and an exact section of the traversed ground obtained.

The several types of rotary drills can be classed under two heads, namely, heavy pressure and slow speed, or moderate pressure and high speed of rotation. The former is exemplified in the Brandt drill, a German machine which first became known at the Arlberg tunnel, in Austria, and which is at present used at the Simplon tunnel, between Switzerland and Italy.

The American machines belong to the second class, and no more typical illustration could be offered than the M. C. Bullock diamond drill, manufactured in Chicago, and which is here represented.

The scope of an already lengthy article will not permit of entering into a detailed description of the many ingenious features found in these machines.

The motive power used to produce the rotation of the tube may be steam, compressed air, water or electricity, and imparts to that tube a velocity ranging from 200 to 1500 revolutions per minute.

The cutting ring is pressed against the ground by a certain amount, registered on a thrust indicator graduated up to 5000 pounds, and maintained by an automatic feed, acting by means either of a screw or of a set of hydraulic cylinders. The depth varies with sizes of holes and various circumstances, and its largest type of machine is built by this firm under a guarantee of boring a hole 2⅞ inches in diameter when a depth of 5280 feet is reached.

The latter class of machinery is distinctly American, and it has led to the most remarkable results ever realized in the penetration of rocks at long distance.

Money Saving Power by Application of Blast Furnace Gas.

TO THE EDITOR:—I read under "Concentrates" of your issue of Oct. 20th an item about the use of blast furnace gas as fuel for gas engines. At one of the last meetings of the "Institut du fer et de l'acier" (Institute of Iron and Steel), Mr. Greiner, the emiinent general manager of the Cockerill works at Seraing, Belgium, read a paper in which he pointed out the saving of fuel made by using the gases of the iron blast furnaces as fuel for gas engines, especially for the generating of electricity. He proved that a stack of the common type, with a capacity of 100 tons daily, produces gases sufficient to generate 2000 H. P. The Cockerill Co. mines its own coal on the spot at a cost of $2.40 per ton, and thorough investigation and close calculations have shown that by using the furnace gas of their stacks a saving of fuel can be made of $36,000 per annum. The company has already ordered forty-eight gas engines which will be fed directly by blast furnace gas. The saving of the power that formerly went to waste is enormous, as the above figures show, and this new device of fuel is rapidly gaining favor. E. SMIT.

Colorado Springs, Colo., Oct. 27.

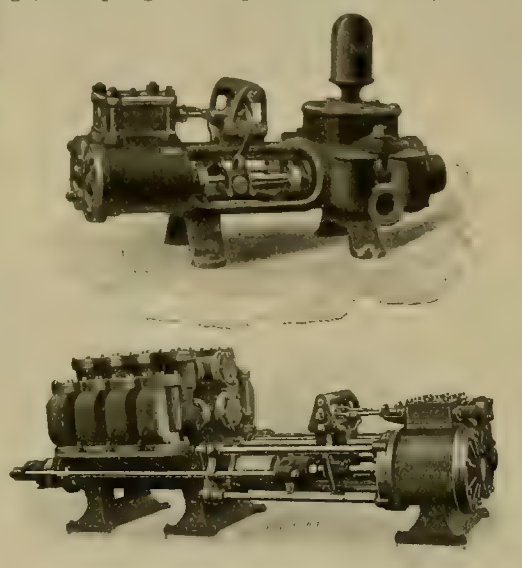
John A. Roebling's Sons' Co.

In the issue of October 6 appeared an extended notice of the exhibit at the Paris Exposition of the John A. Roebling's Sons' Co., Trenton, N. J., they receiving two grand prizes and two gold medals. Since then has been received an engraving of the exhibit, which appears on the front page of this issue.

Duplex Steam Pumps.

Herewith is illustrated a new line of duplex steam pumps, of which the Globe Iron Works of Stockton, Cal., has recently taken the general agency for California.

These pumps are known as the inside plunger design, the plungers are packed with a soft, fibrous packing, which remains stationary, considered advantageous for handling bad or gritty water; it can be kept tight under all conditions, and is readily accessible by removing the outside head on the pump barrel. The lever movement is adjustable to wear by hardened cone bearings. The suction valves are in pockets at the side of the pump barrels so they can be extracted without disturbing discharge valves or any other part.



Duplex Steam Pumps.

The plunger and piston rods are connected at the center by a compression coupling, which makes it possible to use brass rods on one end and steel rods on the other; either can be taken out or replaced independently. On the smaller pumps the steam piston is fitted with a steel ring, which is softer and more elastic than a cast-iron ring and unbreakable. The Globe Iron Works, Stockton, Cal., will send full details on application.

Exhibit at Paris of the Jeffrey Mfg. Co.

Herewith is produced a photograph showing the exhibit at the Paris Exposition of the Jeffrey Manufacturing Co. of Columbus, Ohio, showing their electric chain mining machines and electric and compressed air rotary coal drills, arranged so that power can be attached. About their space is arranged a fretwork of malleable and steel chains, which gives the visitor an idea of the styles of chains used in this country for elevators and conveyors in factories, mills and mines.

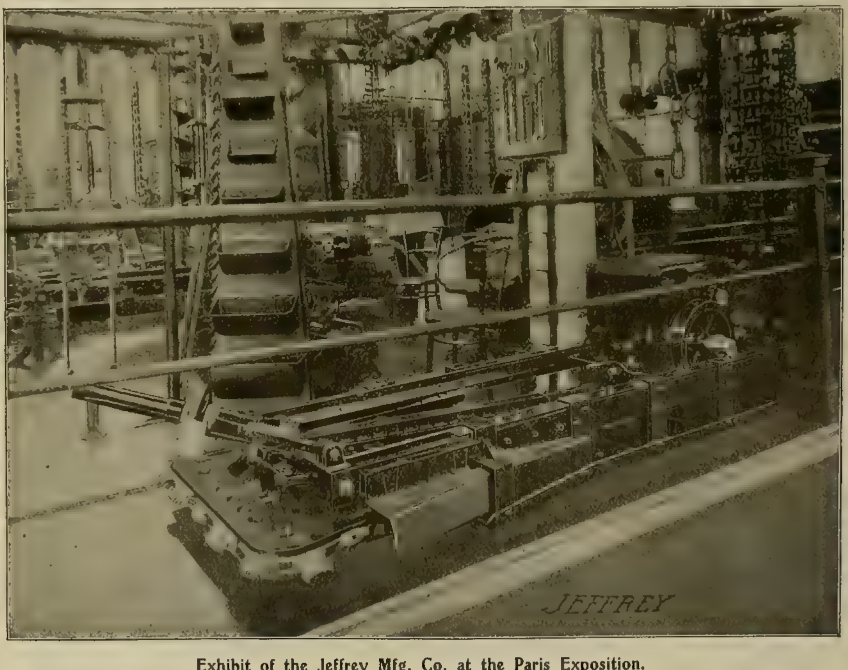


Exhibit of the Jeffrey Mfg. Co. at the Paris Exposition.

They issue a handsome catalogue covering their lines, published in English, German and French, of special interest to European engineers who visited their exhibit. Their exhibit was in charge of S. B. Belden, for years connected with the company, in charge of their Pittsburg office.

Usual Clumsy Attempt at Swindle.

The following is received from Newsome, Idaho. It is the usual "fake," a little clumsier than ordinarily, yet fixed up in a way calculated to deceive people who know no more about mining than mining knows about them. The thing is published as illustrative of the baitless hook so often dangled before gudgeons. Our Newsome, Idaho, correspondent writes:

"I enclose one of the most beautiful examples of the advantages of modern science that it has been my lot to see. Am thinking seriously of buying the whole plant and starting not less than 1,000,000 of the mills; I cannot conceive what niggardly policy limits the company to the establishment of a mere 1000—in its prospectus.

"What compound, double cylinder, direct acting, high pressure asses we have been to submit for so long to a mere fire assay! I presume it was to keep us from being too badly cut up over the discrepancy between this test and our present crude system of value saving."

OFFICE OF
.... GOLD EXTRACTION CO.,
ST. LOUIS, MO.

DEAR SIR:—We take your address from the.........., of which the subscribing attorney is a member, and knowing that your position enables you to furnish desired information, we take the liberty of requesting a favor which we hope you can grant without inconvenience. We enclose a folder prospectus, every statement of which we are certain is correct, and speaks for itself as to its value and usefulness, and which we request you to examine carefully. There are doubtless many persons of the middle classes and small investors, in your locality, to whom it is made available and who would be glad to invest in this valuable enterprise, and we are desirous of getting a reliable agent there to introduce the stock. The price placed on a limited amount of stock is $15 per share, the par value of which is $100, full paid and non-assessable. Agents are allowed 25% commission on orders. We would be much pleased if you would accept the agency yourself, as a better thing for both agent and investor can hardly be obtained; but if your duties preclude it, we request that you kindly furnish us the names and addresses of four or five reliable persons in your locality who would be suitable and available persons and who would probably accept such agency.

The kind of talk those fellows put out may be interesting. They say:

"Gold has become the sole standard of values, and its production the best paying industry of the age. Rich deposits of gold are scarce and seldom found; but thinly and widely scattered almost everywhere, its supply is conceded to be unlimited, provided it can be economically gathered.

"This problem of its easy and profitable gathering has been solved by the .... method, an entirely new principle of decomposing the gold-bearing earth or ore wet, in a cheap chemical solution, by this novel application of electricity, at very small cost, and producing most wonderful and profitable results.

"Its remarkable saving in placer dirt alone is sufficient to revolutionize present gold values. Out of many tests, probably hundreds, made upon placer in and adjacent to Colorado, it was proven that the present system of hydraulics does not save to exceed 2% of the gold which this method obtains. This means that if hydraulics will gather 25 cents per ton, this method saves in contrast $12.50. The same tests proved that the fire assay did not indicate a value of over 50% of the average obtained by this method from the same material. This raises the value of all 'pay' placer to a very good low-grade ore, and a most desirable proposition. We give a few instances: A sample from the Arkansas valley near Salida, Colorado, assayed $10.40, while it milled by this method

$21.60. Another sample from Goose creek, Colorado, showed 'not a trace' by fire assay, while it milled $9.90 by this method. A sample of black sand from a sluice in South Boulder creek, Colorado, assayed $29.60, but yielded by this method $46.20. A California sample assaying only a 'trace,' milled $8 to $12 in very many tests. A sample from San Juan river, Colorado, assayed $12 and milled $16.80. The same material run over plates saved less than 25 cents per ton, while the 'tailings' milled only 57 cents and assayed 37 cents, showing an extraordinary escape of fine gold flowing off with the water.

"But the success of this method is not confined to material carrying 'free' or metallic gold. A test of yellow clay taken at random from a cellar being excavated in Washington, D. C., showed $8 per ton gold. In the State of New York, between the Mohawk and St. Lawrence rivers, is a vast deposit of sand of lacustrine origin. It contains practically no 'free' or metallic gold, usually shows only from a 'trace' to $1 per ton by fire assay. Cyanide will only save about $1 gold per ton, while this method gets from $7.50 to $30, and has obtained as high as $50. This deposit is a great puzzle metallurgically, as accepted methods are valueless. It is a spur, geologically, from the great auriferous formation extending from Nova Scotia across British America, Alaska and Siberia, is inexhaustible and well located for cheap milling, water and fuel being plentiful, and labor reasonable.

"Again, from Maryland southward along the Appalachians is a vast auriferous country, sometimes developing 'free' gold, but, for the most part, resisting ordinary methods to gather 'pay,' but all eligible to this method, including the rich clays and vast deposits of talcose slates.

"It is hardly necessary to state that a process which is so successful in placer earths is equally so in all 'dry' auriferous ores, that is those containing little or no lead, copper or zinc. We append a few results of tests carefully made: Keystone ore, southern Nevada, fire assay $237, our result $840; Old Faithful, Montana, fire assay $5.20, our result $16; Iron Sulphide, Empire, Colorado, fire assay $21.60, our result $33; Astre ore, New Mexico, fire assay 60 cents, our result $13.20; New Prospect, Goose creek, Colorado, fire assay 'not a trace,' our result $6.67. These are a few of the extraordinary results obtained. Not all ores give such extraordinary results, but the proportion is very large.

"This wonderful method, as will be seen by the above comparison, saves gold where all others lose it, and produces large and wonderfully profitable yields where none before have attained pay. It is no longer necessary to find rich deposits, but only to save what was formerly wasted. In placer dirt, which yields only from 10 to 25 cents per ton by usual methods, it is common to save by this process at least $10 per ton, and sometimes far exceeding that amount. A mill with an output of fifty tons per day and an average yield of $10 per ton would produce $500 per day. Subtract from this $3 per ton or $150 per day for milling expense, leaves $350 net per day or $105,000 per year profit for 300 working days. The investment for such a mill complete would be under $50,000, thus showing it would more than pay for itself twice each year.

"But it is not necessary for this company to do its own milling to any great extent. Outside capital will be only too glad of the opportunity, and this company need only collect its royalty. This should be moderate and reasonable, say 5% only of the gross bullion output of the mill. This low royalty, upon the mill above mentioned, would be $7500 per annum. Upon 100 such mills in operation it would be $750,000 each year; and upon 1000 such mills in operation, which is not an exorbitant estimate for the United States alone, it would be $7,500,000 per annum, with no outlay save collecting the royalty alone. This is without mentioning its use outside the United States, while in the remaining gold-producing countries of the world it should easily be double that of the United States alone, or a grand total of $22,500,000 annual royalty. Thus it is seen the proposition is one of enormous profit from a single mill upwards and in a field now not even attempted.

"But this is not all. By a change of chemicals 'dry' silver ores, now seldom utilized, can be just as successfully treated, and by changing chemicals and electric current equally wonderful work can be accomplished in low-grade mercurial ores.

"We have also adapted to the gathering of the precious metals by amalgamation with mercury a machine nowise equaled by any other invention for the purpose before made.

"All these discoveries and patents, when issued, will be the exclusive property of the .... Gold Extraction Co., and will constitute a valuable monopoly, the profits of which, with proper management, are almost incomputable. It is usual in such cases to allow large capitalists to absorb and monopolize the benefits of such discoveries, and it never reaches the public until it has been already largely inflated. On the contrary, this company has decided to allow the public to share in the profits of its very initial promotion; and for which a limited amount of stock is offered. This company's stock is divided into shares of $100 each, full paid and non-assessable. It is offered temporarily at a price which will make the investor a large and quick profit. This price is not to be permanent, and the company reserves the right to advance it at any time without notice. You can ascertain the present price from the party furnishing this folder, or, failing in that, upon application to the company.

"As soon as this method is in general operation, which will soon occur, this stock will readily be worth par and doubtless paying a large per cent upon a much higher valuation and become a wonderfully remunerative investment. It is notorious how very valuable such revolutionary discoveries have been and few have equaled the promise and scope of this one." .... GOLD EXTRACTION CO.,
St. Louis, Mo.

The Oil Fields of Kern County, Cal.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by H G. PARSONS.

SUNSET DISTRICT.—The Sunset oil district has been known as such for many years, and has received considerable attention at the hands of successive State Mineralogists or their field assistants. This has been because of ample surface indications proving the existence of petroleum. Besides oil springs, there were extensive deposits of asphaltum, and in late years a considerable quantity of petroleum has been taken from groups of shallow wells sunk by Jewett & Blodgett in the mesa lands near the asphaltum beds. The district is 40 miles southwest of Bakersfield, in the foothills of the Tehachapi mountains, which form the southern boundary of the San Joaquin valley. Prof. W. L. Watts gave an extended description of this district in a monograph published by the State Mining Bureau in 1894. Besides describing the geology and topography of the district, he ventured certain opinions, which are being verified by recent developments. He stated that there are evidences of two geological formations at Sunset, and that each would be found to produce an oil peculiar to itself. He located one formation in the first tier of foothills rising out of the mesa lands; the other in the hills farther to the southward. As has been intimated, this opinion has received confirmation through recent developments. An oil of greenish cast and of lighter grade than that taken from the first wells sunk in the district has been found south of the first tier of hills. Already several companies are operating in this vicinity, hoping to find the green oil in quantities that will compare favorably with the output of wells producing black oil in the northern part of the field.

Lack of transportation militates against the Sunset district at present. It costs heavily to get freight into the district over a stretch of 43 miles of sandy road. It is thought the building of a railroad will not be long deferred. A branch of the S. P. from Gosford, on the McKittrick line, was projected before there were many productive wells. Now that production has begun in earnest, so that the railroad will secure freight both ways, there will be every inducement for a speedy completion of the line. A large quantity of material for the road is now stacked up at Gosford.

Another disadvantage at Sunset is lack of potable water. The wells all yield salty or sulphurous water, entirely unpalatable. Drinking water is hauled from a valley in the mountains 12 miles distant, making it expensive. It is probable that as the district increases in importance this water will be piped to Sunset.

The interests of Jewett & Blodgett in the Sunset district are paramount. It is largely due to the persistent work of these gentlemen that the petroleum industry holds such a prominent place as it does in Kern county's history to-day. They erected asphaltum works at Sunset eleven years ago, and followed this by sinking oil wells in adjacent mesa lands. They have always supplied a fine grade of asphaltum, and, when their present enlarging works are completed, they will manufacture an excellent article and a good deal of it. They have sunk over twenty oil wells in the Sunset district, nearly all of which are yielding. Their latest well, "No. 35," in the hills about 1½ miles southwest of the refining works, is probably the best producer in the camp. Besides owning much land in the district, part of which they have leased to other parties, they have leased additional lands, making them large factors in the development of this promising field. A description of the asphaltum works will be of interest:

Originally the company treated the crude asphaltum, which lay as a vast deposit on the surface of the earth. This product was melted in large vats, the impurities settled and the refined material was drawn off in a liquid state, leaving a sandy residuum which could be used as fuel. At present, asphaltum is manufactured from crude petroleum taken from the Jewett & Blodgett wells, or purchased from other wells in the district. It has been found that this plan is superior to the refining of crude asphaltum taken from the hillsides. The present works are modeled after those at Baku, Russia. Retorts have been placed which will dispose of 350 to 400 barrels per day of crude petroleum. Superheated steam under pressure is injected into the petroleum in these retorts. This agitates the vapors and they pass off at a less degree of heat than would be necessary if the fluid were heated over a firebox. Asphaltum heated above 400° F. will be destroyed by disintegration. The distillate which is condensed from the petroleum vapors is itself valuable, selling at present for 8 cents per gallon and containing 18% of a rich lubricating oil. This, however, must be extracted by a further process. The residuum which is drawn out of the retorts after the distillation is finished is 90% pure asphaltum. Such foreign matter as still inheres is of positive advantage, being infusorial earth that toughens and strengthens the product. This asphaltum, after being hauled by team over a long road to Bakersfield, is shipped to Eastern markets, where it has to compete with asphaltum brought from Trinidad, W. I. If the Sunset product were not of superior quality, the West India asphaltum would crowd it out, as cheap ocean transportation and a short haul by rail would be factors hard to combat. The General Electric Co. of Schenectady, N. Y., The Gilsonite Paving Co. of St. Louis, Mo., and Chicago, Ill., roofers are regular purchasers of Sunset petroleum. There is no trouble to find a market for all which may be manufactured. The crude petroleum of this district, specific gravity 12° B., will yield 50% asphaltum, manufactured as above described. The engraving on the front page gives a good idea of the appearance of the district.

Development work in the Sunset district has been stimulated by the operations of Easton & Eldridge, who manage the affairs of several companies.

Sunset King, on Sec. 10, 11–24, down 900 feet, with a little showing of oil, propose to go deep. Manhattan, on Sec. 11, 11–24, down 800 feet, are after the same sand as the Sunset King. Sunset District, on Sec. 3, 11–24, now rigging up. Bonita, on Sec. 3, 11–24, has just begun spudding. The Sunset Czar, on Sec. 19, 11–23, now down 460 feet and capable of producing, after perforation of casing, twenty barrels of oil per day. Sunset Petroleum & Refining Co., on Sec. 29, 11–23, down 100 feet, have had a showing of oil from near the surface. Sunset Consolidated, on Sec. 28, 11–23, down 300 feet, now putting in casing.

The Monarch Oil Co. of Arizona was the first company to strike oil in the hill section at Sunset. Their productive wells are on Sec. 2, 11–24. The first stratum of oil sand was struck at 385 feet, the second at 440 feet; the latter is 65 feet thick, but very rich in oil. Wells Nos. 1 and 2 are producing, but both are troubled with sand, which prevents steady operation of the pump. It is thought 100 barrels per day for each well will be a conservative estimate of the output after these wells are able to pump regularly. The Monarch supplies many other outfits with oil, sending it as far as to the Bay City, in the Midway district, 12 miles toward McKittrick.

There are several wells with bright prospects in the immediate vicinity of the Monarch. "No. 35," belonging to Jewett, Blodgett & Beal, has already been referred to. It is on Sec. 35, 12–24. It is producing as much as Monarch No. 1 and presents exactly the same characteristics. The Occidental Oil Co. of West Virginia are reaching a good depth in their well, on Sec. 2, 11–24. A strong odor of gas is observable. The Arcola is in the same vicinity. The rig is ready for operations, but matters are delayed by legal complications and scarcity of casing. At the Golden Gate, which is on the flat, southeast of the Monarch, a small stream of oil is pumped from the well, probably amounting to ten barrels per day. The Pittsburg, also on the flat and half a mile east of the Monarch, is closed down for lack of casing. The Superior, on Sec. 7, 11–23 (on the flat), has good indications at 600 feet. The Barrett well, on Sec. 11, 11–24, obtained oil at 1400 feet, but the oil production gave out and the well is now yielding water as salty as that from the ocean. This repeats the experience at Jewett & Blodgett's No. 17 well. The latter was a spouter of oil for several weeks, but it now produces water carrying some oil. Another of Jewett & Blodgett's wells on the flat supplies water for most of the boilers in the camp. The water is less salty than that coming from other wells, but is strongly sulphurous. The U. S. Oil Co. are sinking a well with good prospects on Sec. 26, 12–24, a short distance west of the J., B. & B. well on Sec. 35. Wheat & Wilson are putting up rigs on promising territory, Sec. 3, 11–24. The Lion Oil Co. have excellent indications on Sec. 12, 11–24. As their property is located a little distance from the hills, operations are watched with keen interest. They are now down between 600 and 700 feet. The Sunset Queen, the State Crude and the Queen Esther, all in the second or third range of hills, are thought to be in safe territory.

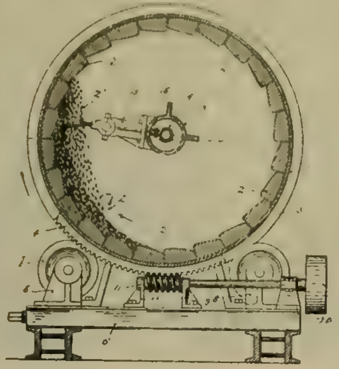
There are many wells being sunk northwest of the Monarch and "No. 35," but as yet this group is the farthest of productive wells in that end of the field. In the southeastern part of the field the Navajo and the Sunset Czar are both productive. The former is in rich oil sand at 600 feet. They sold 300 barrels of oil to other companies during September. These wells are in the first range of hills and are located diagonally across three sections of land from the Monarch. Thus the oil field at Sunset has a demonstrated length of 4½ miles. The early wells of Jewett & Blodgett, which are producing limited quantities of oil from shallow depths, lie on mesa lands in a straight line between the more productive extremities in the hills. The question now seems to be whether the rich oil belt at Sunset bends to the south, corresponding to the conformation of the hills, or whether it crosses the flat. This question will soon be determined by the operations of companies now sinking wells in both localities.

Mining and Metallurgical Patents.

Patents Issued October 30, 1900.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

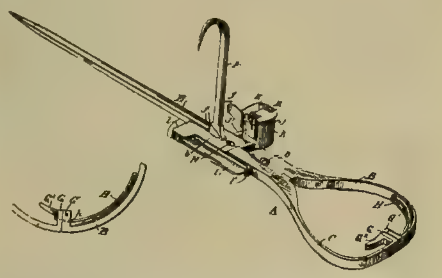
METHOD OF TREATING REFRACTORY ORES.—No. 660,173; J. C. Teller, Minneapolis, Minn.



Method of treating refractory ores, placing body of pulverized ore within tubular shell, rotating shell with such velocity as to cause successive portions of ore to be carried upward past horizontal plane, passing through axis of shell, whence they fall in free shower of separate particles, and projecting flame through falling particles.

◆

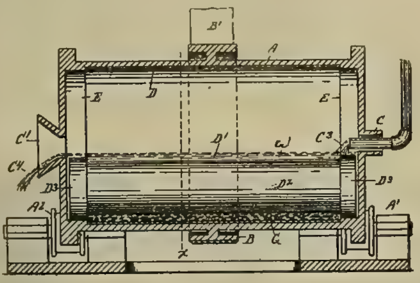
MINER'S CANDLESTICK AND COMBINATION IMPLEMENT.—No. 660,573; F. Herbst, Ouray, Colo.



Combination with miner's tool having pivoted jaws, of detachable candle support adapted to be confined in jaws, handles on jaws, means for locking jaws together comprising dog having squared bottom end pivoted to one member and adapted to engage opposite member, a spring adapted to engage bottom or end of dog to hold same in closed or open position.

◆

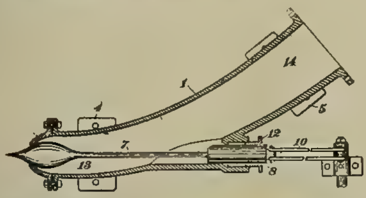
AMALGAMATOR.—No. 660,774; H. Hicks, Fort Wayne, Ind.



Amalgamating apparatus, combination with rotatable tank having surface coated with mercury, means for rotating tank rolling amalgamator having surface coated with mercury arranged within tank spaced therefrom intermediate of its ends caused to be set in rolling motion by rotation of tank, rolling amalgamator constructed with annular laterally projecting treads to raise rolling amalgamator from contact with inner surface tank.

◆

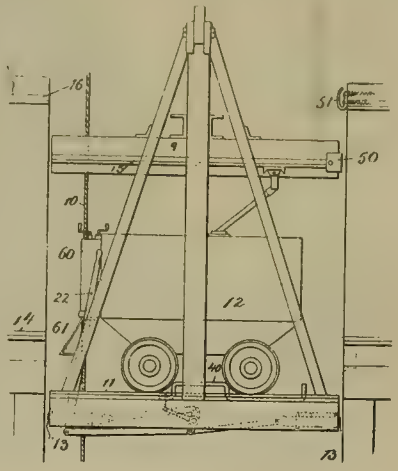
HYDRAULIC REGULATING NOZZLE.—No. 660,789; W. A. Doble, San Francisco, Cal.



Hydraulic regulating nozzle having discharge end converging on curved lines, movable spindle-shaped core piece mounted therein projecting through discharge end, adapted to open and close same, permit annular discharge of water therefrom on lines tangential to inner curved faces of nozzle end and anterior curved faces of central core, in combination with hydraulic balancing piston connected to core by flexible rod or stem, means to operate piston and core.

◆

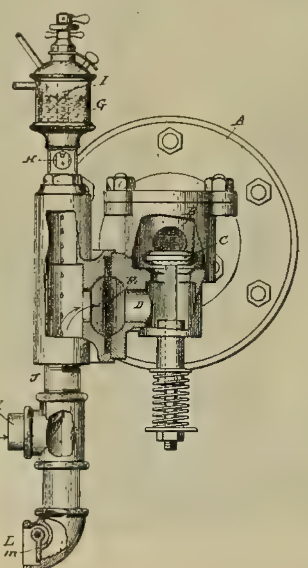
ELECTRIC CONVEYING AND ELEVATOR APPARATUS.—No. 660,724; G. K. Fischer, Salt Lake City, Utah, F. Klepetko, Great Falls, Mont.



In combination with rails and trolley conductors, of electric railway, elevator car having corresponding rails and trolley conductors, locking mechanism for elevator car and electric tram car having manual controller adapted to be run onto elevator car, manual controlling devices for locking mechanism and for operating elevator car being set in juxtaposition to normal position of controller of tram car when tram car is in place on elevator car.

◆

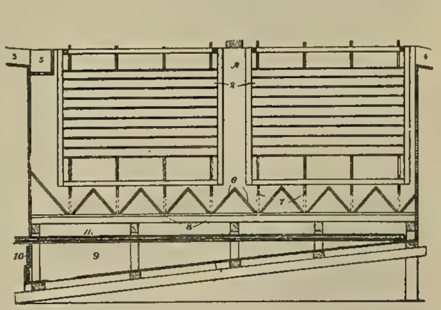
MIXER AND VAPORIZER FOR GAS ENGINES.—No. 660,778; J. W. Lambert, Anderson, Ind.



Combination, gas engine cylinder, inlet valve, mixing chamber connected thereto by lateral passage, feed device adapted to feed gasoline into upper end of mixing chamber so that gasoline will fall unobstructively through same, air inlet pipe connected to mixing chamber at its bottom, directly beneath feed device, so that inward current of air will be directed upward against falling gasoline and unvaporized gasoline will fall directly into air pipe; pipe to carry off unvaporized gasoline provided with outwardly opening valve adapted to be held closed by suction.

◆

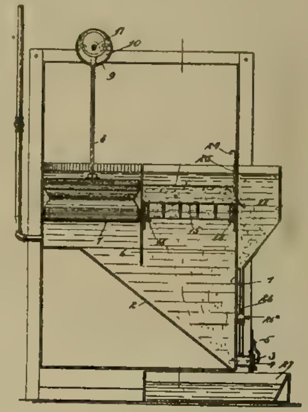
DEVICE FOR COLLECTING FINELY DIVIDED MINERALS AND SLIMES.—No. 660,844; W. E. Darrow, Sonora, Cal.



Apparatus for separating finely divided mineral from heavier gangue consisting of stationary tank or space having surfaces inclined toward longitudinal sides of tank so that heavy material will slide therefrom and lighter material will collect thereon, means for supplying water from below to fill tank and submerge surfaces, means for supplying material to pass through tank and over surfaces, discharge at opposite end, transversely corrugated or channeled bottom having openings therethrough and closed receptacle beneath filled with water whereby heavy sediment gradually passes through openings into lower compartment without agitation in upper compartment.

◆

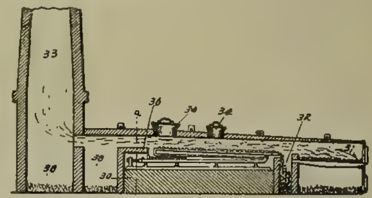
SLIME JIGGING MACHINE.—No. 660,869; C. B. Rogers, El Paso, Tex.



Slime jigging machine comprising two-compartment tank having bottom portion consisting of horizontal section, intact, substantially V-shaped base extending from horizontal section to opposite side wall of tank having continuous, uniform inclination, suitably shaped, upwardly flaring side walls; plunger in one tank compartment above horizontal section, screen in other tank compartment; bridge wall located immediately at one end of screen terminating short of top of tank; valved receptacle located exteriorly to tank adjoining bridge wall, walls projecting above outlet leading from lower extremity of bottom portion, means for controlling outlet; tank divided into two compartments by vertical transverse partition terminating at lower extremity short of base below plane of hortizontal bottom section.

◆

HEARTH FOR ROASTING ORES.—No. 660,982; G. Clary, Zacatecas, Mexico.



In an ore roaster, plate, plurality of rollers carried by plate, frame mounted upon rollers, table carried by frame pivoted at one end thereto, means carried by plate for moving frame rearwardly, separate means for moving table forwardly, means for raising and lowering free end of table.

◆

ART OF HARDENING AND TEMPERING COPPER, GOLD OR SILVER.—No. 660,983; D. E. Conner and O. Bagby, Covington, Ky.

Of hardening non-ferrous metals, first cooling same to a temperature at least 50° below zero F., then rapidly heating them to a temperature of at least 1000°, F., first placing them in liquid air, then rapidly heating to the stated temperature; cleaning and annealing metal treated by heating and immersing it in cold brine.

Some Colorado Metals.

Baily & Monnig, who give attention to the handling of some of the rare metals, state that almost 100 tons uranium oxide, associated with vanadium, have been shipped from the Dolores river, or Paradox valley region. The ore is somewhat siliceous, being found in a stratified sandstone section. Some of the shipments ran as high as 30% uranium. The three Gilpin county mines which are producers of this metal are at present closed down. The production of about 500 tons from the three mines ran about 15% to 20%.

Within the past year a few cars of metallic bismuth have been shipped from Leadville, the most of which ran about 8% pure, but also carrying gold and silver. The Leadville bismuth occurs as an oxidized ore, being found in streaks running through bodies of other oxidized ore and the streaks bearing it are stripped and sorted from the other material.

Many samples of cobalt, nickel and tin are frequently received by Baily & Monnig, but seldom in quantities to be handled.

The discoveries of large bodies of tungsten in Boulder county have attracted much attention among those who handle that class of material, which is made use of in hardening and toughening steel.

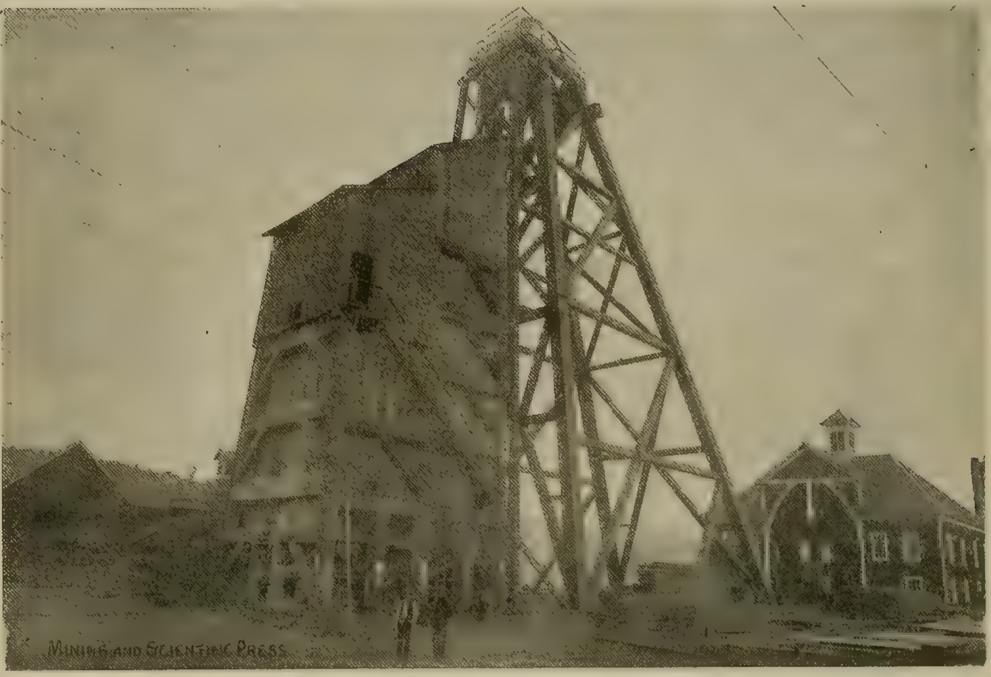
Denver, Nov. 2. WASCOTT.

The Cross Shaft, Angels, Cal.

Written for the MINING AND SCIENTIFIC PRESS by S. A. HOFFMAN.

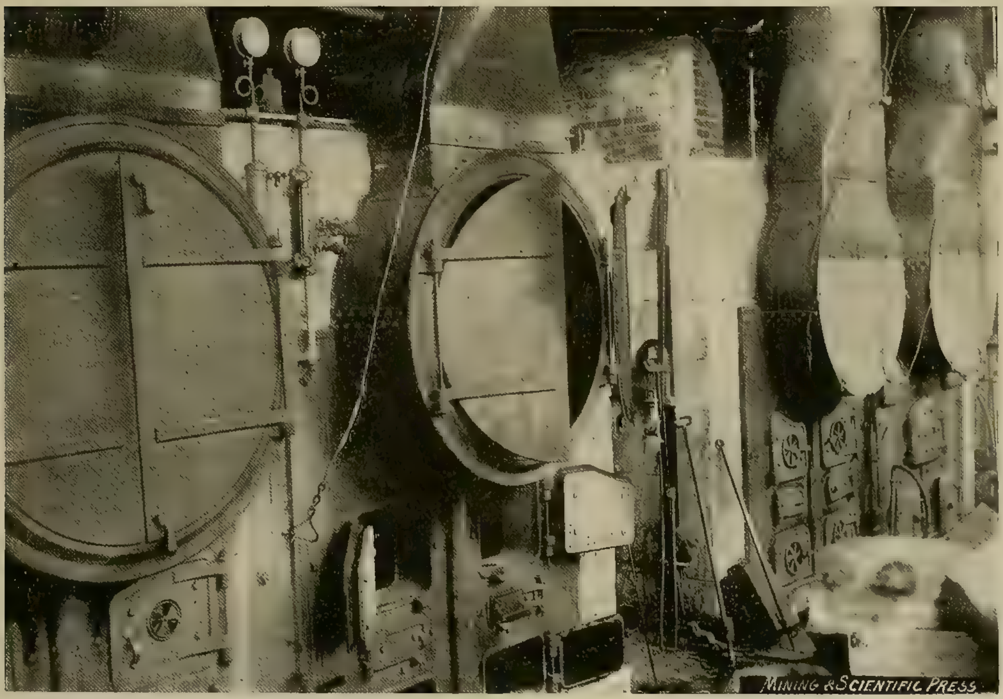
The machinery for this shaft was furnished by the Union Iron Works of San Francisco. The engines are of the pocket valve type. It is also fitted with water power, which will be used most of the time after the winter rains set in. The cylinders are 24x60 inches. The engine is direct acting.

The water wheels (two) are of Pelton make, each 10 feet in diameter, using 500 inches of water from running head of 380 feet, delivered through 26-inch steel riveted pipe. The reels are of the cone pattern, holding 1935 feet of 1⅛-inch plough steel cable—seventy-five coils round the cone. The reels are fitted with the Lane brake and are detachable; they can be used separately. The diameter of the cone at the largest end is 9 feet 11 inches, center to center of rope; the smallest end is 6 feet 6 inches.



Hoist and Engine House, Cross Shaft, Angels, Cal.

The crank disks are 9 feet in diameter, fitted with strap brake, operated by hydraulic cylinder. The diameter of the brake wheel on the reel is 13 feet 6 inches, with 12-inch face, fitted with double-acting post brakes, operated by steam. Total weight on three bearings which the reels rest on is eighty-five tons. Total length of reel shaft and crank shaft, 37 feet 2 inches, made in Bethlehem, Pa., forged steel, 15 inches in diameter, with a 6-inch hole full length through it. It is coupled in the center with forged steel couplings.



Boilers for Cross Shaft, Angels, Cal.

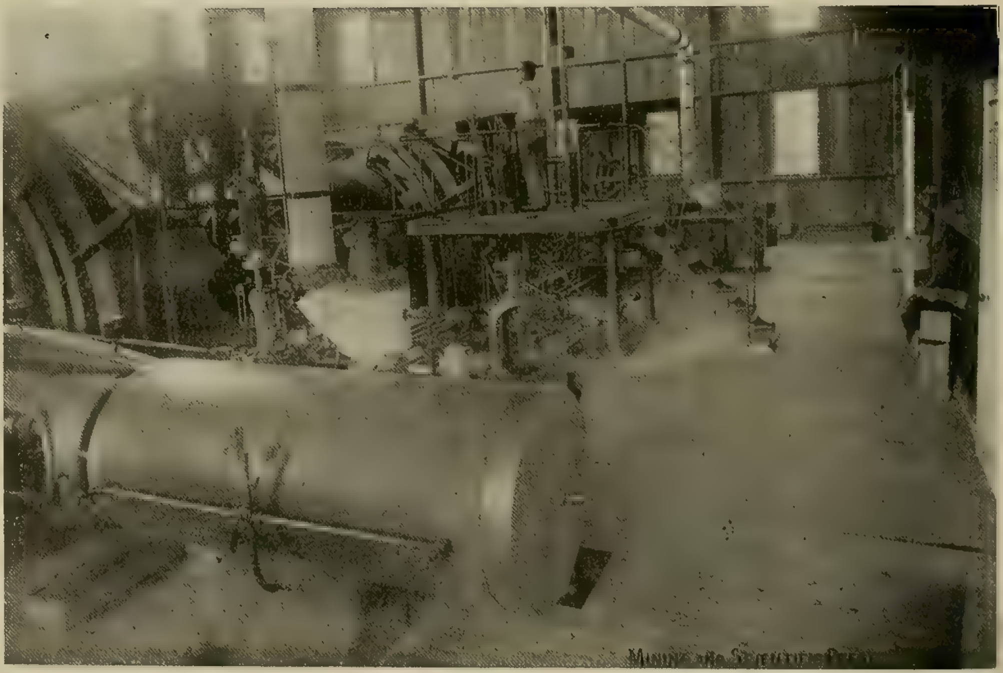
The engine is operated on a raised platform 5 feet high, 8x8 feet square. The machinery is on a concrete foundation, built of crushed quartz, 12 feet deep, and is anchored down with eighty-eight anchor bolts, each 2½ inches in diameter, 12 feet long. The foundations are 42x65 feet. This machinery will carry a skip, holding 1500 gallons of water, 1400 feet, making the round trip, fill the skip and dump it, in two and one-half minutes.

The gallows-frame has two sheave wheels, each 12 feet in diameter, solid cast iron, running on 6-inch shafting. The top of the wheels is 106 feet; top of frame 96 feet. This frame was designed by engineers of the Union Iron Works, and was raised and framed on the ground here by the Utica Co. It is built of 24x24-inch pine, having four posts. It was designed from the Eiffel tower pattern. The posts are spliced in the center.

The steam for the engines is furnished by four boilers of 75 H. P. each, of steel $\frac{5}{16}$ inch thick, with head ¾ inch. Each boiler has sixty-two 3¼-inch flues. Each boiler is 14 feet by 5. The total cost of this engine and hoist was $75,000. The time required from time of starting foundation to time of running was six months. The total weight of lift, loaded, is nine tons.

The Cross is a three-compartment shaft and is not worked above the 700 level. The shaft is 1400 feet deep.

For the above information I am largely indebted to Jno. Ellis, who had charge of the building of the foundations, and who has general supervision of the machinery now.



View of Engine Room, Cross Shaft, Angels, Cal.

ALUMINUM is incorrodible indoors. It is almost incorrodible in the outside atmosphere. When exposed to moist air a slight harmless oxide of alumina is formed, discoloring it a little, but protecting it from further corrosion. Steam and flue gases, ammoniacal vapors, any of the acids, strong or dilute (except hydrochloric acid slightly), do not affect it in any way; the alkalies alone affect it, hot caustic soda solution dissolving it very quickly. Its tensile strength is a little less than that of copper, diameter and length being equal; but, weight for weight, aluminum has nearly three times the tensile strength of copper. It is being used largely by American electrical engineers as a bare and insulated conductor for telephone and telegraph wires, and for power, etc. It is now used as a trolley wire and by electrical firms for commutators on account of its light weight and non-magnetic and non-sparking properties; for brushes and brush holders, switches and cut-outs, for the same reason.

Pennington & Sons' Steel Works.

On the front page is a view of Pennington & Sons' main steel works, San Francisco, in which are shown four steam hammers—one small, one medium and two extra large. The combined striking power of this collection, added to that operated in their branch works, compares favorably with any similar plant west of the Mississippi river. This firm makes a specialty of forging either iron or steel as desired. They turn out forgings ranging in weight from one pound to 30,000 pounds. Of their various manufactures their hammered steel shoes and dies, known as the "Pennington," are best known. Next in importance comes their shafting of all kinds, used mainly in the construction of ships, engines, automobiles, etc. Recently they have added a department for the manufacture of well boring tools.

MINING SUMMARY.

ARIZONA.

COCHISE COUNTY.

The Lake Superior & Western Co., operating near Bisbee, will put in a new hoist.

GILA COUNTY.

Phelps, Dodge & Co. are credited with intention to build a smelting plant at Globe to treat ores from their copper mines at Nacosari, Sonora, Mexico, and at Bisbee, Globe and Morenci.

MOJAVE COUNTY.

The telephone line from Chloride to the Connor and Minnesota mines, thence to the Merrimac, 5 miles, has been put in operation by the Philadelphia & Arizona M. Co. The company is putting on more men, and it is expected that by Jan. 1 they will have 200 men at work. Level connecting the two 400-foot shafts, a distance of 26 feet, is about completed, and timbering is now in progress.

W. Van Ansdal is down 100 feet on his claim near Chloride.

J. Priske is getting out ore from the Home Pastime, Mineral Park, for shipment to the Globe Smelting & Refining Co., Denver, Colo.

The Occidental, White Hills, has 100 men sinking, drifting, etc. The company also has many men working on other claims in same vicinity.

W. H. Lake of Kingman has ten men doing development work on claims near Kingman. He is connected with Philadelphia parties in the old Jumbo, and they may reopen mine during winter.

The Fay group, near Pyramid, is being developed by Los Angeles, Cal., men. Ten men are working and ore is being sacked for shipment.

Work at the Sheeptrail is progressing.

J. Hughes and F. W. Mitchell expect to put men on at the Fraction.

PIMA COUNTY.

At the Old Liberty, 40 miles south of Tucson, a strike has been made on the 71-foot level, showing 600 ounces silver, 30% lead and 4% copper per ton; W. R. Wemple manager.

G. Metz, on the Condon properties, Old Hat district, has twenty men working.

PINAL COUNTY.

C. E. Udall, manager McGorris Copper M. Co., has twenty-five men at work on the San Pedro, near Mammoth. Ore shows 20% copper and fifty ounces silver to the ton.

It is expected that upon the reopening of the Ray mines, near Florence, on the 15th inst., 175 men will be given work.

YAVAPAI COUNTY.

W. F. Staunton, manager Congress (gold), near Congress, is reported considering erection of 40-stamp mill and cyanide plant there.

L. C. Haynes and J. G. McBride of New York have bought the White Horse group, 7 miles from Prescott, for $25,000.

C. Harryhouser is pushing work on the Harryhouser group, near Jerome. Three shifts are working and sinking has been done to a depth of 325 feet. The group is bonded to Eastern men, who contemplate thorough exploitation.

YUMA COUNTY.

Ore from the Goodenough, Tison Wells district, 25 miles east of Ehrenberg, is reported to carry 15% copper and fifty ounces silver per ton. Development work on drifts and shafts aggregates 15,000 feet at present and development is in progress.

CALIFORNIA.

AMADOR COUNTY.

W. A. Pritchard, Supt. Keystone, near Amador, is sinking a single-compartment shaft at the mine.

The forty stamps at the Zeile, Jackson, are dropping. Work at the Central Eureka, Sutter Creek, is progressing. At the Bellwether a small mill has been put in. Sinking on the Kirkwood, Jackson, will begin as soon as new engine is placed. The Altaite M. Co. has bought the Nome, Amador, and will develop same.

Work at the Mutual mines, Sutter Creek, Supt. Porter, will resume. At the Oneida twenty-five stamps are dropping, being run by water power. It is expected that within a month, however, sixty stamps will be run by electric power.

CALAVERAS COUNTY.

The Lloyd, San Andreas, has resumed after a few weeks shut-down.

Upper plant of the Standard Co. has suspended temporarily.

Operations on the Vorlander, at Middle Bar, have resumed.

H. A. Guffey, of Fresno, who some time ago bonded the Tulloch-Magruder, Angels, has opened up lode on 300-foot level 11 feet in width, carrying sulphuret averaging $12 per ton; W. H. Bravin, Supt.

EL DORADO COUNTY.

Good ore is being taken from the Mt. Pleasant, near Grizzly Flats, on 800-foot level.

HUMBOLDT COUNTY.

H. C. Morse of Eureka has leased twenty acres gold-bearing sand beach at Little river and will put up a plant to save the gold.

KERN COUNTY.

The McWhorter Oil Co., capital $200,000, is incorporated at Bakersfield. Directors, M. McWhorter, J. H. Moss, G. B. Okerlund, J. C. Schiffer and A. Von Kuehlen.

It is thought that there is at present a demand and a market for 10,000,000 barrels of oil in California alone.

The Chino Land & Water Co. has abandoned its well in Fullerton extension at a depth of 1100 feet. They will sink another well.

The Continental Oil Co. has completed its second well, is down 180 feet on the third, and has a derrick up on the fourth.

The Carbon Canyon Oil Co., in Fullerton district, has struck oil and a flow of gas at a depth of 520 feet.

The Old Dominion, near McKittrick, will drive a 2500-foot hole.

The Navajo No. 1 produces fifty barrels oil per day.

The Green Whittier Oil Co., capital $1,000,000, is incorporated, to work near McKittrick.

MARIPOSA COUNTY.

(Special Correspondence).—The Francis M. Co., near here, has about completed the erection and installation of a 10-stamp mill. It will be ready for operation by the 20th of November. J. L. Madden, formerly of Amador county, is manager of the Francis property.

Cathay, Nov. 4.

NEVADA COUNTY.

The Phœnix, Nevada City, will resume.

The Crystal Lake G. M. Co., office at Benicia, will operate in the old Meadow Lake district.

The Union reports the uncovering at the Coe mine of a ledge with gold sprinkled all ovr the outere edges.

The Banner mine, Nevada City, Phillips Bros., owners, is again producing ore, tributers being at work there. The mine has been pumped out and everything found in good shape. Forty tons ore will be shipped to Selby's, San Francisco, and if returns are satisfactory, work will be pushed.

PLACER COUNTY.

The Mammoth Bar, near Auburn, has closed down for winter.

The Lincoln Oil Co., it is reported, will drill 3000 feet on its property, consisting of 1260 acres patented land near Lincoln.

W. C. Giles, Supt. Fairview quartz mine, 16 miles southeast of Cisco, has eight men employed on development work.

The 10-stamp mill at the La Trinidad mine, 16 miles southeast of Cisco, is running. The first cleanup since the resumption of work gave 92 ounces; G. S. Montgomery Supt.

The Rawhide Co., Auburn, are putting in 1200-foot tramway.

The Pioneer, Supt. Sullivan, has resumed.

Pay Streak mill, Humbug canyon, W. Lovelace, Supt., is running.

Colfax Sentinel: The new 8-stamp mill at the Girard quartz mine is completed, 7 miles west of Cisco, E. R. Edwards Supt.

PLUMAS COUNTY.

The Rich Bar M. Co., Quincy, has suspended operations for season.

Work on the Talbot, Lights canyon, is progressing.

RIVERSIDE COUNTY.

It is expected that Manager Segapno of Perris, who was given a decision in the Good Hope mining suit, will begin development work soon.

The Indian Queen, M. J. Andrews manager, is pushing work. A stamp mill, boiler, hoist and engine are in place, ready to run.

The Perris, owned by W. F. Bray, is reported bonded to Los Angeles men, who intend to begin operations soon.

Ore from the Washington, F. Bates manager, is said to mill better than $60 to the ton.

SACRAMENTO COUNTY.

The steam shovel put in at Teet's Flat, near Natoma, did not prove economical in handling gold gravel deposit, owing to depth. It is understood that a dredger will soon be built to replace it.

The Mississippi Bar dredger is undergoing repairs.

SAN BERNARDINO COUNTY.

Copper ore has been discovered at the Copper World mines, Valley Wells. Supt. Ritchie says he will give employment to fifty men.

SAN DIEGO COUNTY.

Julian reports the finding of the original ledge of the Stonewall mine at Cuyamaca by Jones, Stambak, Crane & Mueller.

The Oceanside Oil Co., Oceanside, has struck an oil vein at a depth of 620 feet.

The Victoria Oil Co., Pres. Woodward, is putting up new rig near La Costa.

The La Jolla Oil Co. will begin drilling.

SHASTA COUNTY.

It is locally reported that the Copper M. Co., Keswick, will put in additional furnaces and a new plant for treatment of low-grade ores.

SIERRA COUNTY.

(Special Correspondence).—The California-Idaho M. Co., Ltd., an Idaho company, has begun the driving of a tunnel to tap the Pliocene gravel channel, 1 mile north of here; W. W. Miller is Supt.

Pike, Nov. 1.

SISKIYOU COUNTY.

C. R. Weigel of Hungry Creek realized $100 from a 10-ton test of ore from the Sterling, Hornbrook.

The Money Maker Co.'s mill is running on $40 ore.

Hicks Bros., on China gulch, have a 4-inch stringer of $75 rock. They are in on it 100 feet.

A recent clean-up at the Jillson weighed eighty-five pounds after melting.

TRINITY COUNTY.

At the Lecompton mine the ledge is 2 feet thick and shows free gold and galena. The mine has been bonded to San Francisco men.

The new 10-stamp mill at the Brown Bear mine at Deadwood has started. Supt. Dobler is driving for the ledge in the lower tunnel. The new mill will be run on ore from the old workings.

TUOLUMNE COUNTY.

Lower Triumph tunnel, Carters, is in 55 feet on vein, latter carrying pay streak 2 feet wide. A hoist may be put up and sinking started.

At the Goldwin sinking is resumed.

A station is being cut and chute put in at 400-foot level of the Dreisam, near Jamestown; when completed, drifting will begin. Owing to inflow of water, drifts will be driven by hand drilling until shaft is unwatered.

The Jumper, near Stent, has resumed. Shaft has been retimbered from 600-foot level to near surface.

At the Phillips, near Ward's Ferry, tunnel is in 380 feet; a crosscut shows ledge to be 17 feet wide.

Thirteen men are employed at the Holmes.

The Spring Gulch, near Carters, will put in 60 H. P. engine and tramway.

The 20-ton cyanide plant at the Densmore, Jamestown, is completed. Main tunnel is in 500 feet.

Pease & Colby are pushing work on the Fleming, near Algerine. G. &. W. Smith & W. Sherer of Stockton have leased portion of the Fleming and will begin development. The Shawmut Co. will use oil as fuel in their new chlorination plant. J. Fisher, Pres. Golden Gate mine, Angels, says that twenty stamps will be added to mill, and that the chlorination plant will be enlarged, etc. The company has been reorganized and capital stock increased to 800,000 shares. A few men are working at the Manhattan of High Point M. Co. The new 10-stamp mill at the Willietta, Jacksonville, may be run with oil as fuel. Exploiting work at the Uncle Sam, near Arastraville, has stopped and machinery has been taken out.

COLORADO.

BOULDER COUNTY.

(Special Correspondence). — The Wall Street G. M. & M. Co., composed of Providence, R. I., people, is reported to have subscribed $125,000 to be expended in erecting a custom reduction plant at Wall Street, in which Robinson & Greenawalt's electro-chlorination process will be used.

Ward, Nov. 3.

The new shaft on the Chief Big Finger, Ward, is down 75 feet, and in the new drift 3 feet of milling ore shows.

A 6x8 4000-pound steam hoist, Vulcan pattern, and 30 H. P. boiler will be put in on the Apex group, on El Dorado mountain, M. Brooks manager. Two shifts will be put on and work will be pushed. Work on a 45x24-foot shaft house is in progress.

At the Silent Friend, Ward, sinking of the main shaft, driving of tunnels, etc., are being pushed.

CLEAR CREEK COUNTY.

(Special Correspondence). — The Colorado & California Share Holders' Co., under the management of W. H. Knowles, is milling fifty tons per day and shipping fifty to seventy-five tons per month of crude ore to the smelters, all from the Crown Point & Virginia mine, and 250 to 300 tons of concentrating ore from the Franklin mine. This company operates the Wilkie stamp mill and the Allen concentrator.

Shipments of ore are being made from veins opened by the Newhouse tunnel in ground under the Gem Extension workings, the latter being controlled by Idaho Springs parties. The extension of the great tunnel continues.

The Sun & Moon mine is sinking a shaft to make a connection with the Newhouse tunnel.

The Seaton mine employs fifty men. On this property considerable new work is in progress and exterior improvements have been made. The production has been increased and there is said to have been an improvement in the ore values.

Idaho Springs, Nov. 1.

(Special Correspondence). — A 400-foot upraise from the Knickerbocker tunnel to the bottom of the Emerson shaft has just been completed, and is regarded an interesting and intricate piece of work. The shaft, which was 400 feet deep, was badly caved and held considerable water, preventing co-operation through the shaft with work in the upraise. The upraise was made by hand drills, was well timbered as the work progressed, stations were made at each 100 feet, and the upraise struck squarely the base of the shaft and the connection was safely made. The work was done under the direction of Bert Ventress of Idaho Springs.

Idaho Springs, Nov. 5.

Ore carrying gray copper is reported to have been struck on the Tom Crowin, Astor group, near Georgetown.

CONEJOS COUNTY.

The sale of a group of claims for $60,000 is reported from Greyback mountain, to a company of Illinois men. J. Gandy says the company will ship ore and construct buildings, roads and a tramway to Greyback gulch.

EL PASO COUNTY.

Sinking is in progress on the Last Dollar, near Colorado Springs. A new $30,000 plant is completed and work will be pushed. It is reported that the company may declare a dividend.

FREMONT COUNTY.

The engine, pump and generator at the Union, Florence, are running. Work on the Rocky Mountain smelter is progressing.

The new plant of the Union Extraction Co., Florence, is completed and running; W. B. Milliken, general manager. The plant cost $300,000.

GILPIN COUNTY.

At the Pittsburg–Meeker, Central City A. Campbell Supt., a good strike of yellow and gray copper ore has been made in 400-foot level.

One hundred and fifty men are working at the Cook, and shipments of ore average between 250 and 300 tons per day; C. R. Colvin manager, W. Jelinek Supt.

At Central City the Cook, on Bobtail hill, has 150 men working. Daily production is from 250 to 300 tons. The ore is hauled bp electric motor to the new mill at Blackhawk.

The Fisk has fifty men working.

The Hamlet, on German mountain, near Central City, is leased. The lessees will begin development.

Sinking on the Daisy will be resumed.

Ore carrying a good percentage of gray copper and peacock iron has been opened up in the bottom levels of the Pittsburg–Meeker, Russell district.

The Running Lode, Blackhawk, Manager Dunstone, will begin sinking about Dec. 1st. Thirty men are employed.

M. Rosetti is driving a tunnel on the Busy Bee, Apex.

The following are incorporated: Cleveland Deep Tunnel Co., capital $50,000; Metal Miners' Corporation, capital $500,000; Boston & Denver Con. M. & M. Co., capital $5,000,000.

H. J. Stephens is pushing development on the Queen of the West, in Chase gulch, on the third, fifth and seventh levels.

The Cayuga Lake M. Co. is in 875 feet in its Advance tunnel; F. Owen Supt.

The Robert Emmett, on Maryland mountain, will resume.

Two shifts are working at the Virginia, Chase gulch. The shaft will be sunk to the 500-foot level. Drifting is progressing on the 400-foot level.

Ore from the Wautauga, Russell Gulch, is being hauled to Idaho Springs for concentration. Daily shipments average forty tons. Thirty-eight men are working on day and night shifts and more men may be put on soon; Supt. Clayton.

At the Pocahontas drifting is being done on the 300-foot east and west levels and on the 100-foot level.

Hall & Co. are down 40 feet on the I. X. L., in Russell district.

The new Boston & Denver Con. M. & M. Co. is the successor of the old Boston

& Denver M. & M. Co., and will succeed the latter in the management of the Gregory–Bobtail and Cook mines consolidation, and of the new Boston & Denver 80-stamp mill at Blackhawk; also of the Fish and Puzzle mines on Gregory mountain.

GRAND COUNTY.

The tunnel of the Colorado Fuel & Iron Co., Fierro, is in 400 feet. Three shifts are sinking at the Emma, Fierro. Progress is slow, however, on account of unusually hard ground. Works have been inclosed for winter operations and two pumps are kept running. Sinking is resumed on the Modoc group, Fierro, Supt. White. Twelve men are employed. McCargo & Henderson are putting in a whim at the Heartburn, Fierro, and will push work. The steam hoist at the Iron Head, Fierro, Gilchrist & Dawson operators, is completed. A spur to connect the mine with the Santa Fe branch near Anson S. bridge will be built.

GUNNISON COUNTY.

A strike of lead ore was recently made at the Climax, at the head of Cement creek, near Gunnison. Ore is steel galena, running 60% lead, 20 ounces silver and $2 gold per ton.

LAKE COUNTY.

(Special Correspondence).—The Iron-Silver mine, under the superintendence of T. E. Schwarz, is shipping from 5000 to 6000 tons of crude ore to the smelters and milling about eighty tons per day of the zinc-lead-iron ores by concentration. The zinc ore exports from this property amount to 200 to 500 tons per month. At the Stevens shaft, on this property, sinking and prospecting with diamond drills are in progress.

Leadville, Nov. 3.

No. 2 Weldon will resume operations this month. The surface plant at the A. V. is about completed and sinking will probably be started soon. Manager R. Harper is working six men on the Hall shaft of Crown Point property and is shipping twenty tons iron and two and one-half tons ore. At the Toledo shaft the lime rock has proven so hard that 225 drills per day are required to make headway. Average drive per day is 2½ feet. Shaft is down 230 feet. It is reported that the Vielle Montaigne Smelting Co. of Antwerp, Belgium, will erect a reduction plant on the Arkansas river somewhere between Leadville and Pueblo. Conservative estimates give 250,000 tons available argentiferous blende ores on dumps in and around Leadville.

Henderson & Munro are crosscutting on the Quaker City group, Leadville. Two new furnaces of Boston Gold-Copper Co. are under way and buildings will soon be completed. Manager Bailey, of Bailey G. & S. M. Co., is pushing development on Mt. Massive.

At the California Gulch, Leadville, drifts are now advanced north, south and west from 550-foot station. Cost of shaft up to date about $85,000. While the pumping plant is capable of handling 1000 gallons, mine is making less than 400. It is reported that another strike has been made in the Rubie. Drifting is in progress. Sinking in the Carbonate Hill property is in progress and will not be stopped until 600 feet is reached; a station is to be cut out at 540 feet and drift started westward. Shaft is down 450 feet.

The first motion hoist on the Wolftone is finished. The mine will be working next month.

A drift on the 426-foot level is being run on the O'Donovan Rossa and Arnold placer claims on Carbonate hill, Leadville.

Forty tons of good ore from the 660-foot level of the Fortune, on Little Ellen hill, are shipped daily.

Work on the 1100-foot level at the Small Hopes is progressing.

The Home Extension Co. is cutting a station and placing a pumping plant in position at the 300-foot level.

The Coronado M. Co.'s shaft is down 600 feet. At 50 feet farther is a known body of iron ore.

The new station pump for the Rialto Co., operating the Pyrenees, in Graham Park slope, is being put in position at a depth of over 1100 feet.

The report of the Marion Con. M. Co., Leadville, covering a period from 1894 to 1900, shows that 172,235.39 tons of ore were extracted, carrying an average assay value of 23.09 ounces silver per ton. At 62.02 cents per ounce, the average quotation for silver during the period named, gives a total value for the output of $2,466,482.78.

PARK COUNTY.

At the Sacramento, Fairplay, crosscutting is being continued and the vein is soon expected to be cut.

On the Big Seven the diamond drill has been driven over 300 feet below the bottom of the shaft, making a total depth of over 400 feet. The management will go down a few hundred feet farther.

PITKIN COUNTY.

Pumps from the old Argentum-Juniata, Aspen, have been put in on the 1060-foot station at the Mollie Gibson, in the same locality.

SAGUACHE COUNTY.

(Special Correspondence). — The San Luis Land & M. Co., purchaser of Baca grant No. 4, is erecting a mill which will be among the largest in the State, and is calculated that properties located on the grant and partially developed will furnish sufficient amount of ore to keep the mill operating. The company leases many of the mining claims of the grant to active miners.

Crestone, Nov. 2.

SAN JUAN COUNTY.

The five new boilers for the Gold King mill, Silverton, are about placed and it is expected that the new 80-stamp mill on Cement creek will be treating ores from the Gold King and the American within the next week or so. Pipe from the compressor to the drills, a distance of 1 mile, is being laid.

A night shift has been put on at the new Silver Lake mill, on Animas river, 2½ miles above Silverton.

Work on lower drift in the Daniel Webster is being pushed.

SAN MIGUEL COUNTY.

The Liberty Bell G. M. Co. is putting in forty additional stamps on its property near Telluride, making a total of eighty to operate, with a capacity of 250 tons of ore per day.

The cyanide plant of the San Juan Gold & Silver Recovery Co., capacity 200 tons per day, on Gold Run placer, is treating tailings from the Smuggler–Union and other mines, which have accumulated for the last fifteen years. In some places the tailings are 10 feet deep, and values run from $1 to $14 per ton. It is estimated that there are 300,000 tons on the property.

SUMMIT COUNTY.

It is thought that placers around Breckenridge, Blue valley, will be worked until the latter part of this month.

TELLER COUNTY.

(Special Correspondence).—The mines of the Vindicator Con. G. M. Co. produced, within the months of July, August and September, 1900, a total of 7545 tons of ore, the gross returns for which amounted to $239,150; freight and milling charges were $77,885, leaving net milling returns amounting to $161,264. The total mine expenses amounted to $64,463, leaving a net profit of $61,982, after paying $34,882 to lessees. Within the same period $11,859 was paid for equipment and $4049 was expended on buildings. The ore came from eight different shafts; and 106 tons of the product, worth $6873, consisted of dump washings. The two principal shafts, Nos. 1 and 2, are 800 and 400 feet depth, respectively, and it is announced that each one will be sunk 200 feet deeper. From the shaft No. 1 three different veins are opened, from which shipments are made; there are also three veins being worked through shaft No. 2. A new hoisting engine, 20x48 inches, carries a double-decked cage and is capable of working to a depth of 2000 feet. At the ore house is a device for washing a portion of the dump, the talc and fine material adhering to the waste rock being washed off and settled, the sediment containing high values. The Vindicator Co. is a heavy stockholder in the Union Gold Extraction Co., whose reduction plant is almost ready for operating; when it starts up Vindicator ore will be taken to it.

Independence, Nov. 1,

(Special Correspondence).—The Vindicator's production for October ran about 3000 tons.

Chas. J. Moore has taken a lease on a block of ground adjoining the Cameron townsite, which belongs to the Pinnacle Co., and is to pay 25% royalty.

The Bull hill properties of the Victor Gold M. Co., which formerly were large producers, were sold by the County Sheriff on the 2nd inst. to satisfy a judgment in favor of D. H. Moffat, which amounted to $154,659, Mr. Moffat being the only bidder. The property is well equipped with machinery and was one of the first that was developed on Bull hill. During the year it has operated at a loss.

Victor, Nov. 3.

Shaft of Tenderfoot Hill Con. G. M. Co., Cripple Creek, is down 215 feet.

The Piggott & Conklin lease of the Big Mike, on Squaw mountain, Cripple Creek, is sold to Illigan Leasing Co., L. Johnson, manager, for $30,000.

Specimens of charcoal are being found in the Elsmere No. 1 shaft imbedded in the breccia at depth of 235 feet.

The Rittenhouse Co., Cripple Creek, has a new ore house on Gold Hill.

The White & Reynolds lease on Eclipse No. 1 of New Haven Co. is to be transferred to Chicago M. & L. Co. Development work will be carried out by means of funds derived from sale of treasury stock.

Work on the Nickel Plate No. 4 will resume. A 50-foot drift will be run on 350-foot level.

The Marie M. Co. will put in another compressor and will sink shaft to 845-foot level.

Sinking on the Nellie V., Cripple Creek, will be continued from 325-foot level.

The St. John Bostwick, on Raven hill, is sold to J. W. Proudfit & Co., of Colorado Springs, for $35,000. Development will be pushed.

Sinking on the Clyde is resumed.

The Atlantis Mines Corporation has resumed mining operations on the Santa Rita. During suspension a station was cut on the 550-foot level. The company has put in a telephone system throughout the workings.

Recent chemical experiments made in destroying gas from the Moose, Victor, have been partly successful; gas is believed to be of carbonic acid character, while ingredients used in destroying it are composed principally of bioxide of sodium. The chemical was ignited and lowered in bucket to sixth level, and in the course of few hours made the mine tenable. On following day it was lowered to 1000-foot level, to which point experimenters could almost approach in bucket. Further advances have been made, but, despite several efforts, success has not been attained to extent which will permit entrance into drifts.

The Golden Cycle Co., Cripple Creek, now has 110 miners at work. Work is resumed in all parts of the mine, and output is averaging 125 tons milling ore per day.

The new plant for the Granite, on Battle mountain, is on the ground and construction is under way. Chief operations in mine at present are on the 9th level, where drifting is being done on vein.

The trouble at the Independence caused by search method put into effect some time ago was settled on 31st ult. at a conference of management of the company and a committee of the Miners' Union. Work was resumed at 3 P. M. 1st inst.

The Denver Times says that the Portland mine at Cripple Creek has been sold to an English syndicate, including the Exploration Co., the Venture Co. and Werner, Belt & Co. The price is given as $15,000,000. A new company will be organized to take over the property and its stock will be floated in London.

The foundations at No. 2 shaft of the Portland, Victor, are ready for the new hoist. Hoisting is expected to begin by Dec. 15th.

Operations on the Elkton have been suspended, and men are at work tearing down the old shaft and engine houses, to make way for the new.

IDAHO.

BOISE COUNTY.

The Golconda, near Idaho City, is bonded to J. C. Stout of Minnesota, to be operated this winter.

CUSTER COUNTY.

The Clayton M. & Smelting Co., at Clayton, Mgr. L. Greene, will close down its furnace to-day, having on hand and in transit 1,700,000 pounds high-grade lead-silver bullion. The plant has a capacity of fifty tons ore per day.

J. McGregor, manager Salmon River M. Co., Bay Horse, will continue development during the winter.

LATAH COUNTY.

The Chickasaw M. & S. Co. of Princeton, capital $50,000, is incorporated; trustees, H. W. Greenburg and G. H. Wright of Spokane, Wash., and W. J. Springer, A. B. Harris and C. W. Levis of New Hampton, Iowa.

LEMHI COUNTY.

D. L. S. Barker, owner of the Silver Belt, at the head of Rock creek, has started a crosscut to tap the vein at a depth of 200 feet.

OWYHEE COUNTY.

A. Berg of Silver City has made a strike on Florida mountain.

Work on the Poorman & Pauper mines, near Silver City, is reported resumed after an idleness of nearly twenty years. Improved methods and general prosperity permit of resumption.

SHOSHONE COUNTY.

On the Blue Grouse group, Wallace, development is being pushed.

Near Pierce the Mascot 9-stamp mill is the only one running at present.

Near Wardner the spur is being built from the Sierra Nevada tunnel to connect with the O. R. & N. Railroad, 4½ miles long. Supt. Ennerson has 125 men at work; he pays $2.25 per day.

The Ruth M. Co., Wallace, will work four men during winter. They expect to run a tunnel.

MICHIGAN.

HOUGHTON COUNTY.

In Houghton it is expected that the Tamarack shaft No. 5, at a depth of 4300 feet, will tap the lode about Jan. 1st.

MONTANA.

CASCADE COUNTY.

"The longest electric railroad in the world" is proposed from Billings to Great Falls—200 miles—to be operated entirely by electric power, supplied from generating stations on the Missouri and Yellowstone rivers.

FLATHEAD COUNTY.

The mill of the American Kootenai M. & M. Co., Libby, is running. It is expected that work will be carried on all winter; general manager, W. Beager.

GRANITE COUNTY.

The Lehigh, Sunflower and Blue Bell, on Franklin hill, near Phillipsburg, have been bonded by Eastern men for $15,000, and work is in progress.

LEWIS AND CLARKE COUNTY.

The Montana M. Co., in the report of its revenue account, shows a net profit for the half year of £9816 19s 9d. The 60-stamp mill was in operation during the half year and reduced 25,100 tons of ore; the twenty stamps of the 50-stamp mill were in operation three months, reduced 1370 tons, making the total for the half year of 26,470 tons of ore, which sent to the mills yielded in bullion, bars and concentrates (on realized and estimated realizable values) $158,027.78, average $5.97 per ton. The expenditure on mining, milling and prospecting operations amounted to $164,359.07, equivalent to $6.21 per ton, resulting in a loss of $6331.29, or an average of $0.24 per ton. From the 5th of April to the 30th of June, 1900, 33,168 tons of tailings were brought under treatment and produced cyanide precipitates, realizing as per smelter's returns, $110,820.63, average $3.34 per ton; expenditure, embracing the treatment and transport of the tailings and redemption of cost of the tailings plant, amounted to $50,659.48, equivalent to $1.52 per ton, net profit $60,161.15, average of $1.82 per ton. Compared with the previous half year the average realized value of the product ($3.34) shows an increase of 63 cents per ton, and the net profit ($1.82) an increase of 60 cents per ton. In his report to the directors, General Manager Burrell says: "The development work has been a continual series of disappointments. At the end of last year we found a small ore body 50 feet below the 1000-foot level in the No. 3 shaft part of the mine. This discovery gave us encouragement to push on below, but the ore did not extend more than 25 feet up or down. We then sank the No. 1 winze to the 1100-foot level, and extended the south drift 115 feet, going beyond the ore found 50 feet above, but failed to find any pay ore on this level. Our object in drifting within short distances in this part of the mine was to enable us to open for immediate extraction any ore we might discover, so as to keep the mill in operation. When the 1200-foot level was reached in this part of the mine, at 17 feet from the winze, the south drift undercut ore at two different places for a distance of 20 feet each on the level. It is here that we are making the most active efforts. South of the last point above mentioned we encountered a fault, throwing the vein 70 feet toward the hanging wall. Following the faulting plane to the east we re-encountered the vein, and while it is 65 feet wide between the walls, and not barren, no pay ore was found in this work. Owing to our want of success here and at other points in the mine, the 60-stamp mill was shut down on July 15th until such time as our development work shall discover sufficient pay ore to enable us to again resume milling operations."

At the head of Big Blackfoot river there are bodies of gold-copper ore. J. K. Waite, Sec'y Montana Copper M. Co., which owns the Marlinspike, W. J. Bryan, Copper World and other claims, says: "Although at present remote from the railroad, the veins of that district can be worked out at 30% of the cost involved in Butte. They can all be developed to great depth by tunnels; the country is heavily timbered, being within 3 miles of the Lewis & Clarke forest reserve, and there is abundant water power in the streams to operate. The principal leads are in Mineral mountain; the summit, 9000 feet above sea level, is granite. Under this is a belt 2000 feet deep, of copper-bearing rock, porphyry and gneiss, subdivided by strata of slate. Lund Bros., Dickson & Nelson have driven a tunnel 300 feet on the hanging wall and crosscut 120 feet to the foot wall. The mines are reached from Drummond by a wagon road to Kleinschmidt flat, on Cooper lake, to the Marlinspike."

Output from Elkhorn Queen, near

Helena, for last four months has averaged 1000 tons per month. Upon completion of additions to works at East Helena, force at this mine will be increased. Sinking is in progress. A shipment of fifteen tons of ore from the Howard, Helena, netted $1600.

MADISON COUNTY.

Men are at work in the Keystone and Strawberry mines near Pony. The raise between the lower and upper levels of the Strawberry has been completed and stoping is in progress. The mill has resumed.

The new 50-ton concentrator of the Red Chief M. Co., operating the Waterlode and Red Cliff mines, Red Bluff, is completed.

NEVADA.

WHITE PINE COUNTY.

(Special Correspondence).—The Jupiter group, heretofore belonging to L. S. Scott and W. J. Peters of White Pine, has been sold to a company, prominent in which are Byron E. Shear and E. P. Giroux of Denver, Colo., J. A. Snedaker of Denver having made the examinations for the purchasers. The property is said to embrace two ledges of ore carrying principal values in copper and accompanied by considerable gold. Active development is now in progress.

White Pine, Oct. 30.

The new mill at the Robust, near Ely, with crushing capacity of 120 tons crude ore daily, will run, it is said, by Dec. 15th.

HUMBOLDT COUNTY.

The Ogden Copper Co. of Ogden, Utah, capital $375,000, is incorporated to work the South Star, Capital, North Star No. 1 and other properties.

STOREY COUNTY.

Crosscut No. 2 on the 900-foot level at the Caledonia, Virginia, is in over 35 feet. Ore from the 900-foot level in the Overman runs $17.46 per ton, $8.27 being gold.

NEW MEXICO.

BERNALILLO COUNTY.

Work on the new mill of the Cochiti Reduction & Improvement Co. at Woodbury is being pushed.

DON ANA COUNTY.

At the Torpedo, Organ, work of pumping out south shaft is in progress. The new pump is satisfactory, it is said, having pumped out 14 feet of water in twenty minutes.

GRANT COUNTY.

The Summit group of lead mines, Cook mining district, has been sold to Fuller Bros. of Chicago for $75,000. The ore is a sand carbonate, with galena. The deepest shaft is 140 feet. F. A. Fuller will supervise the work of putting in machinery and beginning operations. Electric drills and machinery will be put in. A tunnel which will strike the ore body several hundred feet lower than present workings will be run.

The El Paso Co., operating the Othello and Desdemona properties, has thirty men at work.

The Deming M. & M. Co. has bought forty acres near Deming for a mill site. It is expected mill will be ready in January.

The Stenson mines, in the Florida mountains, are shipping ore to the Silver City smelter.

SOCORRO COUNTY.

Ore now being taken from the 9th level of the W. H. Martin Co. mine is yielding $500 to the ton, it is said.

In the Cochiti district work on Algodones smelter will commence soon. It is expected that within a month 300 men will be working.

STOREY COUNTY.

On the Utah, Virginia, surface tunnel No. 2 has been extended a total of 731 feet.

WHITE PINE COUNTY.

Final transfer of the Chainman mine at Ely to Eastern men is effected: selling price, $150,000—$50,000 cash, balance in two deferred installments. The new company is the Chainman M. & E. Co.; L. F. Shepherd, Supt.; F. D. Smith, mill Supt. It is estimated that the ore can be mined and delivered to the mill at $1 per ton. The cost of treating the ore by the plate amalgamation process and of cyaniding the tailings has been estimated by F. D. Smith to be $1.25 per ton. The company will have the present milling capacity increased to 125 tons per day and erect a 100-ton cyanide plant.

OREGON.

BAKER COUNTY.

Additional men have been put on at the Gold Ridge, White Swan camp, near Baker City.

The Little Giant, Sumpter, has resumed. The crosscut tunnel, now in 900 feet, will be extended to main ledge. Machinery for 20-stamp mill is on the ground, but same will not be put up until results of development are known.

It is expected to have a stamp mill on the Tammany by May 1, 1901.

GRANT COUNTY.

A hoist is being put in on the Red Boy, Granite, and sinking will be continued to 2000-foot level.

The Cougar, J. W. Larkin manager, has a number of men at work. The cyanide plant has capacity of 200 tons.

Men will be put on at the Little Giant and work pushed.

The Concord group, J. H. Robbins owner, is being developed.

A. J. Trimble of Sumpter has taken a bond on the Grizzly group and is working same.

GRANITE COUNTY.

J. G. McGuigan will resume work on the Alamo, near Grant.

J. T. Grayson will run a 3000-foot tunnel to tap the Gold Bug and other properties.

The Monumental (silver) may soon resume.

The shaft house on the Portland is completed; sinking is progressing.

JACKSON COUNTY.

The Roberts & Jillson, Henley, has produced $300,000 in last two and a half years. In past four months it has produced $200,000; fifty men employed. The La Flesh & Miner has struck rich pay shoot.

The Gold Hill Quartz M. Co. has resumed. At the Kublia lead has been struck running $100 to ton.

SOUTH DAKOTA.

CUSTER COUNTY.

(Special Correspondence).—David Jones recently shipped a car of ore from the Globe mine to Denver, Colo., as a test to aid in determining whether it were better to sell the product of the mine direct or ship to the smelters and pay smelting charges. The ore ranges in value from $15 to $20 per ton.

Custer, Nov. 3.

LAWRENCE COUNTY.

Colorado men have closed deal for the Dakota Maid, Deadwood, J. King owner; they will put in a cyanide plant. The British-American M. Co. of Detroit, Mich., will put in cyanide plant on the Bronson. The Elizabeth M. Co., now experimenting with cyanide process on ores from the Bismarck, may put in cyanide plant and a stamp mill.

PENNINGTON COUNTY.

The Keystone belt of ore begins 4 miles northwest of Keystone and extends southeast 20 miles, disappearing under the limestone near French creek. The principal mining companies at work in the Keystone district are the Holy Terror, Bismarck, Golden Return and Lucky Boy, east of the Holy Terror mine.

UTAH.

BEAVER COUNTY.

Ore on property of the Ben Harrison Copper M. Co., near Beaver, Beaver Lake district, assays 25% copper and $8.20 in gold to the ton.

JUAB COUNTY.

(Special Correspondence).—W. H. Brevoort of Cólorado has sold his interest in the Carissa mine, near Mammoth, to Eben Smith of Denver and H. E. Cary of Salt Lake City, who control the property.

Mammoth, Nov. 2.

The final payment of $18,000 on the purchase price of the Illinois group at Eureka by the Illinois M. Co. is made.

The Ridge & Valley and Gemini mining companies, owners of adjoining properties at Tintic, have arrived at a satisfactory agreement. At a recent meeting the Gemini Co. consented to the drawing of a deadline between the two, and to further payment of $7500 for ores extracted from the latter's ground.

Hannafin Bros. are pushing work on the Mountain View, near Eureka.

At a depth of 973 feet in the Swansea at Silver City 5 feet of carbonates are exposed. The rule has been that they have yielded $3000 per carload in silver and lead.

PIUTE COUNTY.

The Sevier Con. G. M. & Prosp. Co. of Ogden, capital stock $50,000, is incorporated to work the Pointer, Sevier Extension, Erie and the Erie Extension, in Gold Mountain district, near Kimberly.

Richfield and Kimberly are to be connected by telephone.

SALT LAKE COUNTY.

The Ben Butler, Supt. McQueen, is taking out ore from a 12-inch streak.

Supt. Nutting of Bingham C. & G. Co.'s smelter, Bingham, reports all materials for the new plant are on the ground ready for construction.

The Dewey mill, Bingham, is running on ores from the Nast and other properties near there.

Bullion output for October at the Highland Boy smelter is reported at nearly 600,000 pounds.

At the Aurora, Marysville, ore has been struck running $10.80 gold, with a small amount of silver, to the ton.

SUMMIT COUNTY.

Sinking on Ontario shaft No. 3 will be continued to the 200-foot level.

J. Boyle of Park City will put in a 50-ton matting plant for the Valeo, near there.

TOOELE CO.

Material for the new roasting plant at the Sacramento, Mercur, is on the ground. Manager McConaughty will push construction to have the furnaces lighted up within the next sixty days.

On the 400-foot level of the Showers Con., Diamond, Tintic district, high-grade copper ore has been opened up. The new air compressor and drills will be started up and sinking resumed.

It is stated that the old Copper Plant, J. P. Channing manager, will resume.

The new ore bins at the Star Con., Tintic, are completed and extraction of ore will be resumed.

During October the Con. Mercur, Mercur, produced 30,699 tons ore—an average of nearly 1000 tons per day.

WASHINGTON.

FERRY COUNTY.

The Mountain Lion, Republic, has suspended operations.

Development is progressing at the Quilp.

At Republic the shaft at the Alpine, now down 50 feet, will be continued to the 300-foot level.

Supt. Nickerson of the Butte & Boston, Republic, has struck 2½ feet of good quartz in a 30-foot drive in the hanging wall.

By the partial closing down of the Mountain Lion, Republic, fifty men are out of employment. Twenty-five men are at work drifting on east ledge.

The shaft of the Tom Thumb is to be sunk to depth of 450 feet.

OKANOGAN COUNTY.

The American Flag G. M. Co. will put in a stamp mill on Goat creek, near Winthrop, by next spring. The size of the mill has not been given, but it is said that it will be either a 20 or 40-stamp mill.

It is stated that the War Eagle, Loomis, will be worked through Palmer mountain tunnel. This will tap War Eagle vein at 800 feet depth, and will save expense of hoisting and a 2-mile wagon haul to mill.

SNOHOMISH COUNTY.

Development work will be started on the Mountain King group, near Index, by Tacoma men who recently took it under bond for $15,000.

In the face of the 4½-foot tunnel at the Kittanning, Index, 30 inches of high-grade chalcopyrite have been opened up.

WHATCOM COUNTY.

Mr. Slanislawski, owner of the Post–Lambert properties on Lone Jack mountain, Mount Baker district, is making improvements and expects to continue during the winter.

FOREIGN.

AUSTRALIA.

At the Gold Fields of Victoria, Bendigo, in crosscutting on the 1030-foot level, several spurs were opened up, average width 7 feet, running 8 dwts. to the ton.

BRITISH COLUMBIA.

The tunnel on the Review, near Bolster, in 650 feet, is expected to strike the vein within 50 feet. If the vein shows well, a mill may be put in.

Work on the Buckhorn will continue during the winter. Two shifts are driving the 400-foot crosscut tunnel.

The Phœnix, near Canterbury, will run a 200-foot crosscut.

Sixteen men are working on the Paradise, on Spring creek.

Thirty-eight tons of ore from the Rambler–Cariboo, Slocan, recently returned $14,568.20 to the ton, or 54.9 ounces gold and 63.3% lead per ton. The main drift, to be completed by next May, will be 2000 feet long. It is said that a concentrator will be put in.

There are two grades of free-milling ore found near Ymir. The first, from the Ymir, carries considerable galena with quartz and is about 75% free milling. By a combined amalgamating and concentrating plant, however, only 2% or 3% is lost. The Porto Rico ore is free milling in about the same proportion, but galena is absent, being replaced by iron sulphides.

The main shaft on the Greyhound, near Greenwood, is down 135 feet, and will be continued to the 200-foot level. The tunnel on the Great Hopes is in 345 feet. On the No. 2 and the No. 3 veins on the Morrison, drifting is in progress.

Operations at the Le Roi, Rossland, are to be pushed by Manager B. Macdonald. A new five-compartment shaft will soon be completed to the 900-foot level and a plant put in; cost about $250,000.

The King Solomon Co., on Woodberry creek, Slocan, has twenty-five men working. It is expected that the Ivanhoe mill will soon start up. Power hoists will be put in on the Iron Mask and the Lucky Strike, Kamloops, and monthly shipments made. Operations on the Empire group have stopped for the season; 210 feet of crosscutting and 40 feet of drifting along second lead had been done up to the time of stoppage. It is reported that a 6-foot ledge of solid galena has been struck in the Aurora, across the lake from Moyie, East Kootenay.

The St. Eugene Con. 400-ton concentrator, Whitewater, is running to its full capacity and turning out 100 tons of concentrates every twenty-four hours. It has recently received further order for 2500 tons of concentrates from Guggenheim Bros., Antofogasto, Chile.

There are 350 men employed in Trail smelter and payroll runs $27,000 per month. When capacity of smelter is doubled, the plant for which is now being put in, the payroll will be increased.

It is reported that tin has been found on the Dayton group, 5 miles from Kaslo.

At the Ymir, near Ymir, eighty stamps are dropping, crushing 200 tons ore per day, netting $5.50 per ton; capacity may be increased to 160 stamps.

The Granby smelter, Phœnix, Supt. Hodges, recently treated 616 tons ore from the Knob Hill and Old Ironsides in one day, being 116 tons over normal capacity. Ores from these mines are self-fluxing, which accounts for big run.

J. B. Charleson, Supt. of construction Quesnel–Dawson telegraph line, reports line complete and in working order to a point 570 miles north of Quesnel.

The Leo Gold Mines Co., Ltd., J. Moran Pres., have resumed operations near Hall.

The new compressor at the Nickel Plate, Rossland, will be running in the near future. Building is well under way.

Work on the new smelter of the British Columbia C. Co., Greenwood, P. Johnson Supt., is progressing; it will be completed next month.

Operations on the Empire group, Lardeau, have ceased for the season.

R. Dore is working his nickel claim on Wild Horse, East Kootenay.

The Society Girl will ship during the winter.

The Paradise group, Windermere district, Manager Bruce, will continue operations during the winter.

Coryell Bros. of Grand Forks have been given contract to furnish 80,000 bricks for Mother Lode smelter at Greenwood.

The B. C. is shipping 1000 tons of ore per week.

A small pumping plant will be put on the Carmi, near Greenwood, and work will be pushed during the winter.

Drifting on the 300-foot level of the Brandon and Golden Crown is progressing; G. H. Collins, managing director.

After a two years' shut-down, the Salmo Con. G. M. & D. Co., 10 miles from Salmo siding, in Nelson mining division, will resume.

A strike has been made on the Snow King group, on La France creek, 8 miles south of Pilot bay. Ore carries gray copper and ruby silver; T. Wall, owner.

An electric light plant will be put in at the Sullivan, East Kootenay.

The Yankee Boy and Yankee Girl group on Hardy mountain, near Grand Forks, are shipping ore to the smelter at that point.

J. Hamilton has resumed development work on the Betts & Hesperus group. Ledge is 20 feet wide and has been opened up by cuts and 30-foot shaft.

The Snowshoe, in Wellington camp, will soon begin shipping ore to the Granby smelter.

Lower tunnel at the Douglas–Hunter, Rossland, is in 540 feet.

Shipments of ore from the Brandon and Golden Crown, Greenwood, G. H. Collins managing director, will be suspended until completion of British Columbia Copper Co.'s smelter and of the Standard Pyritic smelter, near there. Development is progressing on the 300-foot level.

BRITISH GUIANA.

For mining purposes British Guiana is divided into five districts. The local mining laws provide that no placer claim shall exceed 1500 feet in length or 500 feet in width, and that no person shall hold more than five placer claims in one district. The Government royalty is 90 cents on each ounce of gold and 4 cents on each ounce of silver.

LOWER CALIFORNIA.

At San Diego C. Benton says he has

bought from J. Brophy and associates the San Fernando group of copper mines, 70 miles south of San Quintin, for P. Burns of Canada, W. R. Ramsdell of Helena, Mont., and others.

MEXICO.

(Special Correspondence). — The Paso City Copper Co. of El Paso, Texas, has been incorporated under the laws of Arizona to develop the General Guerrero and other properties in the State of Chihuahua and elsewhere. Capital stock, $100,000; A. Emig, president; H. E. Runkle, secretary.

El Paso, Texas, Nov. 3

The New Mexican Rosario M. Co. of Nieves, Zacatecas, will put in new hoisting pump on its property near there.

The Las Guijas (silver), owned by M. Villegas, is sold to Los Angeles men, who will erect plant on property.

Torrington, Conn., men have secured bond for six months upon the Nieves Con., and are pushing development work.

The mines at San Miguel de Mezquital, 45 miles from Nieves, have been closed down since September, 1898, when they were washed out by inrush of water at the rate of 1000 gallons per minute.

The Angelica (copper and silver), 15 miles from San Gabriel, State of Durango, has been bought by a Carnegie, Pa., company, which lately bought the Voluntad de Dois (gold) in that vicinity. A. C. McCaughan is Supt. both properties.

The Chihuahua Enterprise asserts that the Rosario mine, at Guadalupe y Calvo is sold to W. A. Clark for $50,000.

SOUTH AFRICA.

The delay of Roberts in closing up the Boer war has been so prolonged that April 1st or July 1st is the best now looked for. Gen. Roberts allowed twenty men to enter Johannesburg for the purpose of looking after the mines. Pumping had been commenced at some of the mines, but according to the latest advices this had been stopped owing to the difficulty of obtaining supplies from the coast. The fact is that Roberts' forces require all the facilities the railroads can furnish, and the mines must wait until the armies have returned to the coast.

A Chicago firm which has had on its hands mining machinery for the Transvaal, ordered before the war began, has instructions to start it, and $2,000,000 in South African gold is reported on its way to this country to pay for more machinery for the Rand.

THE KLONDIKE.

As a result of the first auction of Crown claims in the Klondike, out of 300 claims offered for sale, 200 were sold at prices ranging from $1 to $1350, the latter price being paid for a claim on Gay gulch. The sale realized $19,500. The balance of 5000 claims will be offered for sale this month, and, if not sold, opened for relocation. Dawson welcomes the order of the Government abolishing Crown claims. In the future claims abandoned by their owners will be subject to relocation and will not revert to the Crown.

Catalogues Received.

D. Hug, manufacturer of the Hug water wheel, Denver, Colo., has issued a new catalogue, describing this wheel and its work and giving data of interest to those utilizing water power.

"Giant Air Compressors and Giant Rock Drills" is the subject of the latest catalogue issued by the Compressed Air Machinery Co., 11–13 First St., San Francisco, profusely illustrated and descriptive of the different sizes and styles of their manufacture, with double cylinder, single and double drum hoists, pneumatic tools and other specialties made and furnished by the company.

Westhinghouse railway motors are finely illustrated and described in the latest brochure issued by the Westinghouse Electric & Manufacturing Co. of Pittsburg, Pa., the types treated having been given the test of working operation. The concluding part of the handsome treatise depicts typical railway power-house installations supplied with both direct current and polyphase systems. Copies of the pamphlet will be mailed to officers of electric railways, consulting and contracting engineers, and others interested, upon application.

Books Received.

"A Handbook of Rocks, for Use Without the Microscope," is the title of an octavo of 185 pages by James Furman Kemp. The book is worthy of the author, and should be of value to beginners. All its contents, except the glossary, have been published before, and here appear in convenient form. Published by D. Van Nostrand & Co., New York City; price, $1.50.

Personal.

HORACE F. BROWN is at Lillooet, B. C.

G. CROSS of Salt Lake, Utah, has gone to Mexico.

G. B. NORMAN of Salt Lake, Utah, has gone to Arizona.

W. C. WYNKOOP of Bland, N. M., has gone to Chicago.

F. RICHMOND of Salt Lake City, Utah, has gone to Denver, Colo.

R. MILLET of Salt Lake, Utah, goes to Australia and New Zealand.

T. THORNTON of Chloride, Ariz., has gone to Cripple Creek, Colo.

W. H. BRAVIN is manager Tulloch-Magruder mine, Angels, Cal.

J. SHERLOK, Bland, N. M., has returned there from California.

LUDWIG MOND is examining mining property at Sudbury, Ontario.

J. J. CRAWFORD has returned to San Francisco from Placerville, Cal.

D. C. JACKLING has returned to Republic, Wash., from Spokane, Wash.

JNO. TREWEEK, former Supt. Mercur, Utah, mine, has gone to South Africa.

W. WOLF of the Ruby, Nevada City, Cal., has returned from San Francisco.

J. S. HANNA of the Sacramento M. Co., Eureka, Cal., has gone to Bloomington, Ill.

ELISHA HAMPTON succeeds F. M. Manson as Supt. Banner mine, Nevada county, Cal.

H. P. GORDON has returned from Nome. He says "California is good enough for me."

C. S. WHITWER, vice-president Spencer Con. M. Co., Seattle, Wash., has gone East.

RICHARD A. PARKER of Boston is examining mining property at Bingham, Utah.

C. J. DEVEREAUX of Boston, Mass., of the old Mercur Co., is in Salt Lake City, Utah.

J. H. PIERCE, formerly of the Alaska, Tintic, Utah, has returned there from Nome.

SUPT. PORTER, Mutual mines, Sutter Creek, Cal., has returned there from Oregon.

C. R. CLAPP, Treas. and Wm. Jenks, Supt., Jura-Trias Cop. Co., Toledo, Ohio, are in Utah.

G. E. TOMLINSON is now chemist and assayer Copper Queen Con. Copper Co., Bisbee, Ariz.

E. A. DAVIS, Supt. Ribbon Rock, Placerville, Cal., has returned there from Redding, Cal.

L. D. CLOUD of the La Democrata mine, Mexico, has returned there from Nogales, Ariz.

RICH. STANFORD is examining some Tuolumne county, Cal., mines for a New York company.

J. W. NEILL, Manager Taylor-Brunton Sampling Works, Salt Lake City, Utah, is in California.

R. O. JENNINGS, manager Mount Sicker M. Co., Kimberley, British Columbia, has resigned.

C. W. RAYMOND has charge of operations of the Crystal Lake G. M. Co., Meadow Lake, Cal.

SUPT. J. A. KIRBY of the Daly–West, Park City, Utah, has returned there from Salt Lake City, Utah.

E. W. HEYL of Heyl & Patterson, Pittsburg, Pa., has returned from an extended European tour.

GENERAL MANAGER L. R. POUNDSTONE of the Densmore, near Jamestown, Cal., is in San Francisco.

F. H. HARVEY has returned to Galt, Cal., from an examination of the Banner mine, Nevada county, Cal.

CHAS. STEBBINS, a Cripple Creek mine operator, is in San Francisco to bond some California mining property.

E. T. WASHBURN, Supt. Lone Star mine, Bland, New Mexico, has resigned and has gone to Grass Valley, Cal.

J. A. RICE succeeds E. T. Washburn in the superintendency of the Navaho G. M. Co.'s Lone Star mine, Bland, N. M.

J. H. HENLEY, Supt. Ibex mine, Leadville, Colo., has gone to Chihuahua and Sonora, Mexico, on mining business.

B. MACDONALD, manager British American Corporation, Rossland, B. C., has returned there from London, England.

D. MCVICHIE, general manager Cochiti and Navaho mines, Bland, N. M., has returned there from Salt Lake City, Utah.

F. L. BARTLETT, general manager American Zinc–Lead S. Co., Canyon City, Colo., is convalescent after a serious illness.

A. SHARP of Rossland, B. C., has been appointed Supt. First Thought mine, Pierre Lake district, Washington, vice W. H. Manning.

WM. YOLEN WILLIAMS, manager of the Miners & Graves Syndicate of Rossland, B. C., recently made a tour of the mines of Colorado.

T. A. RICKARD AND J. H. HAMMOND were examining mines at Mercur, Utah, last week, the former going to New York City, the latter returning to California.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR WEEK ENDING OCTOBER 30, 1900.

660,807.—GATE — H. Alten, Sebastopol, Cal.
660,612.—WEED DESTOYER—M. J. Anderson, Defur, Or.
660,715.—BREASTWORK—R. S. Anderson, Tacoma, Wash.
660,839.—WEATHER STRIP—J. E. Bundy, S. F.
660,947.—BURIAL APPARATUS—J. Carhart, Campbell, Cal.
660,890.—PLANTER—J. C. Colby, Visalia, Cal.
660,844.—GOLD SAVING APPARATUS—W. E. Darrow, Sonora, Cal.
660,789.—HYDRAULIC NOZZLE—W. A. Doble, S. F.
660,632.—BAND CUTTER—T. Elliott, Dallas, Or.
660,895.—TRUSS — J. Fandrey, Los Angeles, Cal.
660,794.—WEIGHING SCALE — Hanek & Hoepner, S. F.
660,957.—FOOT WARMER — Helena Hermans, Tacoma, Wash.
660,645.—TRACK BRAKE—Lowe & Meighan, S. F.
660,967.—NAIL—J. G. McGaughey, Spokane, Wash.
660,709.—FRUIT CLIPPER—N. B. McGhee, Orange, Cal.
660,734.—PIPE WRENCH — Nordham & Bramlette, Downey, Cal.
660,922.—DRAG SAW—J. H. Perkins, Seattle, Wash.
660,736.—LOCK — B. Phelps, Seattle, Wash.
661,022.—BICYCLE BRAKE—H. E. Pringle, Redlands, Cal.
33,475.—DESIGN—G. T. Willis, Fresno, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ORE SEPARATOR.—No. 660,342. Oct. 23, 1900. J. P. Smith, Denver, Colo., assignor of one-half to A. H. B. Harenc and J. A. Lehrritter, of Salida, Colo. This invention is designed to separate heavy valuable portions of ore from their gangue and from other associated material as well as from each other. It consists essentially of transversely inclined shaking tables having longitudinally disposed guides, the ends of which lie in diagonal lines from one side to the other of the table; slime conveyors and movable hinged fingers at the end of the table opposite the receiving point; intermediate between the tables is a return conveyor which receives the pulp from the first table and has a movement independent of that of the tables. In conjunction with these tables is a mechanism for producing a shaking movement.

REMOVABLE VENTILATING PITCHER COVER.—No. 660,370. Oct. 23, 1900. A. Drennan, A. Smith and A. Graham, of Bodie, Cal. This invention relates to a device for preventing the access of flies and insects to pitchers and like containing articles, and a means for providing ventilation for the contents and removably attaching the device to the pitcher, so that they can be separated and perfectly cleaned. The device consists of a wire ring surrounding the pitcher between the swell of the body and outer curve of the top, this wire having angular bends at the rear, and it is thence carried up over the rear of the cover, the latter fitting the top of the pitcher. The bends are separated from each other to allow then to expand when the rim is to be removed, and coiled springs encircle that portion of the wire which extends horizontally over the rear of the cover adjacent to the handle. Each of these springs has one member attached to the cover and another member secured to the ring at a point between the rear portion and the angular bends so as to normally close the cover. An upwardly projecting loop serves as a thumb piece so that by pressure upon this the cover can be lifted to pour out its contents, the coiled spring yielding for that purpose and acting to again close the cover as soon as the thumb piece is released.

ALMOND HULLER AND SEPARATOR.—No. 659,801. Oct. 16, 1900. Walter G. Read, Colusa, Cal. This invention relates to an apparatus for removing the hulls from almonds and separating the hulled nuts from the unhulled nuts, hulls, leaves, sticks, etc., delivering the cleaned hulled nuts into a receptacle, the unhulled nuts into another receptacle, and the separated hulls, leaves, sticks etc., into still another receptacle. It consists of a cylinder or drum, a longitudinally journaled rotary shaft extending therethrough, means for delivering the unhulled almonds into the drum, beater arms fixed upon the shaft within the drum, with radial braces or arms in the receiving ends of the drum having their outer ends twisted or turned to present their edges towards the nuts so that the latter will pass readily through the drum. From this drum they are delivered upon a suspended shoe which has means for oscillating it, and a peculiarly constructed wire screen surface which allows the hulls to pass through while retaining the almonds thereon. Other screens and chutes are employed upon which the separated materials are received, and means for delivering them to their proper receptacles.

FRUIT PACKING FORM.—No. 660,362. Oct. 23, 1900. S. L. Casella, Alma, Cal. This invention is designed to provide an apparatus for rapidly filling baskets or packages with fruit, such as grapes, berries, etc., which are ordinarily packed into small veneer baskets. The apparatus consists of a rectangular frame having elastic metallic plates fixed and projecting outwardly in one direction, and these frames are approximately the shape of a basket which is to be filled. Between the plates is fitted a slidable block which may be moved to the top or bottom, with means for holding it in position. The frame is fulcrumed in a yoke, which yoke is fixed to the table or bench where the work is to be done, and the frame is turnable to reverse it, with suitable locking devices for either position. The frame being turned so that the plates project upwardly, the block or plate within the space enclosed by the plates drops to the lower side, and is there supported while the space between the plates is filled with the fruit. The basket is then inverted over these plates, and the device being reversed the basket is withdrawn and the movable plate acts as a follower to press the fruit into the basket as it is removed.

PIPE RIVETING MACHINE.—No. 660,542. Oct. 23, 1900. S. Foreman, Sacramento, Cal., assignor to Schaw, Ingram, Batcher & Co. of same place. This invention is designed for riveting large gas, water and other pipes which are laid in trenches, or other permanent resting places, and joined together to form a continuous pipe after the sections which are usually made in the shop are brought to the place where they are to be finally laid. The ends of the meeting sections are slipped one into the other, and holes being made through them, they are riveted by the use of a pneumatic tool, preferably operating upon the point of the rivet inside of the pipe. On the outside is a holder-on or anvil which presses against the heads of the rivets, while the inner end is being upset by the tool. In this invention a band surrounds the pipe extending on one side sufficiently to form a yoke to receive the holder-on and anvil, and these are secured to these projecting ends of the yoke so as to stand in line with the rivet while the latter is being headed. The device is easily turnable so as to advance the anvil to the next rivet and so on successively until all are riveted and the joint completed. The pipe thus serves to support the resisting anvil without any exterior support. The anvil itself is peculiarly made to extend out flush with the edge of the outer section of pipe and serves to close the two pipe sections together and make a tight joint without subsequent calking.

APPARATUS FOR MAKING SEAMLESS TOOTH CROWNS.—No. 660,319. Oct. 23, 1900. J. F. Twist, San Francisco, Cal. This invention is designed to form tooth crowns and to fit and adapt them to the position in which they are to be used. It consists of an apparatus for primarily shaping the crowns consisting of a series of dies, a supporting stand, a guide fitting the stand concentrically with the dies and punches by which the part to be shaped is passed through the successive dies until the desired form and size has been produced. The punches are guided by radially moving wings slidable in a casing and acted upon by springs so that they will fit any size of punch.

GATE.—No. 660,807. Oct. 30, 1900. Henry Alten, Sebastopol, Cal. This invention relates to improvements in gates such as are used upon farms. It consists of a hinged gate adapted to swing so as to stand transversely across the road which is to be closed, or by swinging to one side to stand parallel with the roadway and leave a free passage, and in combination with such gate, a mechanism by which the gate may be unlatched by a person approaching from either side, and mechanism by which the gate is caused to swing to either open or close. In conjunction with this is a latching device by which the gate is retained in either its open or closed position. These movements are all produced by a vertically disposed fulcrumed lever which acts to raise the latch, tilt the gate and cause it to swing. Connections are made between this lever and other levers located at the side of the road, and at a sufficient distance from the gate so that the approaching passenger can operate the levers and open it.

Commercial Paragraphs.

THE E. P. Allis Co. is supplying a 1200 H. P. Corliss engine for the plant of the Colorado Fuel & Iron Co., at Pueblo, Colo.

THE Frantz & McRay Co. are fitting up a new machine shop on Delgany St., Denver, Colo. All work will be done with electric power.

AN 18-drill air compressor of the Rand make has been shipped to Creede, Colo., for the Commodore mine. It is a cross-compound, with steam and air cylinders 24x14 inches each.

THE Colorado Iron Works have made a shipment of such machinery as will be necessary to rebuild the plant of the Cochiti Reduction & Improvement Co. at Woodbury, N. M.

J. GEO. LEYNER of Denver, Colo., is building a 16-drill, compound compressor for the Amador Copper & Gold M. Co. of Wallace, Idaho, whose mines are at Iron Mountain. This compressor will be belt-driven by a water wheel. Mr. Leyner also reports the sale of a 16-drill compressor and additional Leyner drills to the King of Arizona mine, at Mohawk, Ariz.

THE diamond drills of the M. C. Bullock Mfg. Co. of Chicago, Ill., have been awarded a gold medal at the Paris Exposition, the only diamond drill that received such award at that exposition. The company would be pleased to send any prospector or miner their complete diamond drill catalogue No. 33, upon application to their office, 1170–1172 W. Lake St., Chicago.

Latest Market Reports.

SAN FRANCISCO, Nov. 8, 1900.

SILVER—Per oz., Troy: London, 29¾d (standard ounce, 925 fine); New York, bar silver, 63⅝c (1000 fine); San Francisco, 63⅝c; Mexican dollars, 50½c.

The London Statist says: "As the silver in the reserve is now at an irreducible minimum, the whole of the further demand for rupees will have to be met by purchases of new silver. If India absorbed 60,000,000 ounces of silver in the past year of famine, what will it require in a year of prosperity? The world's production of silver is not much over 160,000,000 ounces, and India's requirements in the past year have been equal to nearly 40% of the total output. From the closing of the Indian mints until the current year India's purchases of silver were not more than about 15,000,000 ounces per annum. Now we have the prospect that the demand may be 60,000,000 ounces a year. It will be evident, therefore, that the Indian Government will be a constant and large buyer of the silver and that the price in the future will probably rule at a much higher level than it has done since the closing of the Indian mint."

COPPER.—New York: Lake, 1 to 3 casks, $17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.50; Casting, 1 to 3 casks, 16.75; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.37½; Salt Lake City, $4.00; St. Louis, $4.27½; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £17 11s 3d=3.76c per ℔.

SPELTER. — New York, $4.20; St. Louis, $4.05; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $14.00; gray forge, $13.50; San Francisco, bar, per lb., 2½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $20.00; open hearth billets, $23; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $27.50; San Francisco, ton lots, 30c; 1000 ℔s., 30½c; 500 ℔s., 30c; less, 31c; bar tin, ꝑ ℔, 35c.

QUICKSILVER. — New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.00 ꝑ flask of 76½ ℔s.; Export, $45.

NICKEL.—New York, 50@60c ꝑ ℔.

MAGNESIUM.—New York, $3.00 ꝑ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¼c; slab, 5¾c; bar, 7c.

BABBITT METAL.— San Francisco, No. 1, 10c.

SOLDER. — Half-and-half, 100-℔. lots, 18.70c; San Francisco, Plumbers', 100-℔. lots, 15.85c.

ASSAY LITHARGE.—San Francisco, 10c ꝑ ℔, small lots.

BISMUTH.—New York, ꝑ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PHOSPHORUS. — F. o. b. New York 50@60c ꝑ ℔.

TUNGSTEN.—New York, ꝑ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.—San Francisco, crude, $17 ꝑ oz.; New York, $18.20 per Troy oz

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ꝑ set; 14 oz., 40s., 10½c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32½@33½c ꝑ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ꝑ ℔.; soda ash, $1.60 ꝑ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ꝑ ℔.; blue vitriol, 5½@6c ꝑ ℔.; borax, concentrated, 7@8c ꝑ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾ @ 2c; nitric acid, in carboys, 8c ꝑ ℔.; caustic soda, in drums, 3@4c ꝑ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ꝑ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

OILS.—Linseed, pure, boiled, bbl., 86c; cs., 91c; raw, bbl., 84c; cs., 89c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 70c; cs., 75c; No. 1 bbl., 50c; cs., 55c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 65c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

San Francisco Stock Board Sales.

SITUATIONS WANTED.

ELECTRICIAN AND MACHINIST would like to get a place in the country or city or in mine; has the best of letters. Box 56. this office.

MINING ENGINEER (technical training), twenty years' experience as surveyor, assayer, superintendent and manager of mines and mills; business qualifications; linguist; at present general manager mining and milling proposition in Mexico; desires to make a change on account of health; best references. Address S. O., Mining and Scientific Press.

Mining engineer with ten years' experience in copper and lead mining, milling and smelting, desires to secure position as superintendent or manager of developing or producing property in this country or abroad. Good assayer, surveyor and bookkeeper. Address "Montana," care of Mining and Scientific Press.

Copper Blast Furnace Foreman. Experienced man wants position. A1 references Address "Copper," care of Mining and Scientific Press.

WANTED.

A Second-Hand Diamond Drill. Must be in first-class condition and complete in all respects. Address H. R., Mining and Scientific Press.

Superintendent of drift mine desires responsible party to join him in purchase of same. Complete outfit, water power, and on paying basis. $15.000 on easy terms. Patented. Principals only. Address "Superintendent," Box 46, this office.

WANTED—The address of Thomas Watts. bricklayer and miner, formerly of Butte, Montana, and Denver, Colorado. If dead or alive, any information will be thankfully received by Will B. Cameron, 409 Main St., Seattle, Wash.

Charcoal Burner wanted. Must speak Spanish and be capable of burning 1200 cords of mesquite per month into charcoal for smelting. Healthy part of Sonora, Mexico. Salary $100 gold per month. Only sober man need apply. References and record of experience required. Address C. Coal. this office.

INFORMATION WANTED regarding whereabouts of John R. Williams, about 70 years old. Last heard of as Supt. of a mine in Copper's Hill, Vermont, in 1866. Has an adopted son about 32 years old. Supposed to be placer mining in the West, possibly California. $25.00 reward at Deseret News Office, Salt Lake City, Utah.

REFRACTORY ORES WANTED.

1000 TONS or more which will assay $75.00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.

C. J. TALLON,
308 MARKET STREET, SAN FRANCISCO, CAL.

WANTED.

—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - - 320 SANSOME STREET, SAN FRANCISCO.

FOR SALE.

Two Second-Hand PUNCHING MACHINES,
SUITABLE FOR PIPE MAKING.
FRANCIS SMITH & CO., 46 Fremont St., San Francisco, Cal.

FOR SALE.

A JACOBS CONCENTRATOR, been used about four months.

Also a fine O. & S. ENGINE, 25 H. P.

25 H. P. BOILER, used about six months, in good order and condition

Also a 40 H. P. ENGINE, now running and can be seen in motion.

Address E. D. BAKER, YREKA, CAL.

Second-Hand Mining Machinery and Supplies OF ALL KINDS.

Send for Catalogue.
THE S. H. SUPPLY CO.
22nd and Larimer Sts., DENVER, COLO.

FOR SALE.

Lease and Bond, Eighteen Months, Easy Terms, Copper Property, New Mexico.

High grade ore with good gold values. Accessible. Plenty wood and water. Strong vein. Three shafts. Will pay from start. Adjoins large producing mine. **H. B. RUNKLE, El Paso, Texas.**

FOR SALE.

One 10″x12″ Double Cylinder, Double Drum Mine Hoist.
One 14″x30″ Duplex Air Compressor, Corliss Steam ends.
Two 54″x16′ Return Tubular Boilers.
One No. 6 Llewellyn Feed Water Heater.
One 36″x9′ Air Receiver.
One Duplex Boiler Feed Pump.

All in good working order and nearly new. Also Rock Drills, Sinking and Station Pumps, Air Pipe, Ore Cars, Skips, Wire Rope, Blacksmith and Carpenter Tools. A bargain for anyone wanting an up-to-date mine equipment. Address Box 376, this office.

THE ERICSSON SWEDISH TELEPHONES HAVE BEEN IN USE OVER 20 YEARS. THEY ALWAYS TALK. GIVE THEM A CHANCE TO TALK TO YOU. CATALOGUES FREE.

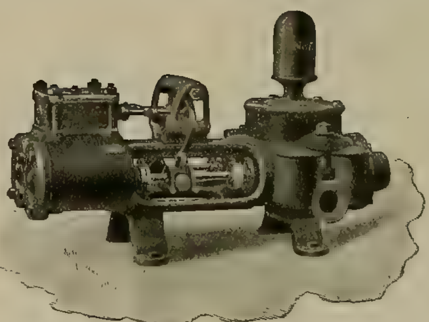
The Canton Duplex Steam Pumps

For Mines, Elevators, Ice Plants, Water Works.



FIRE AND GENERAL SERVICE PUMPS OR BOILER FEEDING IN POWER PLANTS.

GLOBE IRON WORKS,
General Agents, STOCKTON, CAL.
—SEND FOR CATALOGUE.—

POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily repacked.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.
Send us your inquiries.

Dredging for Gold.

ELEVATOR BUCKET DREDGE, "COL. GORDON," WORKING IN MONTANA.

The first elevator bucket dredger operated in the Northwest was built at Bannack, Mont., on Grasshopper creek, in 1895, by H. J. Reiling and others, was named the F. L. Graves, was rebuilt in 1896 and became successful in 1897. That same year the dredger A. F. Greater was built and was a success from the start. Then followed the dredgers Maggie A. Gibson, Bon Acord and Geo. F. Cope, all located on Grasshopper creek, below Bannack. These dredgers met with varying success. The Maggie A. Gibson ran into poor ground, was finally dismantled and moved to Ruby valley, Mont. There was practically no prospecting done in Grasshopper creek at Bannack, the creek being too wide to admit of tests, pitting or drilling. A. F. Greater felt sure there was gold there, for he had been there since the early 60's and had seen much gold taken out with the rocker and sluice box in the shallow workings. He secured favorable ground and made considerable money. The dredger Geo. F. Cope is now reported to be a success after a year's work in changing and reconstructing the machinery to adapt it to handle the ground in a proper manner.

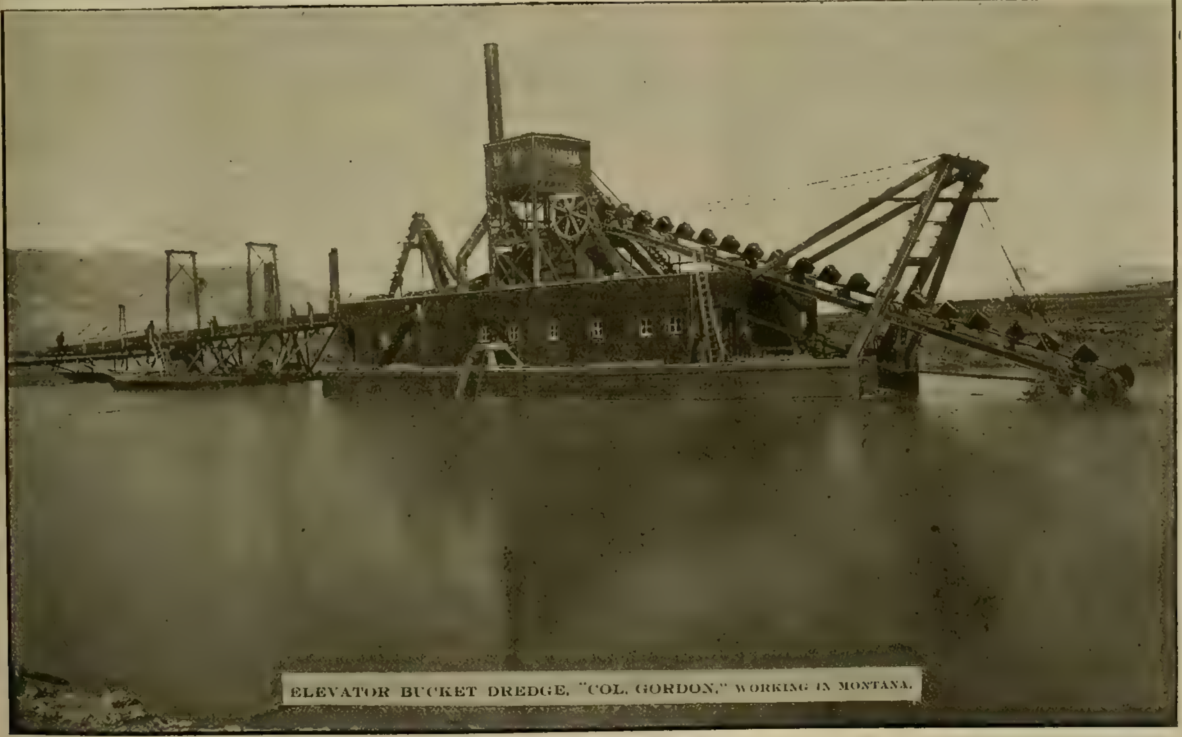
These particulars concerning the Bannack dredgers are mentioned to show the necessity of careful inquiry and study of conditions surrounding a placer property, as well as systematic and intelligent prospecting. During the past two years a number of elevator bucket dredgers have been put out in other States, and are under successful operation. The North American Gold Dredging Co. at Breckenridge, Colo., have two elevator bucket dredgers at work in 40-foot ground. The Boise Dredging Co. of Philadelphia have three elevator bucket dredgers near Centerville, Idaho, in the Boise basin, in 28-foot ground. These are all operated by electric power. The Horse Prairie Gold Dredging Co. have a new elevator dredger—the Isabel Brenner—in operation at Horse Prairie, 18 miles west of Red Rock, Mont. The Pacific Gold Dredging Co. of Chicago have a large elevator dredger near Salmon creek, Idaho, working on the McNutt placer grounds.

The Conrey Placer M. Co. of Boston, Mass., J. Baier Supt., have a large single lift elevator dredger, working in Ruby valley, at the mouth of Alder gulch, 7 miles from Virginia City, Mont., in 30-foot ground. Two views of this dredger, the Col. Gordon, in operation are given on this page, as built by the Vulcan Iron Works, Toledo, Ohio.

The Boston & Idaho Gold Dredging Co. of Boston, Mass., have operated a Risdon dredger at Idaho City for the past two years, having met with good success after the first few months of trial in 20-foot ground.

There are about twenty dredgers working in California, up the Sacramento valley, from Folsom, on the Feather river, northward. At or near Oroville there are nine dredgers, of which five are elevator dredgers.

The new Vulcan elevator bucket dredger is designed to be fitted with buckets holding 10 cubic feet each, to have capacity to dig 5000 cubic yards of material every twenty-four hours. This dredger will have about 300 H. P., will be equipped with modern engine power, surface condenser, steel gearing and sprocket wheels, steel tumblers and bucket chains, ball-bearing grizzly, steel sluice boxes and electric light plant, the hull to have water-tight compartments, length about 120 feet, beam 44 feet, draught 4 feet. The great aim is to secure careful survey of the ground to be worked and then build a dredger suitable therefor, to avoid the expense of changing and reconstructing the dredger after it has started to work, which is always painful and discouraging work. A dredger that will work successfully from the start is the one prized by those who invest in such ventures. Profits in elevator dredging depend on the richness of the ground and economy in operation.



ELEVATOR BUCKET DREDGE, "COL. GORDON," WORKING IN MONTANA.

"IT is snowing hard and the prospectors are coming in," says a letter from a Northwestern mountain town. In California the prospector in many localities can keep on through the fall and winter, but in many of the mountainous regions of the metal mining States his movements are governed by the snow. When it begins to disappear from the foothills in the spring he is off with his outfit and horse or burro, and through the summer is busy. When he starts he has mostly food supplies, cooking outfit, and a few simple mining tools; when he returns he has mostly samples of ore, and the local assayer is kept busy. He works through the winter, grubstakes himself or gets some one to put up for him and starts off again; he always sees riches ahead, and though those riches do not always materialize, who shall say that he does not get as much enjoyment from their prospect as the weary-eyed, overworked city man who ofttimes has the money without being able to stop long enough to enjoy a little of it. The prospector is the best friend of the miner, and of the man who makes mining machinery. He creates the domain that they enter into and enjoy. Upon his failure or success depends the prosperity of many people. He is the pioneer in all mining operations and is the faithful and efficient ally of everything connected therewith.

◆

UNIQUE among gold mines is the Mount Morgan property, Queensland, Australia. The receipt of the annual report of the directors recalls attention to this singular mine. Ten years ago the "mount" was about 1600 feet high, cone-shaped, made up mostly of finely comminuted matter. Working from the top downward, the hill is being dug away, in its entirety, being now cut down to about 1400 feet height. Every ounce dug out is treated, gold being disseminated throughout in particles even finer than in the banket of the Rand, South Africa. During the year for which the report was made out—June 30, 1899, to June 30, 1900—there were treated 239,276 tons. This was classified as 59.20% "low-grade oxidized ore;" 16.02% "medium grade oxidized ore;" 11.22% "high-grade mundic ore;" 13.56% "low-grade mundic ore." All the 239,276 tons averaged 15½ dwts. gold per ton—63.34 shillings, $15.41. Out of the year's receipts the company paid £350,000 dividends. The treatment process, technically considered, has been fully given in these columns. The supply of material to be so treated is the measure of the cubical contents of the mount itself. As the top of the hill is cut away and the men go deeper into the mass of the mount the material does not "grow rich with depth," as is so often said about a mine's workings, but appears to deteriorate. The average value of the ore treated in the past year was 1s 9d per ton less than the average value of the previous year's tonnage.

State Mining Legislation.

The several State Legislatures that will shortly convene have among their newly elected members many practical mining men fully acquainted with the needs and requirements of their constituents, and it is probable that some beneficial legislation will result therefrom this winter. In general it may be said, as of other governmental functions, that men are governed best who are governed the least, and ordinarily the best encouragement to the miner is to not attempt to hamper him with legislation. There are a great many absurd rules and restrictions that vex and annoy, and in this case, as in others, it is more a question of needs than of suppositions. To those, however, who realize how fast this west half of America is filling up, how greatly the ranks of working miners are increasing, and with what giant steps the mining industry is advancing, it will probably be apparent how necessary are some additional legal requirements concerning the owning and operating of mining properties. There are a great many suggestions sent in as to what is and is not required concerning such legislation, and among other recommendations from men who by reason of their positions and experience should know what they are talking about, it is believed that in the interest of the miner there are a few general measures that might with propriety be advocated.

Among the measures proposed are the creation of a commissioner of mines for each State and Territory, with due authority delegated to enforce sundry legal regulations for the removal of explosives from general supply stores in mining camps where there is no municipal law governing the storage of the same, or in mining camps not incorporated; that no engineer in charge of any hoisting works or who, in addition to other duties, hoists and lowers men shall be employed to exceed eight consecutive hours in each twenty-four; that no one under 18 years of age be so employed, and that any one acting in such capacity be required to have a license properly issued by a duly appointed board.

Regarding this last suggestion things are beginning to run somewhat loosely. It is conceded by all that the engineer, or call him what one will, the man who has charge of the lowering and hoisting of workmen in a mine shaft, occupies a very responsible position, one that requires considerable intelligence and constant vigilance, and to avert accident no one ignorant of at least the rudiments of the requirements of such a position should be so employed. Of all men the engineer should not owe a position to any "pull," and yet it now sometimes happens, as many miners know, that the man who has been tried in other positions around a mine, and who has demonstrated his inability or incapacity, is finally put to lowering and hoisting men and in charge of the engine. This, however, is likely to occur, only in a small mine in an isolated locality.

In California and Montana there is a compulsory system of mine bell signals which every engineer must observe in those States, and is supposed to know, though in some instances the supposition is not warranted. This comes under the head of the duty of the State to protect its citizens, even though some of those citizens may object to such protection.

Some other suggested requirements are that abandoned shafts, pits or other excavations likely to endanger the life of man or beast be properly covered over or fenced in; that in all shafts equipped with two cages no engineer shall hoist or lower more than one cage at a time; that the speed at which men are hoisted and lowered shall be regulated; that mines hoisting material from two or more levels shall employ a man as cager, whose duty it shall be to unload and attach, and give all signals to the engineer; that all mining superintendents make monthly or quarterly reports to the properly constituted State institution of the condition of the mine; that all working mines keep up a set of working maps, both plan and section, which shall be open to inspection by officers of the State Mining Commission, such maps to be compiled by a competent mining engineer at least twice a year; that local inspectors be appointed in the various mining camps whose duty shall be to examine into and report upon expenses when so instructed by the commissioner of the mine; that there shall be prohibited the use of iron, steel or other metal bar in tamping; that laddered ways be partitioned off and be separate and distinct from the main working shaft; that guard rails or gates be provided at station levels; that provision be made for leaving a pillar of ground around the main working shaft sufficient to insure safety; and that an official bureau of mining information be created, to which corporations and individuals owning mines should be required to make regular reports.

To these and such as these will be made considerable objection. It is not to be understood that this paper endorses all or any of the above suggestions. They are just what is found in the minds and on the tongues of a good many men everywhere throughout the mining region, and are here given place for what they are worth. That additional mining legislation is necessary is manifest because of the increasing importance of the industry, the greater number of men actively engaged in mining and because of the absence in so many cases of legal safeguards. In general, the objection to such legislation may be stated in the expression of opinion from some sources that it is not the business of the public nor is it the business of the State to attempt any parental supervision of such things, nor is it in accordance with public policy or requirements to compel any one to make report of his private business, or admit of its regulation.

The obvious answer to such objection would be that the State is paramount, that it is the duty of the State to make all required safeguard for the lives and property of its citizens and that the public have rights that must be respected; that when a portion of the public domain is given to any individual or corporation, the development of that part of the public domain entitles all those interested in mining to at least a general outline of results; that while it is not fair to the individual to expect that he shall give a detailed account of his private business, yet for the general good certain fundamental data and phases of development should be reported; that competition can in no way injure the business of the gold miner and that ordinarily where men are doing a legitimate business there is no objection to the affording of information as to development and operation generally.

It is also probable that there will be considerable brought up in the Legislature this winter of proposed mining legislation in the way of State and Territorial laws concerning the locating of claims, work thereon, etc. Inasmuch as federal mining law is supreme in all those cases, it is always well to have as few State limitations as possible, and it is a matter of necessity that any mining legislation be so fairly and plainly presented that its passage will not be, as in so many recent cases, the signal for universal demand for its repeal.

Nothing Wonderful==in California.

At the Humboldt County Bank there is a gold nugget—a chunk of virgin gold of irregular shape and knobby surface — whose longest axis measures 3 inches, with an extreme width of 1¾ inches and an extreme thickness of 1¼ inches. Its weight is a little over eleven and one-half ounces. It was picked up on the Peterson Bar mining claim, in Eddy gulch, a tributary of the North Fork of the Salmon, in Siskiyou county, and was sent to the bank for sale or deposit to the credit of the owner of the mine, C. A. Peterson of Rollins, in that county.—Eureka Standard.

The above is from a California "country paper." It is an ordinary notice that attracts little attention. But if such a "chunk of virgin gold" were "picked up" at Nome, or Tierra del Fuego, or some other far-off region of eternal ice and night, what a furore! How it would be photographed, and what columns would be written about so wonderful a nugget of gold! But in California it is just a common, ordinary eleven-ounce nugget, worth probably $200 or so, "picked up" in a placer claim, given a few lines in the local paper and taken as a matter of course, the same as the trees or the climate.

Concentrates.

SELENIUM is considered insoluble in liquid ammonia.

A REFINERY will be built at the Northport, Wash., smelter in 1901.

THE "Oregon Mining Stock Exchange" at Portland, Or., is comatose.

A CUBIC FOOT of dry oak wood weighs 59 pounds; of steel, 490 pounds.

A BELT pulls harder, or with less strain, with the grain side next the pulley.

BRITISH COLUMBIA smelters value copper in the ore at about $2.25 a unit.

TRY sal ammoniac in the boiler for boiler scale, if occasioned by carbonate of lime.

THE back pressure per square inch on the plunger of a pump that is raising water 175 feet is 75.6 pounds.

PROBABLY two-thirds of the copper now produced in the United States is refined by the electrolytic method.

TO THE 1st inst. the total gold output of Cripple Creek, Colo., has been $104,917,586. The October output was $1,956,900.

A SAW has recently been invented in San Francisco that will rip and plane lumber at the same time with one handling.

ARTICLES of a practical nature, illustrated or otherwise, of interest to miners or metallurgists, are always gladly received.

SUNDAY begins at midnight following the preceding day at the meridian of 180° east or west of the meridian of Greenwich, England.

FERRO-CHROME is a 50% alloy of iron and chromium, used in making shoes and dies for stamp mills and in the manufacture of tool steel.

THE ninth annual convention of the California Miners' Association will be held at Golden Gate Hall, 625 Sutter St., San Francisco, beginning 10 A. M., Nov. 19th.

A CUBIC FOOT of solid carbide weighs 137 pounds, and if of commercial purity would yield 685 cubic feet acetylene, having a thermal value of about 232,200 calories.

SEA WATER contains about 5 ounces salt to the gallon. At a temperature of 39.1° F. a gallon of sea water weighs 8.565 pounds. Sea water at sea level will boil at 213.2° F.

THE rocks forming the earth's crust have a density of about three times that of water, increasing with depth, the temperature rising about 1° C. for every 90 feet of depth.

IN the U. S. standard of board measurement, by 1000 feet is meant superficial feet, or the amount of lumber required to cover 1000 square feet of surface with boards 1 inch thick.

GOOD SALESMANSHIP is agreeable, adequate representation of goods in the presence of both goods and customer. Good advertising is the same thing in the absence of goods and customer.

SPECIALLY MADE gas engines are now built from 3 H. P. to 150 H. P., capable of producing from 50 to 1500 16-C. P. incandescent electric lights when belted to a dynamo of the proper capacity.

PROBABLY the next general improvement in the gas engine will be the more common use of high compression, which occasions increase in fuel economy, and, likewise, increase in the power of the engine.

THE calculated flame temperature of average coal gas burned in air is about 4860° C., or 5133° absolute. In the gas engine the rise in pressure does not indicate a temperature exceeding 1900° to 2000° C., absolute.

A single-acting pump is capable of doing good service, but it is to be borne in mind that for a given duty the water piston of such a pump must have double the area of a double-acting pump, assuming the strokes to be equal.

FOR marine boilers fusible plugs are made of Banca tin. Where it is desired that the fusing point shall be 200° F., the fusible compound may be tin 25 parts, lead 25, bismuth 50; where 208° to 212° F., tin 19, lead 31, bismuth 50.

IN the case of a boiler "72 inches diameter, double-riveted lap seam, $\frac{11}{16}$-inch rivets spaced 3 inches between centers, thickness of plate $\frac{9}{16}$ inch, of 60,000 pounds tensile strength," the safety valve should be set to relieve the boiler at 130 pounds.

WITH proper and necessary arrangement there is no reason why an isolated electric lighting plant should not work satisfactorily and economically. Any reputable electric supply company will gladly furnish full details and estimates of cost and results.

THERE is nothing in the U. S. mining law requiring the locator of a mining claim to make application for U. S. patent therefor. He can hold it for twenty years, if so disposed, by complying with all requirements pertaining to unpatented mining claims.

THE silver on an electro-plated plate wears off in a time directly proportionate to the grade of the ore run over it—the lower the grade the quicker the wear. Barren ore run over a well-coated copper plate will abstract some of the amalgam from its surface.

THERE are beds of rock salt near Danby, San Bernardino county, Cal. At Salton, in the same county, salt is produced by natural evaporation, and on the north shore of San Francisco bay about 10,000,000 pounds of salt are annually produced by evaporation of sea water.

IN a zinc-lead ore carrying iron sulphides there should be no serious difficulty in separating the latter by concentration, there being considerable difference in the specific gravities, and it is on this matter of difference in specific gravity that all ore concentration is based.

MOST men in putting on a new hoisting rope, flat or round, pass it through a bath of hot lubricant—a bushel of freshly slaked lime to a barrel of coal tar is a recommended mixture. If pine tar is procurable, tallow can be used instead of lime, as there is no acid in pine tar.

"CLEARANCE" in an engine means all the steam space between the valve and cylinder and between the cylinder head and piston when the latter is at the end of the stroke. Piston clearance is the distance the piston clears the cylinder head when the crank is on the dead center.

ABOUT 1,500,000 tons sulphuric acid were used in the United States last year. Of this amount 50% was used in the manufacture of kerosene, 35% in the manufacture of fertilizing material from phosphate rocks, 15% in the arts, galvanizing iron and steel, and dynamite manufacture.

CRIPPLE CREEK, COLO., is the greatest gold mining center in the United States; Butte, Mont., has probably the largest number of residents actually engaged in mining of any one American city; Houghton county, Mich., has about the greatest developed system of mining of any county on the continent.

WHETHER a steam engine will work better in the rain or the sunshine is a difficult question to determine. It is manifest, however, that the drier the weather the more liability there is to boiler scale, for in times of drought the water is drawn from lower levels, impregnated with mineral, in wetter seasons from surface or soft water.

IN nearly all forms of metal mining the British colonies in the South Pacific are prominent. As types may be mentioned: Mt. Morgan, gold mine; the Broken Hill Proprietary, silver; the Bischoff, tin, in Australia; the Mt. Lyell, copper, Tasmania. The Hartley & Riley, dredging, New Zealand, instances the profit in placer propositions.

FLAT WIRE hoisting ropes are in favor on the Comstock, Nev., at Butte, Mont., in Tintic district, Utah, and two or three other localities. Round ropes are in more general use. Flat ropes range in width and thickness from $2\frac{1}{2}$x$\frac{3}{8}$-inch to 9x$\frac{7}{8}$-inch. A round steel or iron wire rope, to hoist a 5000-pound load, should be not less than 1-inch diameter.

THE advantage of a compound over a simple engine is chiefly the reduction in cylinder condensation, thus making it possible to expand the steam to a lower pressure without loss, and, therefore, with a gain in power, thus enabling the compound engine to develop more power with the same weight of fuel, or the same power with less fuel than the single-cylinder engine.

REGARDING the silver yield of the Butte, Montana, copper mines, the silver deposits were developed mostly north of the west end of the copper area, where in former years large quantities of silver were produced. In the copper produced from the ores of the copper area about 3% of the value is in gold, and the average proportion of gold to silver by weight is $\frac{1}{200}$ to $\frac{1}{300}$.

THE "bucking and snorting and refusal to start" of the gas engine may be due to moisture in the cylinder, which often prevents regular ignition till dried by the heat of several explosions. By shutting off the water jacket a few minutes before stopping the engine, and not turning it on again till after the engine begins to explode regularly when again started, the difficulty may be obviated.

"DISPLACEMENT" refers to the quantity of liquid displaced by the immersed hull of a vessel, and "tonnage" to the freight-carrying capacity of the ship, determined by certain rules of measurement. The displacement of a vessel is the entire weight of the hull with all its contents, as a floating body displaces a weight of fluid just equal to its own weight. A ship sinks in the water to such a level that the pressure of the fluid displaced exactly counterbalances the weight of the ship.

NEXT to the Rio Tinto of Spain, which has produced copper ore for nearly 2000 years, the oldest producer of copper in the world is probably the Falugrufva mine, near the town of Falum, in central Sweden. The mine is first mentioned in public records in the year 1220, A. D., but is much older than that. The oldest privilege belonging to the mine is from King Magnus Ericcson, and is dated February 24, 1347. The ore contains 3% copper, but has proved profitable.

IN "Concentrates" in the issues of Oct. 6th and Nov. 3rd, 1900, were directions how to make sodium amalgam. A Breckenridge, Colo., miner writes: "The sodium amalgam must be freshly made to be effective. If kept long it oxidizes. Metallic sodium may be kept in wide-mouthed bottles covered with coal oil. Enough for a single cleanup can be made in a small frying pan. A small quantity of mercury from a fresh flask is poured into the pan and dried with a sponge and then heated beyond the boiling point, but not enough to volatilize the mercury. A piece of sodium is cut into $\frac{1}{2}$-inch cubes and the mercury taken out in the open air. A cube of sodium is placed with tongs in the center of the warm mercury. A flash follows; a small portion of mercury is volatilized and another cube of sodium is placed with less flash. This is repeated three or four times, when the sodium sinks down gently. At the proper moment a solid mass of amalgam will appear in the center. The contents of the pan are then stirred, and a few more added cubes change the whole to a mass of crystallized sodium amalgam."

LINEMEN say that in setting telegraph and telephone poles remove the earth around the poles 2 or 3 inches from the poles and about 3 inches deep, and pour a gallon of tar oil around it, so that the pole is tarred just above and just below the surface of the ground, and then put back the earth. In southern California the earth is dug from around the poles to the depth of a foot, and about two gallons crude oil having been poured in and allowed to settle and soak, the earth is put back again and tamped. In some localities the Bell Telephone and Western Union companies, using large round poles, dig narrow channels from 2 to 3 feet deep around the poles and fill the channels with rock salt for surface preservation.

ONE advantage of a power pump and a driven well in connection with a good heater is that all of the pumping must be done before the engine is shut down, which means that exhaust steam is passing through the heater, and no cold water can reach the boiler. An injector is convenient in such a plant, because it may be run to fill up the boiler after the engine is shut down. In many places this is a necessity, because boilers cannot be filled up as they should be at night without causing water to be thrown over into the engine cylinder and causing trouble there. The water from an injector is always warm, but if a larger one than is actually necessary is secured a valve may be placed in the suction pipe, and as the water supply is throttled the delivery becomes warmer, which is better for the boilers.

IN the case of Jordan et al. vs. Duke et al., rendered by the Supreme Court of Arizona, April 16, 1898 (53 Pac. Rep., 197), it was held that "when parties located a mining claim, but did not work thereon to hold it until December 31st, when they went on the claim and worked that day and the next five or six days of the succeeding year, and then abandoned the claim without having performed all the work required by the statute, other parties who made a location of said mine on the first day of the year, before the prior locators had stopped work, acquired no rights thereby, as they should have waited until the prior locators abandoned their work, and, the land at the time of their location not being subject to location, their acts cannot relate back to when it became subject thereto by reason of such abandonment."

IN the location of a mining claim the discovery cut and stakes are monuments, but a record of a mining claim "calling for its own discovery cut and its own stakes is defective when it contains no reference to a natural object or permanent monument to fix the locality of the claim." (McEvoy et al. vs. Hyman, 25 Fed. Rep., 596.) Where the notice calls for its own stakes and for adjoining claims may be good if such claims are found on the ground with definite corners and boundaries. (Russell vs. Chumasero, 4 Montana Rep., 309.) In the case of Drummond vs. Long, 9 Colorado Rep., 538, the lode was described as being on the southwest side of Mount Hardin and in Portland gulch, and about 1500 feet north of the Hawk Eye lode, and the court held that this reference located the lode generally, but was not that definite location, by reference, which the statute contemplates.

"CONCENTRATES" was in error in the issue of November 3rd in a statement regarding the mining law of Mexico. Article 5 of Title I of the present Mexican mining law says: "The title of all mining property * * * shall be perpetual and irrevocable, provided that the federal tax * * * is duly paid." Article 22 of Title IV says: "* * * In all other respects the owners of said properties shall enjoy complete liberty of industrial action and shall be allowed to work their mines in the manner which may be more suitable to them, or to hasten, delay or suspend the labors, employ the number of laborers which they may deem best or concentrate their efforts in one place with preference to other. * *" The annual tax is $10 in Mexican silver per claim of a square of 100 meters on each side, payable in advance every four months in three equal amounts. There is no tax on the output or earnings of a mine; but in case of taking the ore or bullion out of Mexico, an export duty is levied.

ALL coal deteriorates or decays to a more or less degree by disintegration or crumbling, and also by the gradual combustion of the volatilizable element. Atmospheric oxygen is absorbed and converts the hydrocarbons into water and carbonic acid. It has been proved in one case, according to Clarke's "Rules, Tables and Data," that bituminous coal, after having been exposed for nine months, lost half its value as fuel; coal exposed for three months to a temperature of 284° F. lost all its hydro-carbons. The coke manufactured from coal thus deteriorated is inferior to coke made from coal freshly mined. The decay of coal proceeds more rapidly in hotter climates; dryness is unfavorable to the change, while moisture accelerates it. When sulphur or sulphurate of iron is present in considerable quantity in coal which is changing under the action of the air a second powerful heating cause is introduced, and both, acting together, may produce spontaneous combustion. The presence of sulphur or iron pyrites, if in considerable quantity, is sufficient to excite combustion.

The Oil Fields of Kern County, Cal.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by H G. PARSONS

McKITTRICK DISTRICT.—The McKittrick oil district is located in the Coast Range mountains, southwest of Bakersfield, with which it is connected by a railroad 48 miles long. The railroad was built before there was much development of the petroleum interests of the locality. Although petroleum was known to exist there, by reason of oil springs in the hillsides, it was the asphaltum deposits which induced the building of a railroad. Vast deposits of this material—which is nothing but petroleum with its volatile gases liberated—tempted enterprising men to take commercial advantage of the natural conditions here existing. A refinery was established, and asphaltum was shipped in great quantities. It was mined from veins, like coal, or taken from flat beds where the petroleum had exuded from the ground and was left as a dirty residuum. A small settlement sprang up, called Asphalto, where the works were situated. The refinery was run until last November, when a majority of the stock was absorbed by a competing company, and the works were closed down. It is doubtful if they will ever be reopened, at least so long as the supply of petroleum holds out, for a better article of asphaltum is now made from crude petroleum than can be mined from the ground, and the distillates obtained by the latter process more than offset the increased expense of manufacturing the superior article.

The town of McKittrick is distant 1 mile from Asphalto. There is an asphaltum bed back of McKittrick, and in it deep trenches have been cut. There is a constant seepage of petroleum into these trenches, and this is pumped out every few days. At another place in the canyon, a short distance north of McKittrick, there is a stream of crude petroleum oozing out of the soil and flowing sluggishly down the hillside. At places along this flow one can pick up chunks of pure asphaltum.

It is not surprising that in a locality abounding in such evidences of the existence of petroleum wells sunk into the heart of the earth should tap the fountain head and produce oil in great quantity. The wonder would seem to be that this work was not pushed more thoroughly years ago, as at Sunset, where the surface indications are hardly as great. W. J. Berry and associates were the first successful developers of oil in the McKittrick district. Two or three wells had been sunk in 1892–93 by the Buena Vista Oil Co., but the production never exceeded twenty to thirty barrels per day, and this was supposed to be seepage oil. Messrs. Berry and associates leased land from Italian owners in San Francisco and from the Kern Valley Bank, and in February, 1899, began the sinking of wells. Their lease with the Italians was to extend for six years, with option to purchase in three years at $200 per acre. With the Kern Valley Bank the lease was to run for ten years, with option to purchase at $225 per acre within five years. The royalty while the lands are under lease is to be one-eighth. Mr. Berry, W. M. Spencer, T. L. Keller, W. I. Roberts, Clarence Berry and Milton McWhirter formed several companies, the best known of which is the El Dorado. These companies have sub-let a large part of their holdings to the S. P. Co., to Dabney Bros. & Miley, to the Kern River Oil Co., to the California Standard Oil Co., and to the Giant Oil Co. They are receiving a larger royalty from each of these companies than they pay to the original lessors, and at the present rate of production they will not only be able to buy the land with the proceeds of their royalty, but may become oil magnates without turning a hand toward further development. They own or control some of the richest oil lands in the State of California.

The place selected by the El Dorado Co. for their first wells was near one of the asphaltum deposits. Other local indications of petroleum were plentiful. The company merely went deeper than some of the earlier workers in the district, and they were rewarded by striking oil sand from which the petroleum forced itself over the top of the casing. The oil belt in this immediate vicinity is hardly more than 1200 feet wide, as has been demonstrated by dry wells sunk outside of those limits. The trend of the belt is northeast, and, so far as can be judged, it grows wider in its northward course. It has already been defined for a distance of 3 miles in a northerly direction, and extends from the hills at least into the mesa lands adjoining. Whether it can be traced far into the flat remains yet to be determined. In a southerly direction from the El Dorado wells the conditions are also uncertain, as there have been several failures to locate the underground stratum along a line in conformity with the northerly trend. The limits and direction of the trend must be decided by trial, as no geologist or expert can settle such matters as unerringly as does the drill of the well borer. It is a "hit or miss" proposition with the best of them.

The Southern Pacific (or Treadwell) Co. have five producing wells at McKittrick, one of which flows steadily, the others intermittently. There are pumps on each of these wells, as in most cases a well will yield more by pumping than if left to flow naturally. This has been an exception in the case of a so-called "gusher." The average depth of the S. P. wells, which are located in the best part of the McKittrick field, is 650 feet. The stratum of oil sand is 250 to 500 feet thick. The total yield from the company's six wells is 300 barrels per day.

The Dabney Oil Co., who lease from the El Dorado Oil Co., have four producing wells, one of which is probably the best producer in all of Kern county. It was a great gusher when first struck, and has flowed constantly since, though with intermittent force. Two other of these wells are intermittent flowers. If anything happens to the pumps the oil soon boils over the top of the casing. The total product of the Dabney wells is 600 barrels per day. The company were perforating three wells at the time of my visit, and had four rigs at work drilling. Their operations are characterized by much energy, and they have given new life to the district. Dabney Bros. and E. J. Miley compose the company.

The California Standard Oil Co. is a close neighbor to the Dabney, and they also own land in the northern part of the field—200 acres in all, mostly along the supposed oil belt. They have two producing wells and one drilling. Their output amounts to 110 barrels per day; tankage capacity, 10,000 barrels. This company make an excellent showing for the one year in which they have been operating at McKittrick.

The Kern River Oil Co., who are also fortunate enough to be in the productive belt, have three producing wells, another on top of oil sand at 800 feet, and a derrick built for still another well. The product is variable, as the wells flow or yield intermittently. At times they produce 400 barrels each per day. One of the Kern River Co.'s wells is the best producer yet struck in the northern part of the field.

The Giant Oil Co., in the northern part of the field, have two producing wells.

The McKittrick Oil Co., also in the northern portion of the belt, struck oil sand at 700 feet, and are now 200 feet in the stratum; are preparing to sink another well.

The McKittrick Consolidated, in the same locality, struck oil sand at 850 feet.

The San Francisco & McKittrick Oil Co., northwest of the McKittrick Co., have one producing well; bored a second, but injured their casing, so abandoned that, and are now sinking a third.

The Pacific Crude Oil Co., located in the hills in the northern part of the field, are in oil sand and will soon have a producer.

The Del Monte is in the same locality; are now in oil sand, but on account of trouble with casing are not producing.

The Belmont is located next to the McKittrick & San Francisco; now drilling.

Toward the Temblor district, some miles to the north, are several ventures. The Adirondack is drilling. The Gould & Central is down 800 feet, in soft oil mud, from which a seepage of twenty barrels per day can be obtained.

In the Temblor district itself four wells have been completed or are in oil sand, while four more wells are in process of drilling.

The McKittrick district is the seat of considerable activity, and promises to be a great producing section. Five carloads of oil were shipped the day I visited the camp, and that is said to be the amount usually sent out.

Leaching Copper Ores.

At the Petoskey mine, northern Arizona, the ore occurs in a blanket vein and yields 12% copper, two ounces silver and $1.80 gold per ton. The formation is siliceous, of volcanic origin, the copper occurring in green and blue carbonates, silicates and sulphides. Ordinary methods of leaching do not properly reach the silicate of copper, hence the special process employed at the new plant on the property. The method which has been resorted to consists in fine pulverization, especially shaped, self-dumping digesting vats of prepared wood to resist the chemicals, a solving solution to solve both copper and silver, but immediately precipitating the latter. Some iron will also go into the solution if any be present in the ore.

The prepared chemical solution is made to wash out the copper from the first digesting vat of pulverized ore; its chemical energy is exhausted by passing it through successive vats of ore until desired result is attained, when it is diverted to the precipitation vats or cells containing metallic iron, specially arranged and electrically connected with cathodes of copper, by which the copper in solution is electrolytically deposited, ready for market.

The chemical solution, having first united with the copper in the ore, leaves it in the precipitating cells by uniting with the iron, flowing first through these cells as an iron solution to large, shallow cisterns or wells, where, on cooling, crystals of iron salts are formed. These are retorted and the combined chemical recovered, to be used again in the solving of the copper from the ore. The iron, also specially treated, is used again.

The silver, having been left behind with the ore in an insoluble condition by the chemical solution used to extract the copper, is now treated with a hot, saturated solution of common salt (the ore having previously been washed by water to recover the chemical solution), whereby the silver is taken up and carried from the ore to the silver precipitatory vat, where, on cooling, most of it is deposited as chloride. The brine, being used only for this purpose, is pumped to a higher vat, ready, on reheating, to be used again.

The gold yet resides with the ore, which is now dumped from the vat, and, by suitable conveyor, discharged into a specially devised amalgamating apparatus and the gold retained, while the pulp is passed away to the dump.

Primitive Mining Methods in the Philippines.

Native mining is primitive at a gold mine in the Benguet district; the mountain is seamed with quartz veins from a few inches to 5 feet across, all said to be gold bearing; yet the Igorrote miner has never got beyond the oxidized ore of the surface. He takes an iron pike—a simple stick, shod with a steel point 6 inches long—and with this strikes and pries out blocks of disintegrating rock. Perhaps during his working period, which seldom lasts more than two hours a day, he detaches twenty to forty pounds of quartz, which he carries down the gorge to his home for the next operation of crushing. A miner succeeds, by weeks of this labor, in letting himself into a burrow 10 feet at the most, and then only takes the trouble when the vein is rich, as it necessitates his burning a torch, prepared by the women from thin sticks of resinous pine, which every few minutes smokes him out. A writer says one is disappointed at this method of gold mining and the seams of quartz suggest possibilities for a small stamp mill; but the next stages of crushing and abstracting the gold entirely overcome a progressive mind. From behind a thin shade of boughs, near the houses below, rose a thud, thud, stopping now for an instant, and then taken up again monotonously. Peering behind the screen one discovers an old hag, wrinkled and dried by threescore years of a toilsome life, swinging to and fro from the hips, in her squatting position on the ground, and with her outstretched and rigid arm rocking a slightly cylindrical stone of fifty pounds upon another, larger in size and slightly concave.

Between the faces of these two stones is crushed the quartz. The big pieces are first smashed into lumps as large as a walnut by volcanic boulders, and then these are taken, one at a time, and crushed to coarse dust under the primitive arrastra described. The fairly uniform coarse dust is then fed between the rocking stones, and finally comes out after hours of patient labor as an impalpable powder.

The men are lazy, but the poor old women will sit for hours moving this crusher back and forth, spreading the grinding quartz into new positions with a dexterous swish of the hand, and then, after a day's labor, will have but a scant ten pounds of powder ready for the last operation of "panning."

The panning is done principally in calabashes, or the half shells of big gourds. The powder is placed in the calabash, which is then filled with water. A circular motion is imparted to the water, which starts all the lighter dirt in motion with it.

At each turn of the pan a portion of the water is swished over the edge, carrying out the bulk of the dirt by the time the first water is exhausted. By the addition of water several times and repetitions of throwing it out by rotary motion, nothing but the gold and black magnetic iron ore is left in the bottom of the pan. A still more careful washing takes place in some localities by the use of a second smaller dish, and the iron ore is finally removed, after drying, by the use of a magnet, but in some of the regions to the far north, where the Igorrotes are even more primitive than those of the Benguet district, the black sand containing gold is packed in small tubes of bamboo and sold in this condition at the seacoast to Ilocano and Chinese traders for a song.

What surprises the average American is the total absence of practical machinery for mining, and then, again, that if there are actually valuable mineral properties in the Philippines they have not been exploited and developed long since by the Spaniards and foreign residents of the islands. There seems to be but one possible explanation for this commercial inactivity, and that lies in the defective Spanish laws relating to mining and the development of mineral wealth, which made it possible for the title to mineral lands to revert at any time to the Crown.

No one could possess a known valuable claim without being ruined by Spanish officials, who demanded hush money. No one could import mining machinery without attracting the Government's attention to the fact that an enterprise was about to be established in which the Government might have the lion's share; hence there has been a paralysis of mining industries.

The writer referred to says he has not seen a flume in any portion of the mining region he traversed, though there are miles of deep black sands in the narrow river bottoms which might pay if sluiced out and amalgamated. They have not even got as far as miners' cradles.

Classifying Crude Oils.

At the Petroleum Congress, held in Paris during the Exposition, a paper by Prof. S. F. Peckham, on the "Classification of Crude Petroleum," shows the importance to the commercial world of the scientific treatment of the subject. Prof. Peckham states that in the earlier oil days no attention was paid to the composition of different productions of crude, and shows how the commercial value, in consequence, was injured.

Scientists were at work on the subject of petroleum at a very early date, but Prof. Peckham says, up to 1855, "rock oil" had been regarded by both geologists and chemists as a species, and Prof. Sillman in that year was the first person to observe the destructive distillation of petroleum. In 1868, after making tests with Pennsylvania and California petroleum, Prof. Peckham made known the results of his test to C. M. Warren, an expert petroleum chemist, and was laughed at when he stated that the two products differed in their bases.

"When I assured him," says Prof. Peckham, "that by passing gases through Pennsylvania and California petroleum, that would deprive them of hydrogen, I could evaporate the first and convert the second into asphaltum, he was incredulous, and thought my ideas regarding the origin of petroleum theoretical, without any substantial basis of fact to rest upon.

"Although I had no absolute proof thereof, I was firmly convinced that the California oils consisted of hydrocarbons containing less hydrogen than was found in those of Pennsylvania.

"When, in 1880, I was engaged in collecting the statistics for my report on petroleum to the Tenth Census of the United States, I encountered two significant facts: First, the investigators of Russian petroleum had discovered that the hydrocarbons that made up the bulk of Russian petroleum were not paraffins, but additive benzols; second, a correspondent reported that the refiners of California petroleum were not making an illuminating oil that could be sold in competition with Eastern oil, but were sending their products to Mexico, where they found a less critical market than in California.

"This evidence pointed to sharp distinctions in petroleums from different localities. The wells first struck in Oil creek and the Alleghany river produced a petroleum easily refined into naphtha, illuminating and lubricating oils; and, while the evolution of the technology of these oils required many years, the movement was along certain well-marked lines, wherein no obstacles were encountered to continued success. The process of cracking, discovered by Joshua Merrill while working on the distillates from coal, was applied with great success to the Pennsylvania oils; but attempts to apply this method of distillation to the California oils did not produce corresponding results, although distillation under pressure did increase the yield of light oils.

"This discovery revived in my own mind the conviction, formed many years before, that the petroleums of the Pacific coast were specifically different from those of the Mississippi valley, containing different hydrocarbons and requiring different treatment for their success and manipulation. This conviction led to renewed attempts on my part to persuade the owners of large interests in California petroleum to have made a careful and thorough examination of their crude material, with a view to determining the chemical constitution of the oil, the nature and value of the products, and the best methods of securing these products by treatment. These gentlemen still remained unconvinced of the value of such work."

Prof. Peckham offers a system of classification, arranged on the basis of chemical composition alone. "If it is urged," he says, "that such a system is too intricate for the petroleum exchange, and that commercial differences exist among the petroleums and other forms of bitumen, I insist that commerce has assumed a lofty intelligence above the scientific world, of which the latter can take no account, because there are no points of contact between the two spheres of human activity. There is, however, a limit to this divergence of interest that appears when a petroleum chemist is called upon to examine petroleum from a new locality."

There are now four types of commercial petroleum that rank in commerce relatively as follows:

First.—Paraffin petroleum.
Second.—Russian petroleum.
Third.—Sulphur petroleum.
Fourth.—Nitrogen petroleum.

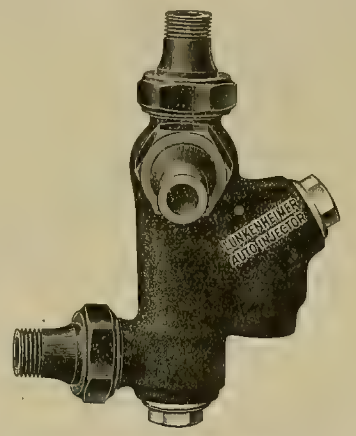
"The differences in these crude oils may certainly be regarded as specific, and they have been established upon the results of very elaborate analytical researches. Perhaps for commercial purposes the bestowal of specific names upon these varieties would not be understood or appreciated, but for the purposes of the laboratory they might be. There is, however, in view of the knowledge we now possess, one aspect of this question that can well be considered and definite action by it urged by both the experts in petroleum and their clients. This aspect is the extent to which the expert or the client is justified in recommending or demanding an examination of a specimen from a new locality, which shall be made by the elaborate, analytical methods employed upon the researches on petroleum conducted during the last ten years.

"A crude petroleum is not necessarily determined as belonging absolutely to either of these types, but it must, I think, approximate one of them. It therefore becomes of importance, not only from the standpoint of pure science, but that of commercial utility as well, to ascertain from the most careful examination the composition and relation of the various compounds that constitute the sample under consideration. This course, while involving more time and expense, is in the end both more economical and more satisfactory than the time-honored expedient of distilling a pint from a glass retort and dividing the distillate into fractions of certain specific gravities, but of unknown composition."

What is being done in refining oil in California is referred to in an article on page 520 of the issue of November 10th, descriptive of operations in Sunset district, Kern Co., Cal.

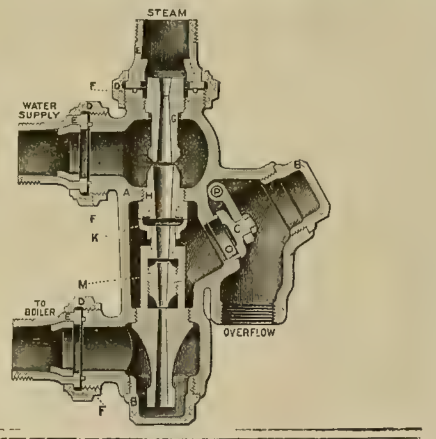
The Lunkenheimer Automatic Injector.

The Lunkenheimer automatic injector, herewith illustrated, is guaranteed by the manufacturers. The body is cast iron, the tubes of a special hard bronze composition made expressly for the purpose.



These tubes do away with spill holes in the walls; the internal areas of the tubes are smaller than some others, for capacities claimed to be equal.

The external appearance of the injector is pleasing, as the entire surface is heavily enameled. The steam, suction and discharge connections are provided with male unions. The joints where the unions connect to the body are made with seamless copper rings forced into grooves cut into the faces of the body part of the injector (see sectional cut. These injectors will operate under the following range of steam pressure and lifts with the feed water at 75°:



Lifts 2 to 4 feet, at steam pressures 20 to 180
Lifts 4 to 8 feet, at steam pressures 25 to 165
Lifts 8 to 12 feet, at steam pressures 30 to 140
Lifts 12 to 16 feet, at steam pressures 50 to 120
Lifts 16 to 18 feet, at steam pressures 60 to 100
Lifts 18 to 20 feet, at steam pressures 70 to 90

With steam pressures at 60 to 100, and feed water at 75°, the capacity of this injector can be graded over 50%.

Further information will be furnished on application by the Lunkenheimer Co., Bank building, Denver, Colo., or Cincinnati, Ohio.

A WRITER in the Australasian Ironmonger says: "I saw a man unpacking some American merchandise the other day, and, being a patriotic individual, I exclaimed: 'Hello, where do these come from?" 'America,' said he. 'Cheaper than English?' said I. 'No.' 'Better?' 'No.' 'What's the reason, then?' 'Americans pack better, parcel better, label better and usually send out plenty of printed matter.' There are more ways than one of advertising; this is an excellent way."

Protecting Shaft Timbers When Blasting.

Written for the MINING AND SCIENTIFIC PRESS by J. P. MUNGER, Supt. Harvard G. M. Co., Jamestown, Cal.

Having had considerable experience in shaft building on the mother lode, I have had the same trouble in protecting my shaft timbers when blasting that doubtless all other mine managers have had. In hand drilling we have but little trouble when proper care is taken; but when power drills are used it is extremely difficult to timber close to the work, as often has to be done in unsafe ground, without the danger of shooting out or damaging our timbers when blasting, and more especially when the electric battery is used.

Experiencing some trouble in this line, I conceived the idea of covering the timbers with a steel plate. It struck me so forcibly as being a good plan that I put it into use as soon as I could make my plans and have them constructed. If our battleships can be protected by the use of steel plates, why not protect our shaft timbers from the deadly shot of the miner in the same manner?

Not knowing of any one using a device of this kind before me, I gave it the name of "armor plate."

As mining men, we are certainly under obligations to our neighbors and fellow workmen for any and all pointers, coming from whatsoever source, as the experience and experiments of others inure to our good. Consequently, I contribute this simple device and my experiments for the good of the readers of the MINING AND SCIENTIFIC PRESS.

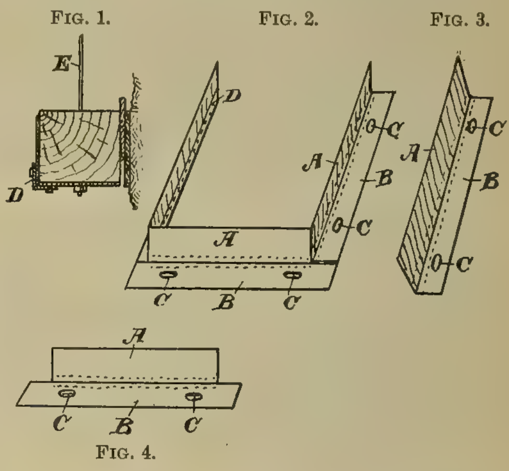


Fig. 1.—End view of timber, with side armor plate in place.

Fig. 2.—Sectional view, showing armor, end and side plates in position; also showing angle iron, with heads of rivets.

Fig. 3.—Side section of armor plate.

Fig. 4.—End section of armor plate.

A.—Inside plate, $\frac{1}{4}$ inch thick. B.—Bottom plate, $\frac{3}{8}$ inch thick. C.—Slotted or round hole for hanging rods. D.—Angle iron, showing heads of rivets. E.—Hanging rod, holding timber and armor plate.

Armor Plates for the Protection of Shaft Timbers Where Blasting in Shaft Sinking.

DIRECTIONS FOR CONSTRUCTION AND USE.—Have steel plates cut the proper width to fit the bottom and inside of wall plates, and the length of wall plate inside of end timbers, and fasten them together by means of angle iron and rivets, heads of rivets outside of plates, so that inner side will be smooth to fit timbers. In putting plates together, have bottom plate extend through or under side plate, or, better, setting edgewise on top of bottom plate. It will receive a harder shot with less damage in this way. Use good weight angle iron, and put rivets about 4 inches apart. The bottom plates (B) are constructed with round or slotted holes to receive hanging rods. The slotted holes are perforated, as it will allow for any variation that might occur in boring the holes in timbers for hanging rods, and cause no delay in placing armor plates in position.

The end plates are constructed with the bottom plate (B) the full width of the shaft timbers when together. The inside plate is cut proper length to fit between the wall plates and put together with angle iron, the same as side plates, cutting angle iron the length of plate (A) only. The side plates are quite heavy, but can be raised or lowered by use of cable, or, when timbering platforms are in place, they can be handled quite easily by hand. We found they could be handled much quicker and easier than the old plank of bulkheads, and when we removed the plates we found our timbers in as nice condition as when put in, and we worked for months at a time without injuring a timber, and no loss of time or material retimbering. In sinking a three-compartment shaft 750 feet we wore out two sets of these armor plates, which cost us less than $100 in San Francisco. Any foundry can construct to order, or the same can be built at any mine where a power drill is in use.

Some Questions Answered.

The following are of the class usually answered in "Concentrates," but seem to require the publication of the question as well as the answer:

A man here has a water tunnel and a pipe line on a piece of mineral land, but has made no filings or record of any claim of rights. A second individual has found mineral near the water tunnel and has made a regular mining location and claim of 1500x600 feet, including tunnel and portion of pipe line, and has also done assessment work and recorded the same. Can the second party claim the water in said tunnel for mining and milling purposes? The water at present is being piped to the town and sold to consumers.
Cherry Creek, Nev.

On this subject "Lindley on Mines" says: "Mining locations made upon the public lands must be made subject to any easements therefor lawfully acquired and subsisting, and held for the purposes of conducting water over them. * * * * The miner who selects a piece of ground must take it as he finds it, subject to prior rights which have an equal equity."

It is to be said, in general, that any land to which any claim or right of others has legally attached does not come within the definition of "public land," and only public mineral land can be entered under the federal mining law.

I am looking for a stone called magnet stone—not lodestone; comes 1 inch thick; varies from 10x10 to 10x20 in size; very fine, porous, light in weight and dark steel-gray in color. I have been referred to you by several in Nevada, California, Colorado and Utah. I think it was mined in Nevada.
Philadelphia, Pa.

The inquirer has probably been reading the Sunday newspapers and illustrated "science" articles therein. The gentleman from Leisenring, Pa., who wants further information regarding the "mountain of quartz in San Bernardino county, Cal., which was recently entirely transformed into a mountain of gold by a great electric discharge," seems equally unfortunate in his selection of "scientific" reading.

Will you please consider the following problem in concentration of silver-lead ores? The ore is galena carrying gray copper, which in turn seems to carry the silver. The gangue matter is heavy spar, or barytes. Analysis shows the ore to run: Silver, 19 ounces; lead, 13.7%; silica, 43.9; $BaSO_4$, 23.9. In order to effect separation from the barytes we have found it necessary to grind to 40 mesh. By doing this and concentrating at the rate of 4.25 to 1 we save 99% of the lead, but our tailings assay 17.50 ounces silver. The gray copper and the barytes seem to pass off together. Our neighbors, who have quartz instead of barytes, have the same difficulty in attempting to save the silver.
Colorado Springs, Colo.

Such ore as this would probably come under the head of an ore subject to a double treatment. In ores of that character the silver that is not susceptible to concentration is very often susceptible to cyaniding, and by cyaniding the crude ore first and then concentrating the tailings have been produced good results. It is almost entirely a question of the ore, and one can only tell by continuous experience. Of course, the ore would have to be cyanided by the continuous process.

This whole subject was thoroughly treated in a series of special articles written for this paper that appeared in the issues of March 3, 10 and 17, 1900.

A man runs a tunnel into a mountain, presumably for water, and at the distance of 200 feet strikes quartz and locates a mining claim. Can he use this tunnel, which he made previous to the location of said claim, for the $500 of development necessary to secure a patent?
Wallace, Idaho.

Only work or development done after the date of location of a mining claim can be legally credited or applied to the amount of work necessary to be shown to entitle the locator to patent.

1. How many strictly silver-producing mines do you know of in the United States that are being worked at a profit under the low price of silver?
2. Do you know of any new silver district that has been opened up since 1893, or for some time before that?
3. Is there any increase in the production of silver since that time, and, if so, does it keep pace with the increased demand?
4. Do the copper mines of Butte, Mont., and the lead mines of the Cœur d'Alenes produce as much silver per ton of ore at depth as they did at surface?
5. Would the opening of China increase the demand for silver to any great extent?
6. With silver as a commodity and no new district having opened, how long do you think it would stay at the present low price?
7. Would you consider it a good investment to buy silver property now, at a reasonable price, that would pay a fair profit with silver at $1 per ounce?

Phillipsburg, Mont.

The above are interesting questions that are not all susceptible of accurate reply.

Which is the most efficient, stamps weighing 1050 pounds each and dropping 9 inches ninety per minute, or stamps of same weight dropping 7 inches 110 per minute. We run all our material through a breaker which reduces it to 1 inch, and aim to have about 1 inch of the same under the stamps.
Dutch Flat, Cal.

We have now in type an article covering this and similar questions regarding stamp milling of gold ores, that we expect to publish about the first issue in December. It is the most elaborate discussion of stamp milling of gold ores that has appeared in five years.

I am trying to utilize the exhaust of a power drill, so that I might get rid of the drillings made by the drill, either by suction or other ways, without the use of water, so that these drillings would not be constantly pounded up and choke the hole up; but the face of the drill might be against the rock to be drilled continually. Certainly there is a great deal of valuable power going to waste in the exhaust of a drill that should be utilized in some such way. It would make a remarkable difference in the capacity of a power drill and the power used.
Aspen, Colo.

It is universally conceded that these machines are wasteful of power; but this is accepted as an unpleasant, yet unavoidable, necessity. Two conditions will always have precedence over all others in the matter of machine drills: They must be powerful, i. e., do much work under reduced size, and they must be simple. Of course, if they could at the same time be of economical use, it would be a desirable and important feature. Tandem compound cylinders, with successive expansion of the air, would furnish a solution in this direction, but would make the machine heavy and intricate. Early cut-off in a single cylinder would reduce the force of the blow. The only promising attempt made, so far as we know, consisted in reheating the air before its admission into the machine by inserting a row of oil burners between the air hose and the valve chest. The pressure would then remain the same, but the volume could be increased from 40% to 50% at a very slight cost. This, however, was apparently found impracticable, as this process never progressed beyond the experimental stage. As to making the escaping air do some useful work of any kind, it necessarily amounts, in whatever shape it is done, to throttling the exhaust port, and creating a back pressure detrimental to the power of the blow. In a familiar way it would be, to some degree, equivalent to keeping an obstruction very close to the exhaust opening, which, of course, would not be calculated to improve the work of the machine. Our correspondent is right in condemning the uneconomical escape of a cylinder full of air at a high pressure, at each blow of the bit, but it is believed that in reducing the power absorbed by the machine he would also diminish its effectiveness.

Some Recent Additions to the Collection of the California State Mining Bureau.

Rich cobalt and copper ore, with gold and silver, the higher gold values appearing to accompany the cobalt, which occurs as linnæite, from Dixie creek, Grant county, Or.; J. F. Bachelder.

Gold quartz with free gold, from Lappin mine, Deadwood district, Trinity county, Cal.; M. A. Brady.

Gold quartz, from Chloride–Bailey mine, Canyon Creek district, Trinity county, Cal.; H. Wilson.

A very remarkable specimen of crystallized lead, from the Richmond Con. Smelting Works, Eureka, Nev.; Mrs. E. Probert.

Rich tin ores and tasmanite, from the celebrated Mount Bischoff mines, Tasmania; Thos. Stephens.

A number of specimens of copper and lead ores, gold quartz, etc., from the Tasmanian Museum, Hobart, Tasmania.

Emerald crystals, from Coffee Creek district, Trinity county, Cal.; J. Carr.

Auriferous talc and serpentine with free gold, from Blue Lead mine, Trinity county, Cal.

Auriferous quartz porphyry and granodiorite, from Coffee Creek district, Trinity county, Cal.

Rich gold quartz, from Delta, Dog Creek district, Shasta county, Cal.; Wm. Hveem.

Cuprite, fine specimen, from the Ludwig mine, Yerrington, Nev.; J. B. Somers.

Copper ores, several varieties, from Copper Hill mines, Rinconada, N. M.; Ph. Rearden, Supt.

Tin ores from six different mines, cerrusite, axinite, crocoite, chrysolite, etc., from Tasmania; Tasmanian Museum.

Molybdenite and rich copper ore, from the Mariposa mine, Sinaloa, Mexico; Gus Peterson.

Copper ores from seven claims in Waldo district, Josephine county, Or.; J. Waln Morgan Draper, M. E.

Hubnerite, from Osceola, White Pine county, Nev.; Gaby, Buntin & Doyle.

Cinnabar, from Saucillo, Chihuahua, Mexico; Wm. B. Gester.

Also, an interesting series of rocks, illustrating the gradual changes and alterations of rocks from crystalline to schistose and slaty, and numerous other specimens of quartz, ores, etc.

There has just been placed on exhibition a very handsome series of slabs of aragonite, popularly known as onyx, from Kesseler's quarry, San Luis Obispo county, Cal. These are all transparencies, or natural pictures in the rock, and well worthy of inspection.
Henry S. Durden, Curator.

Pyritic Smelting in the Black Hills.*

Pyritic smelting, so-called, as practiced in the Black Hills is pyritic smelting only in the sense that Dr. John Percy uses the expression in his "Metallurgy of Silver," where he describes a process for smelting dry silver ores in connection with iron pyrites, to form a regulus.

The ores treated by this process in the Black Hills are very siliceous, averaging about 74% of silica, from 10% to 20% of oxide of iron, 4% or 5% of alumina and from 2% to 4% of lime.

In 1889, while dean of the South Dakota School of Mines, I took up the question of their smelting. There were neither copper nor lead ores in the Hills, hence pyrite and pyrrhotite, of which there are large deposits, were employed to form a regulus. This mixture of pyrite and pyrrhotite, besides being absolutely barren of gold and silver, carried an average of 30% of silica. The only basic material available as a flux for the great excess of silica in the ores and in the flux was a dolomitic limestone. Moreover, the local coke gave 24% of ash, 60% of which was silica—as unpromising a set of conditions as can well be imagined.

We had before us the examples of W. Lawrence Austin of this Institute, who had experimented at Toston, Montana, and of Dr. Bartlett, now of Canyon City, Colorado.

The whole literature of the subject was studied, and the situation at Kongsberg, Norway, seemed to be nearest our problem; but at all places where pyritic smelting was followed one factor stood out prominently: the slags were always very siliceous, carrying about 50% of silica. We could not reduce them to any very definite formulæ. They did not resemble any of the typical lead smelter slags, nor did they always hit the oxygen ratio of any definite or recognized silicate. The best slags for the process were apparently those which, as Kerl expresses it in his Metallhuttenkunde, approached a bisilicate ratio.

The slags which we found best for our material approached a bisilicate ratio, if alumina was figured as an acid (as is done at Mansfield), but more nearly the sesqui-silicate if alumina was considered as a base.

Table I gives the widest variations of slags made during my administration. I have also calculated the oxygen ratio.

TABLE I.—ANALYSES OF DEADWOOD AND DELAWARE SLAGS.

DATE.	SiO_2.	FeO.	Al_2O_3.	CaO.	MgO.	Oxygen in acid.	Oxygen in base.	Silicate Degree. RO.	Silicate Degree. SiO_2.
USUAL SLAGS MADE WITH DOLOMITIC LIMESTONE.									
Jan. 4, 1898	50.6	16.3	2.3	18.3	11.9	1.84	1	1.09	2
Jan. 29, 1898	47.5	16.8	4.9	18.7	11.8	1.57	1	1.27	2
Feb. 17, 1898	45.7	17.6	6.1	17.9	10.1	1.53	1	1.31	2
Dec. 5, 1898	49.1	15.0	4.2	18.47	10.6	1.76	1	1.14	2
July 14, 1899	48.0	13.0	5.4	20.0	12.9	1.57	1	1.27	2
Sept. 9, 1895	49.0	11.11	5.86	22.6	12.04	1.58	1	1.26	2
April 23, 1896	47.5	9.64	7.00	22.6	9.10	1.63	1	1.23	2
EXPERIMENTAL SLAGS MADE WITH PURE LIMESTONE.									
July 24, 1894	51.6	19.50	5.83	17.1	3.2	2.08	1	0.96	2
July 31, 1894	48.1	26.91	9.10	11.4	1.9	1.79	1	1.11	2

In Table I the slags given under date of July, 1894, were made in an experiment with pure limestone. They were not so satisfactory as those made with dolomite. Their oxygen ratio probably gives the real reason.

It was seen very early in our experiments that iron for flux was out of the question, and that, save the little that the ores carried, we must rely upon lime and magnesia as bases. I was acquainted with the Mansfield slags, in which the iron sometimes falls as low as 4%, while the alumina may reach 15%.

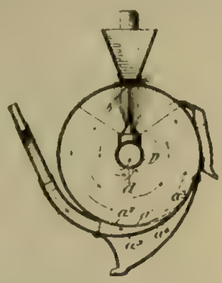
(TO BE CONTINUED.)

Mining and Metallurgical Patents.

Patents Issued November 6, 1900.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

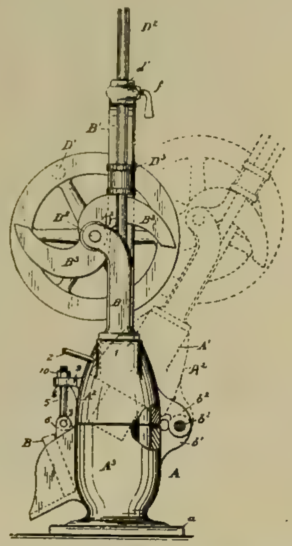
ORE CONCENTRATOR.—No. 661,086; A. H. Stebbins, Little Rock, Ark.



Combination of outer cylindrical drum, feed chute leading into drum in upper portion thereof, exhaust cylinder having opening through wall and extending axially length of drum, exhaust pipe connected with exhaust cylinder, air inlet extending through length of drum, arranged substantially tangential thereto, discharge opening in wall of drum over which incoming blast is directed, and concentrate box below drum.

◆

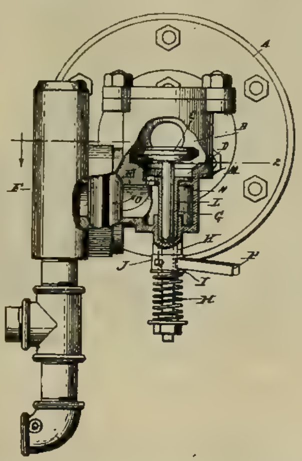
ORE STAMP MILL.—No. 661,144; M. H. Hamm, Petaluma, and H. R. Taylor, Oakland, Cal., assignors to J. Taylor & Co., San Francisco, Cal.



In ore stamp mill, combination with mortar comprising upper and lower section, hinged connection therebetween, of stamp working within mortar, standards secured to and projecting from upper mortar section, stamp stem extending through opening in upper mortar section, shaft mounted in bearings on standards, means operated by shaft for reciprocating stamp and device for locking stamp in raised position, mortar being provided with ore feed.

◆

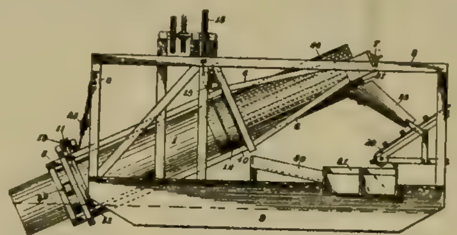
SPEED REGULATOR FOR GAS ENGINES.—No. 661,181; J. W. Lambert, Anderson, Ind.



In combination with gas engine, an igniting chamber connected to working cylinder thereof, gas supply conduit connected with chamber, main valve seated over opening therebetween, provided with stem extending through wall of supply conduit, an apertured auxiliary valve seat between main valve seat and supply passage, auxiliary disk valve seated against face adjacent to main valve provided with aperture, sleeve connected to disk valve surrounding main valve stem extending out through wall of gas passage; device for holding disk valve against seat, governor mechanism connected to projecting end of sleeve adapted to rotate same independently of main valve stem; means for intermittently operating main valve and its stem independently of auxiliary valve and its governor mechanism.

◆

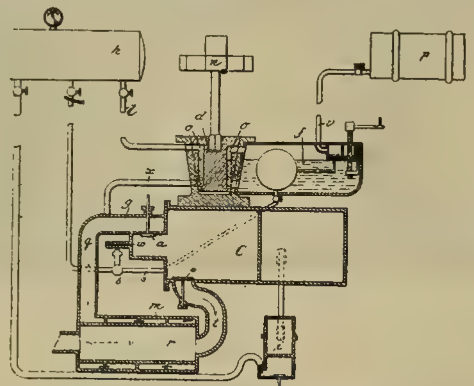
SUBAQUEOUS DREDGER.—No. 661,193; W. W. Priestly, Smartsville, Cal.



In dredging apparatus, main revoluble barrel set in inclined position having helical passage therein, inclosing frame 5 around barrel, means to prevent longitudinal movement of barrel therein, sustaining roller 19 mounted on frame and lateral bearing rollers 39 at its sides.

◆

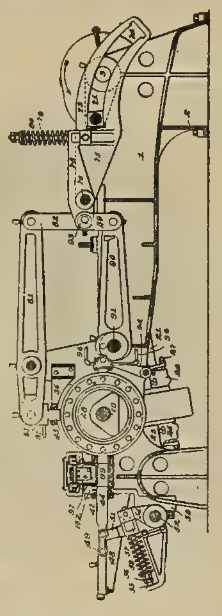
PETROLEUM MOTOR.—No. 661,235; L. Charon & F. Manaut, Paris, France.



In combination, cylinder and piston, vaporizer and storage chamber connected therewith, distribution valve for controlling flow of petroleum to vaporizer, gas valve controlling flow of explosive mixture to engine, means whereby in normal action of engine gas valve is held open during suction stroke and portion of compressing stroke, means whereby on excessive speed of engine distribution and gas valves are maintained closed, and means for preventing vacuum in cylinder during closure.

◆

MACHINE FOR FORMING PULVERIZED MATERIAL INTO BRIQUETTES.—No. 661,238; T. A. Edison, Llewellyn Park, N. J.



Machine for forming briquets of pulverized material, combination of mold, plunger co-operating therewith, rock shaft, an arm carried by rock shaft connected with plunger, main driving shaft, lever, cam on main shaft for operating lever, second arm carried by rock shaft, and connections between arm and lever.

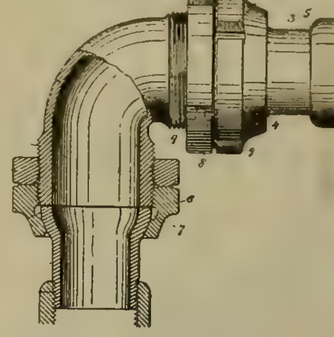
◆

PROCESS OF EXTRACTING PRECIOUS METALS FROM THEIR ORES.—No. 661,074; H. J. Phillips, London, England.

For extracting precious metal from their ores, which consists in pulverizing ores, subjecting same in closed vessel under heat to action of chloride of sulphur, amount of chloride of sulphur so employed being proportioned to amount of gold or other precious metals in ore and which it is desired to recover, raising temperature of mixed ore and chloride of sulphur until latter is dissociated, and chlorides of precious metals thereby formed, and recovering precious metals from chloride "in any well known manner."

◆

METALLIC FLEXIBLE JOINT.—No. 661,377; J. C. Martin, San Francisco, Cal.



Metallic flexible joint comprising curved pipe provided with threads on each end, nipple having enlarged end abutting one of the ends, enlarged end formed with smooth exterior spherical surface and socket ring fitting and forming joint with enlarged portion of nipple and provided with internal thread adapted to engage with thread on pipe and having recess or countercored internal enlargement between threads and spherical joint surface and lock nut adapted to engage with threaded socket to secure it in position and substantially similar nipple, threaded socket and lock nut on other end of curved pipe.

Tempering Drills.*

I find that in order to make a good drill it requires close attention from start to finish.

I sharpened thirty-seven drills for a contest awhile ago, and this is the way I did it: I worked with a low heat, and at the very last I pounded the face of the drill over and over, first on one side and then on the other side, until it was black or showed no heat; then put it in the fire just long enough for it to show a slight color, and then pounded it in the same manner as before, and so on, several times.

At the time I did this last work upon it, I never struck it once on the edge; if it was too large, I ground it off; then, before chilling, I put a nice finish on the drill.

In hardening I heated the drill to a nice cherry-red, taking a long heat of about 3 inches. In taking this heat I always kept the drill moving in the fire, and towards the last had scarcely any blast on.

Just before taking it out of the fire I shut off the blast entirely, and then I plunged it in water and left it until thoroughly cold. I then polished it bright.

To temper I gave several old drills a long heat, and laid my drill on top of these, letting it project over about 2 inches, taking about fifteen minutes to temper, drawing to a straw or nearly a copper, and laid it down to cool without putting it in the water.

I treated all the drills in this way and not one of them broke, although they were used in Gunnison granite with an eight-pound hammer. A miner who saw them used stated that he had seen drilling contests in Leadville, Denver and Butte, but never saw chisel-shaped bits stand the racket as these did.

---

* John Raab, Ouray, Colo., in Crescent Anvil.

Cost of Coal.

The price of coal at the pit's mouth varies a good deal in the different centers of production. The lowest point appears to have been touched in British India, viz., 92 cents per ton, while the dearest coal is met with in the Cape Colony, where the pit's-mouth price is $3.56 per ton. The corresponding price in Natal is much less, viz., $2.50 per ton. Coal can be obtained at the pit's mouth in New Zealand for $2.50 per ton; in Tasmania for $2 per ton; in Victoria for $1.79 per ton, and in New South Wales for $1.39 per ton. Transvaal coal costs $1.91 per ton at the pit's mouth. The United States ranks next to British India as a cheap coal-producing quarter, the average price at American pit's mouths being $1.15 per ton, though on the Pacific coast, and in California especially, it runs as high as $7 per ton. As regards European countries, the cheapest coal would appear to be available in Spain, where the pit's-mouth price is only $1.52 per ton; Austria comes next with $1.53 per ton; Great Britain third with $1.62 per ton; Russia fourth with $1.68 per ton, and Germany fifth with $1.84 per ton. The average pit's-mouth price in Belgium is $2.05 per ton. France figures to still less advantage with an average of $2.17 per ton.

The Smidth Ballmill.

On this page appear three illustrations of the Smidth ballmill, originally designed and used for reducing materials from a lump state to the market fineness in one operation. This involved the use of outside screens which bolted the material to the required fineness, and in the case of material like Portland cement clinker, where extreme fineness, such as 95% through 10,000 meshes per square inch, was demanded, the output of the ballmill was relatively small, though its low horse power, slow speed and slight cost of repairs made it more economical than buhr stones or the then popular ring and pendulous-head type of machine. But immediately after the invention of the tubemill, the ballmill was made use of for preliminary crushing only, its product being passed to the tubemill for fine grinding or pulverization, this system demonstrating further reduction in the cost of grinding.

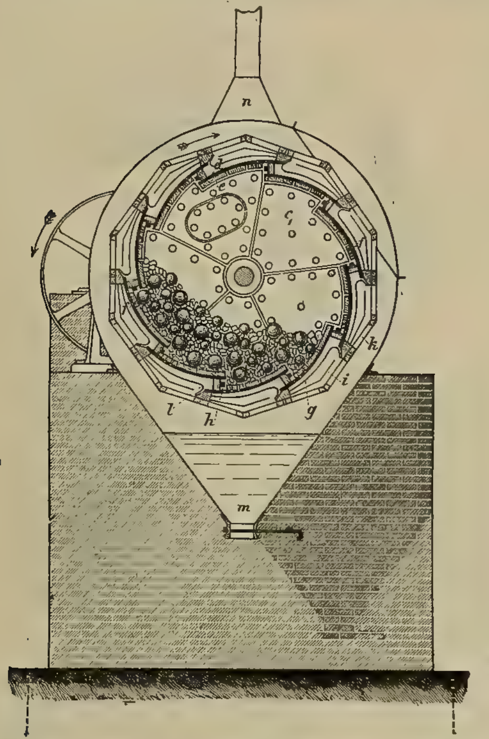

Fig. 1.—Type A, Showing Grinding Plate and Sieve Arrangement.

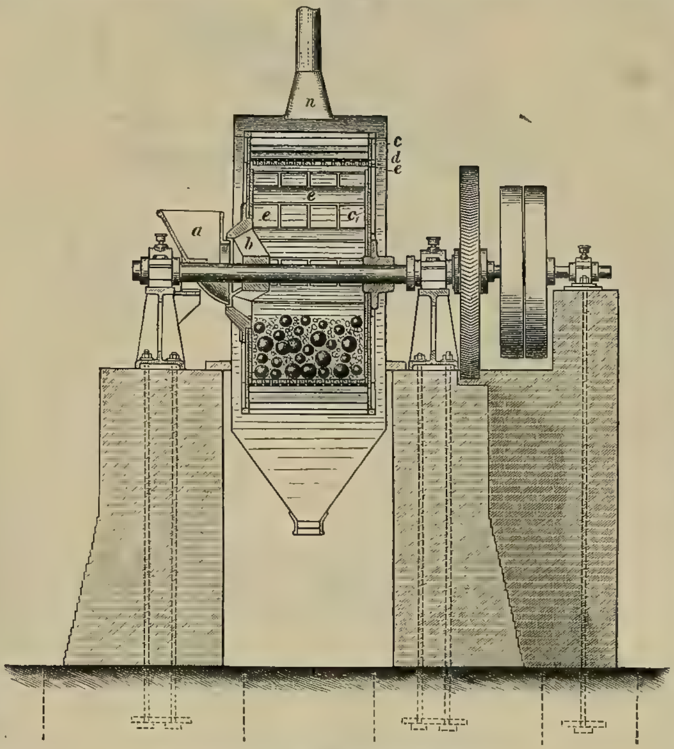

Fig. 2.—Type A, Showing Through Shaft.

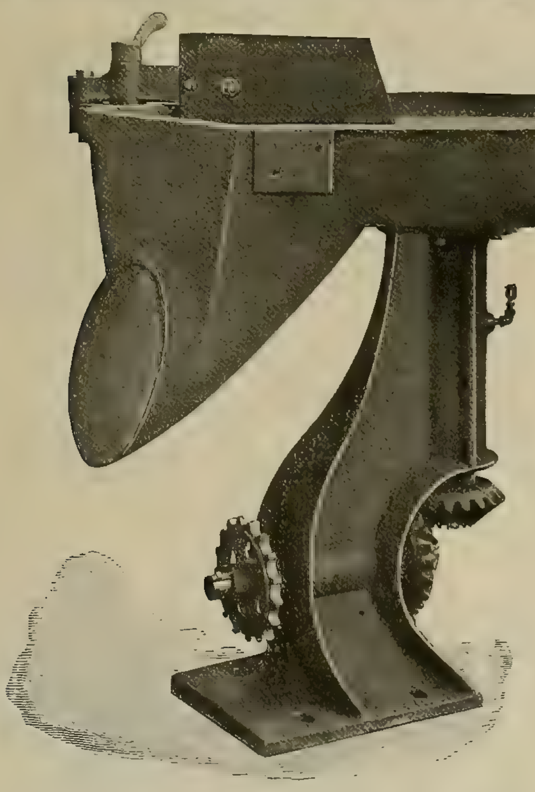

Fig. 4.—Smidth Automatic Ballmill Feeder.

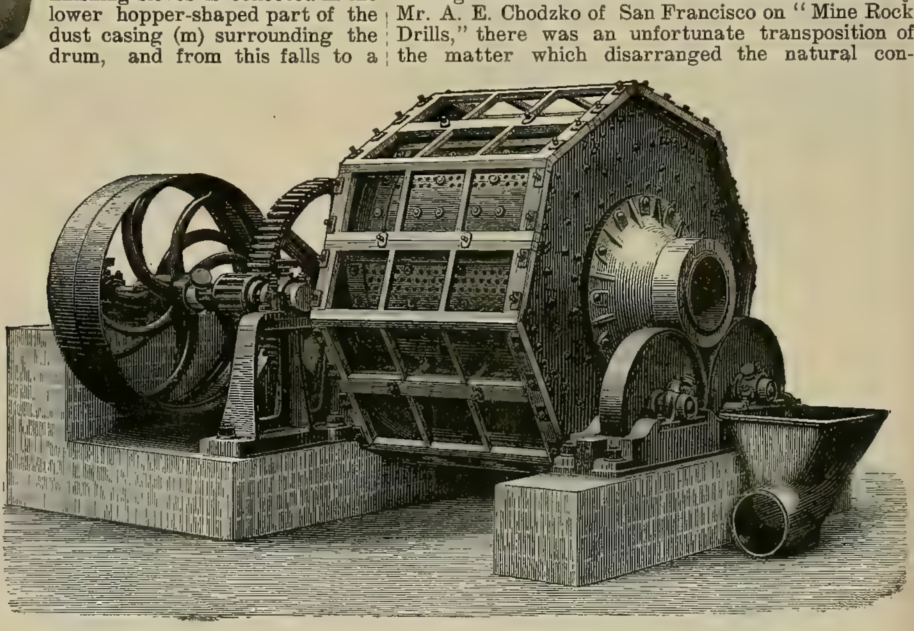

Fig. 3.—Smidth Ballmill, Type B, Showing Roller Bearing as Used on Type C.

The Smidth ballmill is stated by its makers to be the result of practical experience in using the original idea, the objectionable features of the earlier design having been eliminated and the maximum of convenience for access and repair developed and arranged. To meet the demand for several forms of the ballmill, the makers have designed types classified as A, B and C.

Figs. 1 and 2 show the internal arrangement of the type A ballmill. This machine has a through-shaft with journals running in bearings at both ends, and consists of a drum with two end plates (c), between which the curved drum plates (d) are fixed. These plates do not form a cylinder, but one end of each is set a few inches towards the center, forming steps. The balls and materials tumble over these steps, when the drum revolves, the pounding action of the balls being designed to be increased thereby, the steps allowing residue from sieve to be caught and reenter drum. The curved drum plates are protected on the inside by thick steel plates (e) which are divided into several sections, so that each section can be separately renewed. The lining plates are fixed by means of bolts. The end plates (c) are also lined with thick plates (c1).

The grinding plates have rows of perforations (f) through which the crushed material constantly falls on slotted steel screen plates (g). Whatever is fine enough to pass these screen plates falls on the inner sieves (l), coarse and strong; that which passes through these falls on the finishing sieves (k). The material passing through the finishing sieves is collected in the lower hopper-shaped part of the dust casing (m) surrounding the drum, and from this falls to a conveyor or elevator, or may be dropped direct into the containers. The outlet of the dust casing is provided with a slide gate.

The residue from the sieves, coarse and fine, is carried up with the mill, until it falls through large holes in the curved part (l) of slotted steel screen-plates and together with residue from these falls into the drum again through the steps. In one of the end plates a man-hole is fitted and in the dust casing a door corresponding to the man-hole, giving access to the interior of the mill. The dust casing is made in three parts, a small section being easily removable for brushing the sieves. The top half may be removed for repair of the drum.

Fig. 3 shows the type B machine, the same as A, except that the shaft, instead of going through the feed-hopper, is stopped short inside the drum and there fixed in a spider, the external part of which runs on a roller bearing. By means of this arrangement lumps up to 10 inches each way can be fed into the mill, and the feed opening itself at the same time is reduced in diameter, which allows a heavier charge of balls to be used.

Fig. 4 shows the automatic ballmill feeder for the ballmill, which is attached to and operated from it. About 90% of these ballmills in operation are being fed with these automatic feeders. The apparatus illustrated is made and furnished by F. L. Smidth & Co., 66 Maiden Lane, New York City.

The Power Behind Nature.

Dr. Carpenter once wrote an essay on "The Power Behind Nature," in which he compared the production of the various natural phenomena of the external world to the working of the machinery in a large and well equipped factory. In this factory hundreds of wheels are kept in operation in one immense room by a system of bands, which connect them all with a common source of motion. That common source is simply a revolving beam. But there is nothing in the room that could turn it. Evidently, it must be connected with something outside that is invisible inside the room. Going outside, one finds what, perhaps, strikes him as an easy solution of the problem. The beam is turned by a huge wheel, which, in its turn, is moved by a constant stream of water. But what is that which feeds the unfailing sources of this stream? Well, the whole process—as far, at least, as science can follow it—is traced at last to the sun, which lifts the water, in the form of vapor, from the sea, and returns it as rain, or hail or snow to the land. There, indeed, is the power outside the factory that turns the wheels within. If the motive power were steam, instead of running water, this answer would still hold good. The power, the force or the energy is in either case derived from the sun. But the sun is part of a system, and has had a beginning in time. Speculative astronomy attempts to account for its origin by the theory known as the nebular hypothesis. This theory, however, points to no absolute beginning. To explain the making of the solar system it assumes conditions that are still left unexplained. The mind of man, after science has said its last word, is left to look for "the power behind nature."

In the issue of the 10th inst., in the fifth and concluding installment of the admirable article by Mr. A. E. Chodzko of San Francisco on "Mine Rock Drills," there was an unfortunate transposition of the matter which disarranged the natural continuity of the article as written. That portion of it styled "Appendix" should have followed, instead of preceding, the reference to the types of machine drills mentioned therein.

The richest countries in the world are where mining is prosecuted most vigorously. The poorest countries are those where there is no mining. The richest men in the world are and always have been great miners, from King Solomon down to the Rothschilds and Rockefeller, who are now largely interested in mining gold, silver, copper, lead and nickel.

MINING SUMMARY.

ALASKA.

(Special Correspondence).—Another big storm has struck us, resulting in much damage to shipping and property. Eight thousand people will winter here, and much suffering may ensue, as coal is scarce and price of same is high, having been put up to $100 per ton to-day. From present outlook, a rush will be made next spring to the Kougarok country. The arrest and return to the United States of Receiver McKenzie has had an encouraging effect upon everyone here; confidence has been somewhat restored and prospects for the future look brighter.

Nome, Oct. 22.

It is expected by next summer that through telegraphic service will be in operation between the United States and Nome, via Dawson and St. Michaels.

A semi-official statement from Nome bankers gives the gold output of that district as $5,000,000 for the past season, as compared with $2,000,000 for 1899. Most of the gold was from Anvil creek.

The Nome Gold Digger states that fourteen quartz claims near Bluff City, Chenik district, have been sold to Pittsburg, Pa., men, for $500,000. It is said that mills and a cyanide plant will be put in next year. D. F. Clinton of Pittsburg, Pa., represents purchasers. C. W. Johnson, Supt. Heid & Sandstone property, near Taku, is prospecting the property with diamond drill; 180 feet of core has been taken out.

G. Skeavington of the Mellen M. Co., Juneau, says that it will be necessary to put in electric plant for power; the mine has closed down for the season.

Thirty-five stamps are dropping at the Nowell, near Seward City, and thirty men are working.

ARIZONA.

COCHISE COUNTY.

The Bisbee West Copper M. Co., Bisbee, will develop property near the Copper Queen.

The Copper Crown of Arizona M. Co., now developing property in the Dragoons, near the Black Diamond, have the Boxer and the Expansionist claims, giving them about 160 acres. The company are taking out ore from the Copper Chief, and have let a contract for a large working shaft.

Good ore has been struck on the 700-foot level of the Lake Superior & Western, Cochise. A new hoist will be put in, and a three-compartment shaft will be sunk.

A new plant is going in at the Pearce or Commonwealth mines, near Pearce, to replace the one recently burned.

The Copper Queen (copper), Bisbee, W. Douglas manager, is producing 500 tons of ore per day. Nearly 1000 men are employed.

GRAHAM COUNTY.

The Mexican–Arizona Copper Co., capital $500,000, is incorporated at Clifton.

MOJAVE COUNTY.

The Connor, near Chloride, has several men at work. Work is being pushed.

At the Gold Road mines, near Kingman, timbering of two shafts is completed and sinking is resumed.

A lapidary will be employed at the turquoise mines, near Mineral Park.

The Lone Star, Mineral Park, is producing good ore from the 150-foot level.

H. S. Mackay of Boston, Mass., who has bonded the C. O. D., near Kingman, will begin unwatering the mine on Dec. 1st. A new plant will probably be put in.

Men are at work on the Draper group (gold), 2 miles from Pyramid.

PIMA COUNTY.

The Duquesne M. & R. Co., at Washington Camp, will put in a new plant and railway; J. F. Tenor general agent.

The Helvetia Copper Co., 36 miles south of Tucson, has 150 men working. The output is 250 tons daily of 14% copper ore. General Manager R. N. Seagur, Supt. B. J. Close.

There are two 30-ton copper smelters in San Xavier district, 30 miles from Tucson.

Scott & Gaff are sinking a 500-foot compartment shaft in Silver Bell district, 40 miles west of Tucson.

PINAL COUNTY.

At the Mammoth gold mines, G. P. Blair manager, at Mammoth, near the San Pedro river, 52 miles from Tucson, the 70-stamp mill is running. They have also a good cyanide plant.

The Mohawk, an extension of the Mammoth, has a 30-stamp mill.

The Cornelia Copper Co., in Ajo district, near Florence, have machinery in place to sink the shaft, now down 300 feet, to the 1000-foot level. A 100-ton mill may be put in soon.

H. M. Finley of Muncie, Ind., will open up the Double Standard mines, Old Hat mining district.

YUMA COUNTY.

T. Drennan is putting his mill, near Parker, in shape to run.

CALIFORNIA.

AMADOR COUNTY.

The Democrat says the closing of work by the Standard Electric Co. has caused much surprise.

Supt. Derby of the Oneida, near Jackson, states that capacity of mill will be increased to fifty stamps by putting in a 75 H. P. electric motor. Water power now runs twenty-five stamps.

At the South Eureka the new hoisting plant is working successfully; sinking will be continued 200 feet deeper, making total of 2000 feet on the incline.

A good body of ore is opened up on the 400-foot level of the Mutual, near Sutter Creek.

Sinking on the Kirkwood, near Jackson, will resume as soon as the new engine is placed.

Sinking on the Peerless shaft, now down 500 feet, is in progress.

The new east shaft at the Kennedy is down 1700 feet and forty stamps are dropping.

A recent cleanup of 580 tons of ore from the second, third and fifth levels of the Lincoln gave the following: 227.75 ounces valued at $3813.49; 14.75 tons sulphurets valued at $859.52. Total net value, $4673.01.

A stamp mill has been put in on the Bellwether, near Jackson.

CALAVERAS COUNTY.

The Sunrise, at Railroad, is bonded to K. B. Weatherwax of Washington, D. C., for $8000, and $5000 of the amount is paid. A hoist will be put in and work started.

The old Finnegan, Carson Hill, is being worked by Fenton & Rolleri.

Work on the Lone Star, near West Point, is resumed and men are sinking the shaft.

The Vorlander, at Middle Bar, has resumed.

At the Gwin, near Mokelumne Hill, water power is being used instead of steam. Eighty stamps are dropping.

The shaft at the Tulloch–Magruder, Angels, will be sunk to 600-foot level. A new plant will be put in also.

At the Morning Star, Supt. Jennings, ore running $15 per ton is opened up.

EL DORADO COUNTY.

The El Dorado Republican states that the Tin Cup, El Dorado, is sold to Hayward & Lane for $15,000.

W. Crocker and C. A. Robert, operating the Lilly Emma (copper), near Pilot Hill, recently sent 180 pounds of ore from the mine to the State Mining Bureau at San Francisco for an exhibit.

Mr. Lake will resume hydraulic operations in Coarse Gold gulch, near Echo.

KERN COUNTY.

The Pacific Con. is down 1162 feet on 2, 32–22, 6 miles from McKittrick, and the well will be finished at that depth.

The Peerless No 6, on 31, 28–28, Bakersfield, is pumping 720 barrels every twenty-four hours.

The Lion of Arizona, at Sunset, is yielding 500 barrels per day.

The Yellow Aster M. Co. is getting foundations, etc., ready for the placing of the new 100-stamp mill. The contract for the latter was awarded the Union Iron Works of San Francisco on the 10th inst. The stamps are to be 850 pounds each.

The Sunset Czar Oil Co., on 19–10–23, Sunset district, produces forty barrels daily.

The Sunset King Oil Co. will begin drilling on 19–10–23.

LOS ANGELES COUNTY.

J. H. Alderson has a 25-barrel producer corner Toluca and Court streets, Los Angeles. The well was drilled 950 feet in one week.

MARIPOSA COUNTY.

The Virginia, Coulterville, has resumed. Supt. M. C. Randolph has twelve men working.

MONTEREY COUNTY.

F. J. Horswill has leased the Stacks canyon coal fields, 330 acres, to prospect for coal and develop, with an option to purchase at the end of the year for $300,000. The mine was formerly worked by the Pacific Improvement Co. The main tunnel has been cleaned out and exposes a 14-foot vertical vein.

NEVADA COUNTY.

The management of the old Banner, Nevada City, have decided to erect a new hoisting plant and a 20-stamp mill on the property.

New machinery is in place at the Nevada County, Grass Valley. The drain tunnel and shaft have been cleaned. Good ore, showing free gold, has been opened up.

A new air compressor and flywheel are being installed at the Champion–Columbia mine in Washington district.

The La Suerte G. M. Co. has levied an assessment of 2½ cents per share, delinquent Dec. 10.

At the Nevada County mine the shaft is cleaned out to the depth of 80 feet.

The Live Oak Con. G. M. Co. has levied an assessment of 5 cents per share, delinquent Dec. 3.

Ogden Bros., working the Federal Loan, near Willow Valley, recently shipped six tons of ore to the Selby Smelting Works, San Francisco, which returned $250 to the ton.

Five tons of ore from the Tilley, Grass Valley, returned $28.25 recently. New machinery will be put in and more men will be put on.

G. C. Sargeant has started a free library at his Quaker City gravel mine.

A large hoisting and pumping plant will be put in on the Washington, Nevada City, to replace the old plant, which has been shipped to San Francisco.

The new 2-stamp, triple-discharge mill for the Reward will soon be in place and running.

The Union Hill, Grass Valley, E. Creller Supt., is closed down. Over $80,000 has been spent in development.

PLACER COUNTY.

G. F. Stone, Supt. Herman, near Westville, has finished the work of placing a 10-stamp mill in the lower tunnel and work is in progress.

Colfax Sentinel: The main tunnel at the Eureka Con. drift mine, 12 miles above Forest Hill, is in over 4000 feet. The company owns 6½ miles of channel. F. Chappellet Jr. is Supt.

The Morning Star mine of Iowa Hill closed down this week, the pay channel being exhausted.

PLUMAS COUNTY.

T. Richards of San Francisco is getting things in shape at the Pioneer, on Bear creek, Quincy, for next season's run.

SAN BERNARDINO COUNTY.

The mill of the Parker Milling Co., 65 miles from The Needles, is progressing; men are working in the mine, 4 miles from the mill, getting out ore.

The owners of the Leoti, near Dale, will put in a cyanide plant.

SHASTA COUNTY.

The 20-stamp mill on the Gladstone, French Gulch, is being repaired, preparatory to starting. Nine hundred pounds of silver-plated mining plates were received recently.

The 10-stamp mill at the American is being put in shape to run.

Fox & Co., operating the Shafter, under lease from the Niagara M. Co., have a 3-foot vein of ore.

The mill on the Brunswick will soon start up.

A. di Nola of San Francisco has been confirmed as owner of the Clipper gold mine, in Backbone district, by a decision of Judge Sweeney.

F. P. Mitchell and T. Harrison have bonded the Cross Bow, near Redding, and will begin development work.

In the Iron Mountain fire a body of sulphide ore in Peck tunnel is still smoldering. Miners say it will not continue. Men are working.

SIERRA COUNTY.

The Orient G. P. M. Co. has levied a 30-cent assessment, delinquent Dec. 4.

W. W. York and sons are sinking on the Forest Queen, in Slug canyon, near Downieville.

SISKIYOU COUNTY.

(Special Correspondence).—The Black Bear mine has been sold to an Eastern company for $150,000. Mr. Daggett still retains the White Bear mine, upon which development work is being done.

The Yreka M. & M. Co. (Ball mine) have bought the air compressor and entire hoisting outfit, drills, pump, etc., of the Know Nothing mine. The compressor will be in operation at the Mountain Laurel mine by Jan. 1st.

There is considerable water from the last storms. The Ball Co.'s mill started Nov. 1st. The twenty stamps and five concentrators run smoothly. Mr. Pierpoint is mill foreman and has charge of the day shift and Mr. Hubbard the night shift. The mine is producing ore, and the output will be increased when Supt. Ball has the compressor installed.

The Salmon River Co. are working on their flume extension to the Meyers claim.

Rollin, Nov. 10.

Miners are at work on the Cherry Hill, on Cherry creek, getting out ore for winter crushing.

At the King Solomon, near Cecilville, it is said that only one pound of quicksilver to every 150 tons of ore treated is lost, the California average being about one pound of quicksilver to every thirty-five tons of ore.

TUOLUMNE COUNTY.

The development in the Golden West mine, situated on the Comstock Ranch, has reached such a stage as to, in the judgment of its directors, warrant the erection of a mill on the property. A carload of machinery is reported at the Sonora depot for the company.

The main building for the chlorination plant at the Shawmut, Jamestown, is completed. The foundation for the furnace has been laid and the ironwork is being put in place.

Seventy-five men are working at the Confidence, Jamestown.

More men will be put on at the High Point, near Stent. The drift on the 300-foot level is in 115 feet.

The 20-stamp mill at the Dutch mine, Quartz, is running. Forty men are employed and more will be put on as development progresses.

A 10-stamp mill is going up on the Hope, near Sonora, S. Ralston Supt.

It is stated that the Seminole, C. H. Thomas Supt., may resume, and that either electricity or compressed air will be used for power—probably the latter.

The new mill on the Poison Oak is nearly completed. The shaft is down 247 feet.

Work on the Mack shaft, Big Oak district, is discontinued until the mill is completed.

L. Barrone has men driving a crosscut tunnel on the Blue Bird extension, near Carters.

Assays of ore from the Blue Bird, recently made by the Selbys, gave $217.50 per ton. It is locally understood that a company may take over the Blue Bird.

Men are putting in an engine and boiler at the Crystalline, near Sonora.

The Confidence mill is running and many men are employed.

The Clio mill will be run day and night, instead of twelve hours daily, as now.

A circular from H. B. Stearns, covering the listing of Santa Ysabel G. M. stock, shows that the 130,000 shares issued, of the 150,000 shares of capital stock, have been admitted to the listed department. The present company succeeded the Santa Ysabel G. M. Co. of Wyoming, and the stockholders of the latter company were allowed to exchange their stock for stock in the new company on payment of $1 per share bonus. Twenty thousand shares are reserved in the treasury to provide funds if needed. In a letter of Nov. 7 the company states that all its outstanding notes have been paid and there is on hand a cash balance of $44,389. The balance sheet, dated Sept. 1, 1900, shows: Debit—Treasury stock, $20,000; mining property account, $73,997; expense account at mine, $607; expense account (general), $456; Haas Bros., $938; cash on hand, $91,547; total, $187,545. Credit—Capital stock, $150,000; notes payable, $36,000; mining sales account, $1545; total, $187,545.

TRINITY COUNTY.

The mill at the Ralston mine, near Dedrick, has been closed for the season. The mine is being operated.

COLORADO.

BOULDER COUNTY.

The new 30-ton concentrating mill at the Success, near Ward, W. B. Rundle manager, is running.

The Alaska tunnel is in 1500 feet.

The 40-stamp mill at the Boston is running steadily. A 20-stamp mill may be added.

The Pennsylvania mill at Sunnyside is closed down temporarily.

Plans are on foot for the consolidation of the Mogul tunnel, the Enterprise mine and the Bailey chlorination mill at Boulder. Should the deal go through, the new company will probably enlarge the mill and put in a surface motor tramway from the foot of Spence mountain to the mill.

CHAFFEE COUNTY.

Rea & Larson will resume operations on the Harrison group, in Fleming gulch, near Turret.

The new air compressor at the Queen City is running.

Galvin & Bradberry are drifting on the 80-foot level at the Spondulix, near Granite.

The Florence-Elmo M. Co., of Florence, capital $500,000, is incorporated to work property near Buena Vista, in St. Elmo district. C. R. Bernard, president and general manager. The company has three shifts of men on development work.

W. Wallace, Sr., has made a strike in the Red Rover tunnel, on South Clear Creek, near Winfield. He has opened a 7-foot body of copper-iron sulphides, carrying lead.

CLEAR CREEK COUNTY.

The upraise from the Knickerbocker

tunnel to connection with the Emerson shaft was successfully completed on the 3rd inst.

The Pioneer Co., Idaho Springs, is advertising for twenty-five miners. A new gasoline hoist is in and sinking will be pushed.

The Lemartine plant, Mgr. Hanchett, is now run by electricity from Georgetown. The hoist and compressor will be driven by air.

A new 80 H. P. boiler and compressor have been placed in Empress mill, Empire.

Five cords of ore from the Lombard-Polaris, near Yankee, returned twenty-five ounces gold; A. Ashbaugh owner.

The Toledo group, in East Argentine district, is bonded to Bonham & Son for $10,000. They will push work.

The Aududdel, near Idaho Springs, is sold to the John Owens M. & M. Co. for $75,000. The first payment of $15,000 is made. It is said that $200,000 will be spent in development by the new company.

Manager T. A. Irvin of the Garden, on Seaton hill, near Idaho Springs, states that he is drifting and opening new ground at 400 feet with good showing.

COSTELLA COUNTY.

The Trinchera Estate Co., owning a large portion of ground in Grayback district, has issued a series of mining regulations of its own. The locator is required after filling his location certificate at company's office, to do an assessment equivalent to the removal of 240 cubic feet of material. Within a year from date of location claimant is required to do $100 worth of work on his claim and also to file with company his written application for right to purchase claim, accompanied by $50 for payment of survey, and within sixty days after delivery of plat of survey to claimant he is required to pay for his claim at the rate of $10 per acre. Extensions of locations are reserved at pleasure of the company. Under these regulations a claim 1500x300 feet can be secured within a year at a cost of not to exceed $300.

DOLORES COUNTY.

G. Sanborn will resume work on the Puzzle Extension, Horse gulch, near Rico.

A body of zinc ore was recently opened up at the Silver Swan group, on Expectation mountain. The company is remodeling the Norton concentrator and will treat ores from the Silver Swan and Derby–Evans groups by Jan. 1; Nicholson Spelter Works, Iola, Kansas, lessees; T. Jones manager.

The Emma, Dunton district, R. Keller Supt., may double the capacity of the mill soon.

EAGLE COUNTY.

At the Wilkesbarre, Red Cliff, Supt. E. Dale, a new plant of machinery is in, and sinking of 4x5x9 double-compartment shaft goes on.

EL PASO COUNTY.

The new plant at the Elkton, costing $65,000, is running.

The Hartman, near Lanter City, 6 miles south of Woodland Park, has ten men at work. The shaft is down 100 feet, the bottom being in 17 inches of ore averaging one ounce to the ton.

FREMONT COUNTY.

(Special Correspondence).—The importance of Florence as an ore reduction center is increasing. The National and El Paso chlorination mills are operating on 150 and 100 tons per day, respectively, the Metallic (cyanide) running at the rate of about 300 tons per day. The chlorination plant of the Union Gold Extraction Co. is one of the most modern in existence and will be in operation before Jan. 1st. Its capacity is about 500 tons. A technical article descriptive of this property will be furnished the readers of this paper a little later. W. B. Milliken is manager and John E. Rothwell Supt.

The new cyanide plant of the Dorcas M., M. & D. Co. is rapidly nearing completion. Its capacity will be 125 to 150 tons and will be a custom mill. The ore will pass through a 10x20-inch Blake crusher, thence to $\frac{3}{16}$-inch mesh crushing rolls, thence through an automatic sampler, and is then conveyed by belt conveyors and distributed to ten V-shaped ore bins, having fifty-five tons capacity each. The material then passes through the cylindrical drier of the usual pattern, thence through screens and fine crushing rolls, which prepare it for the roaster, which is of the Holthoff–Wethey type. From the roaster the material is delivered to hoppers above the cyanide leaching vats, through which it is distributed, as required, to the vats. The vats are of steel, six in number, size 4x30 feet. They will be equipped with a pneumatic device for supplying air through the pulp. The precipitating room and bullion furnace are being well arranged on a floor below.

The usual vacuum tanks for drawing off the solution and the sump tanks to catch the exhaust are provided. On the lower floor is a row of eight Wilfley tables. The pulp passes from the vats through agitating tanks to the tables for concentration. To obviate the harmful effect of dust and also as a saving device, dust collectors are being put in on the crushing floor. After the roast a certain per cent of lime is added by means of Janin's automatic ore feeder. This company is made up largely of Boston and Cleveland people, J. M. Hower being manager and Louis Janin Supt.

The cyanide and chlorination plants handle Cripple Creek ores that run from $10 to $40 per ton—none that run below $10. As greater depth is gained in Cripple Creek mines, an increasing percentage of sulphur is observed. At present the ores may be said to average 2% sulphur or over, the silica running about 58% to 60%.

Some four or five months ago the mills made a reduction of treatment charges, and they now stand at $6 to $9 per ton delivered at the mills, the railroad rate being $1.50 to $3 per ton from Cripple Creek to the mills at Florence, Cyanide and Colorado City. The $6-dollar charge at the mills is on ore running $\frac{3}{4}$-ounce and below; the $9 rate being on ore running from 2 ounces up to 5 ounces gold.

The Rocky Mountain Smelter, being erected at Florence on plans prepared by Dr. R. F. Carpenter, will be a general smelter—that is, it will handle ores from all sections. The plant is built of structural steel, supported by heavy retaining walls of masonry, and includes two 36x180-inch furnaces, with two Connellsville blowers and two engines and three boilers. By Jan. 1, or sooner, this plant will doubtless take its place as one of the potent factors in the field of applied metallurgy.

The old Beam mill, now in the hands of the Florence M. & R. Co., is being changed and repaired with the idea of using the Beam roasting furnaces and applying what is known as the continuous system of cyanide treatment, with some features of amalgamation and concentration.

Manager John Jacobs of the El Paso Reduction Works states that the ore handled by that plant, amounting to 3000 tons per month, will average $25 per ton.

A feature of the National is the concentration of the refuse after chlorination by ten double-decked tables, by which, Manager J. R. McDonald states, a saving of 40% of the values left in tailings after chlorinating, is made.

All the Florence plants are equipped to use crude petroleum as fuel for the roasters, though they are also equipped to use coal. The consumption of this grade of oil product keeps up to the limit of production most of the time. When coal is used, the better grade is obtained, as the operators say they do not find much economy in using the cheap grade of slack.

The reduction works at Florence, Cyanide, Colorado City, Victor and Cripple Creek, including those nearing completion, will have a capacity of nearly 3000 tons of ore per day, or 90,000 tons per month, which is a greater tonnage than the district ever has produced; and it must be conceded that the Denver and Pueblo smelters will continue to get a considerable share of the district's output. But this abundance of reduction facilities must be regarded as favorable to the stimulation of ore production. The transportation facilities for reaching the reduction works with district ores are reaching a point of excellence hitherto unequaled.

Florence, Nov. 9. WASCOTT.

GILPIN COUNTY.

Shipments of ore from Central City for October were 344 cars, or 6365 tons.

The new hoister for the Kansas-Burroughs is running.

A 6 H. P. gasoline engine is to be put in on 1100-foot level of the Grand Army mine, Gunnell G. M. & M. Co. Sinking will be continued.

Jenkins, Lightbourn & Co., operating the old Gold Dirt at Perigo, near Gilpin, will run the Peterson & Daisy 15-stamp, slow-drop mills during the winter, requiring a daily output of thirty tons ore.

The Wizard M. Co. of Boulder are running a 350-foot crosscut tunnel into War Eagle hill, Central City.

Manager McCann of the Phœnix–Burroughs has the new 125 H. P. double-engine hoister in place, and sinking will be continued to 1165-foot level. October output of the Kansas–Burroughs Con. M. Co., operating the Phœnix–Burroughs, was 2449 tons ore.

The Peterson mill building is remodeled. New ore bins and a tailings house have been put in and a dam across the creek is finished.

The Gettysburg shaft, now down 185 feet, will be sunk to the 200-foot level. Three eight-hour shifts are working.

The Register-Call says that there are more miners at work on day's pay in Gilpin county than ever before in the history of the camp.

At the Clark-Gardner, on Quartz hill, near Central City, Manager J. W. Bostwick has day and night shifts drifting, etc. A 50-ton lot of ore will be shipped to Idaho Springs to be treated by concentration. At the Jones, near Nevadaville, work is in progress on the fifth and sixth levels. Ore is being treated at the Randolph mill. Supt. J. Hooper of the Gold Collar, in Prosser gulch, will resume sinking shaft, now down 660 feet, upon completion of a drift to hold water which has rushed in in last 200 feet of sinking. Shaft will be sunk 100 feet deeper. A new coal building is going up.

About twenty-five leasers are employed at the Bonanza tunnel property in Chase gulch, all on tribute system. Enough ore is being taken out to make daily shipments of twenty tons to Blackhawk mills with fairly good returns.

The Colorado-Ontario G. M. Co. has day and night shifts sinking shaft, now down 500 feet, on the O'Neil, in Gregory district; forty-eight men are employed. Supt. Loth of the East Boston & Gilpin G. M. Co., operating the East Boston, Gregory district, is shipping ore to Blackhawk. Supt. Harris reports a 10-inch streak of iron ore in shaft at the National, carrying values estimated at $60 per ton. Shaft is down 500 feet.

During the first week of November shipments of smelting and crude ores, mill tailings and concentrates from Blackhawk to outside points were ninety-six cars, or 1776 tons.

The Justice, in Lake district, Central City, will be operated by the New Haven & Denver Con. M. Co. Extensive developments are contemplated. L. Jones of Russell gulch will be underground foreman. The Hillsdale M. Co. has taken a three-year lease and bond on the Hamlet and Number One properties, on German hill, near Central City. A new shaft building has been erected on Number One, and shaft now down 70 feet will be sunk to 160-foot level to cut Hamlet vein. Nicolls Bros. are in charge.

GUNNISON COUNTY.

The work in progress on the big Reynolds group at Pitkin is nearly completed. The surface buildings are about finished and the four-drill compressor and boilers on West mountain are in place on old Islet millsite. Six-inch air-line pipe is laid from compressor to mouth of tunnel, a distance of 1200-feet. The powder house is completed; tunnel building is 40x45. An air stack is being built for ventilating tunnel.

At the Silver Basin, the powder house has been completed, and shaft house, 22x50, with compressor and timber room, 12x50, are nearly finished. The drainage tunnel has been connected with shaft and latter retimbered. The air drills will be started Dec. 1.

I. S. Johnson, lessee of the Gold Cup mine, will sink the incline 200 feet. The incline is down 800 feet, with a 50-foot winze.

J. J. Murphy has leased the Lamphier group, Ohio City. If developments are satisfactory he will put up a concentrating plant on property.

The Pittsburg-Gunnison Co., Ohio City, is shipping ore from the Granite Mountain to the Jersey Blue mill.

A new hoist and other machinery have been put in on the Lilly, near White Pine. Eight men are employed.

Supt. K. Gillespie of the Star, on Italian mountain, near Aspen, is pushing work on buildings, etc., to completion, and production of ore will soon begin.

The Doctor, on Spring creek, has closed down for the season. It will resume about April 1.

A whim is in on the Wizard Oil group, near the Doctor, and work will be pushed as long as weather permits. A good lead of ore was opened up recently.

A. R. Burnett will work the Lead King, near Crystal, during the winter.

The Ben Franklin, near Pitkin, is bonded to the Citizens' M. Co. for $50,000.

HUERFANO COUNTY.

The Colorado & Western Fuel Co., capital $350,000, are working coal mines in Bear Creek district, 2 miles west of Walsenburg. The company is figuring on the erection of a big plant and the employment of 200 men.

At the Ojo mines (copper), near La Veta, many men are working.

LAKE COUNTY.

(Special Correspondence).—The output of Leadville is running about 2400 tons a day, only about 500 tons of which are lead carbonates. The tonnage of the district comprises a considerable amount of iron oxides, but the bulk of the product consists of siliceous sulphides, carrying gold and silver.

Leadville, Nov. 10.

Mrs. J. E. Dunn of Leadville projects a mill on the St. Anthony next spring.

Another 80 H. P. boiler is being put in at the Valentine. A large double expansion pump will be placed on the 500-foot level.

The shaft at the Catalpa, Leadville, is down 500 feet.

E. D. Dickerman and others, operating the Pittsburg, on Fryer hill, have put in new machinery, retimbered the shaft, etc., and ore is being taken out.

Regular shipments are now being made from the P. O. S. shaft of the Nubian Co., Leadville.

The output of mines of Leadville district has increased 40% during the past year and amount of actual mining has almost doubled during that period. In 1899 the daily output was about 2000 tons. It is now between 3000 and 3500 tons.

The Northern, Leadville, J. W. Newell, manager, is getting out silver-iron ore, carrying 56% iron, silver values, and about 2% silica per ton. Output is about twenty-five tons per day.

On the California, Leadville, in eight months the company has erected a surface plant, has sunk shaft 530 feet, has cut two stations and put pumps therein, and has done considerable drifting. Sixty feet of shaft was sunk through dolomite.

The Home M. Co., Leadville, has put in a new fuel plant on the Penrose, to cost 25% less than that in ordinary use. It is a gas produced by pumping air through heated petroleum which carries with it one part of hydro-carbon gas to nine parts of air. At the Penrose boiler house five air-tight steel cylindrical tanks, 10 feet high by 5 feet in diameter standing on end, have been erected. Coiled steam pipes in these heat petroleum to 185° F. and hydro-carbon gas is thrown off. Air is then forced through a finely perforated false bottom, and, passing through the oil, carries with it the gas, which combines with air and is carried off to fire boxes under boilers. The tanks now being put in will be of 400 H. P. and will supply fuel for four large boilers at the Penrose and one at the Starr shaft.

A new plant is going in on the Little Chief, Leadville, and operations will resume.

The A. Y. & Minnie mill is treating 100 tons of ore daily from that mine.

A new plant is going in on the Robert E. Lee.

It is probable that a large hoisting plant will be put in on the Doris, Leadville, Manager Mamlock.

A new 13,000-pound pump, with capacity of 700 gallons on a 500-foot lift, is being placed at the Home Extension. A new 12x12 double-friction hoister is also going in. Manager Gaines reports shaft down 420 feet and that sinking progresses at the rate of 6 feet per day. A station will probably be cut on 450 or 475-foot level.

The shaft at the California Gulch, Leadville, is down 530 feet.

OURAY COUNTY.

J. M. Blatt and associates of Cleveland, O., who bought the Smelter Trust, Iowa and other properties near Ouray, Oct. 22, have begun sinking and development will be pushed.

The Camp Bird Extension M. Co., capital $2,500,000, owning nineteen claims adjoining the Camp Bird, will push development during the winter.

Work on the Black Diamond group, in Yankee basin, near Ouray, is being pushed by Manager L. D. Chelders. Machinery will be put in next spring and a tunnel run on the 200-foot level.

The report from Salt Lake City to effect that T. A. Rickard, while there, announced that sale of the Camp Bird had been concluded for sum of $6,500,000, is denied by Mr. Rickard, who wires from New York: "The statement quoted by The Times was entirely unwarranted. I said at Salt Lake City that the deal was still pending and that the original price was $6,500,000."

C. Newman, of Durango, is developing the Mono group, near Red mountain, Ouray. He has opened up a body of iron sulphides carrying from $8 to $15 gold to the ton.

Ore from the Matthews, near Red Mountain, recently assayed $\frac{8}{100}$ ounce gold, 22 ounces silver, and 74% lead per ton.

The Mountain Lion group, G. C. Franklin manager, will work three shifts—sinking, crosscutting, etc.

It is locally reported that T. A. Rickard, consulting engineer of the Venture Corporation of London, Eng., has announced that the price of the Camp Bird, Ouray, has been raised on account of recent successful developments.

PARK COUNTY.

Cincinnati men will develop property near Guffey, recently bought from Morath Bros. Mine will be equipped and work continued during the winter.

PITKIN COUNTY.

The branch railroad from Aspen to the

Newman tunnel is completed, and the new reservoir to supply power for air compressors will be finished next month, when it is expected shipments of ore will begin.

SAGUACHE COUNTY.

The Lucrative M. Co., operating the Eagle (silver) in San Luis valley, near Villa Grove, is sinking shaft, now down 250 feet, to 500-foot level. Many men are working and development will be pushed.

SAN JUAN COUNTY.

The Sunnyside Extension mill, Silverton, is running twelve hours daily. There are thirty men employed in the mine and mill.

The Freeport & Cripple Creek Leasing Co. has bought forty acres of land near Freeport, and will, it is said, put up a 100-ton mill.

The San Juan Chief, Mineral Point, E. M. Brown manager, is closed down for the season.

The Minnie Gulch M. & T. Co., in Minnie gulch, S. Martin manager, has eighty men at work.

The Ridgway, in Maggie gulch, is reported sold for $60,000. Twelve men will be kept on during the winter, and next spring an air compressor will probably go in and three tunnels be run.

Snow has prevented the "blowing in" of the Kendrick & Gilder smelters at Silverton. It is thought, however, that smelting will be begun Dec. 1.

SAN MIGUEL COUNTY.

The Shenandoah Gold Mines & Smelting Co. has bought the Shenandoah and Iron mines in Mt. Wilson district. It is said the company will put up a stamp mill with capacity of concentrating ten to twelve tons daily. Mill will be built about a mile from the mine and ores will be conveyed from latter by means of a 7000-foot aerial tramway at an estimated cost of 8 cents per ton.

SUMMIT COUNTY.

The 7x7 tunnel of the Gold Run Milling Co., Breckenridge, is in 150 feet.

TELLER COUNTY.

(Special Correspondence).—The output of Cripple Creek district for month of October is placed at 30,000 tons ore—6000 tons going to smelters and 24,000 tons to cyanide and chlorination plants, while that for November is estimated at 15% increase over that of October.

The Independence T. & M. Co., locally known as the Hull City, will increase its production, and the same is reported as to the Isabella. In general, it may be said that by Jan. 1, 1901, the big mines of the district will be in condition to work steadily and at their greatest capacity; every existing condition indicates a pronounced increase of ore tonnage for next year. The year 1900 will be noted for the numerous consolidations and for the large expenditures made for new equipment and betterments about the leading mines of the district, with result that the principal producers of the camp have to-day a class of boilers, hoisting engines, air compressors, electrical machinery, shaft houses and ore houses and other equipment that takes rank with the best in any part of the world.

In an article written from Florence, in this issue, the growth of milling facilities at valley points is noted. In this connection it may be predicted, with some degree of certainty, that there will be no more mills or reduction plants erected in Cripple Creek district. The disadvantage of operating them here, as regards water supply, fuel and other conditions, has been demonstrated, especially as custom plants. The largest mill in the district is the Economic and that is designed to operate solely on ores produced by one group of mines.

Despite the fact that the tendency of the mills is to have their own sampling works, the public sampler is and likely will continue to be a factor in the district. At present there are four or five of this class operating within the district. Among these the Rio Grande handled for October about 7000 tons, which will be increased for November.

The Oneida mill, not proving a success, has been abandoned and will be dismantled. WASCOTT.

Victor, Nov. 10.

(Special Correspondence).—A strike of rich ore was made by the Ophelia tunnel in its course through Mary McKinney grounds. The vein discovered will be thoroughly exploited by the Anaconda and Mary McKinney companies, as both are believed to possess an interest in it.

The Gold Dollar shipments for October amounted to 600 tons, worth $25,000.

The Last Dollar mine will pay a dividend of 2 cents per share on Nov. 21, amounting to $30,000. This is the first dividend paid since last February.

Cripple Creek, Nov. 10.

Mr. Jackson, leasing the Gold Sovereign, Victor, is pushing development. The shaft, present depth 375 feet, will be sunk an additional 100 feet.

Cripple Creek reports a strike in the property of the Gold Bond Con. M. Co., on Gold Hill. The vein has a width of 4 feet with an average assay of $200 per ton.

The Bonanza Leasing Co. are down 450 feet on the Temony, Cripple Creek; sinking will be continued. The lessees of the Indicator will probably put in new steam plant soon. Results are good, dyke matter $6.25, phonolite $11.80, and screenings from both have run $8.60 to ton. A new plant is going in on the Speeler, on Bull hill, Cripple Creek.

At the Princess Alice, Cripple Creek, foundations are under construction for a 10-drill compressor. The new electric hoist on the Gold Sovereign is hoisting ore from 400-foot level.

A strike has been made upon the 72-foot level of the Dante, Victor, by Sebeck and others, one assay yielding $1320 gold to the ton. An ore house is up and 10-ton shipments are made weekly. The Crest City Leasing Co. are drifting on 250-foot level on blocks 2 and 3 of the Dexter.

The 500-foot shaft on the Coriolanus, on Battle mountain, Victor, is completed. The Denver M. & Leasing Co. on the Victor Con. are crosscutting on 160-foot level. Ore runs about $8 to ton. The battery of boilers at the Portland shaft No. 2 are in ready for new hoist, which will be in place next month.

The Frankie S. Co. on Raven hill, Cripple Creek, have put in new steam plant and are crosscutting for the Joe Dandy vein at 100-foot level. The Elkton shipped 1057 tons ore during September, for which it received $98,994.24.

The Gilpin & Cripple Creek G. M. Co. have leased block 2 of the Atlanta, Cripple Creek, to C. Myers. Block 1 is leased to T. A. Collins and others. Work is in progress on both blocks and both lessees will put in steam plants.

The Blue Bird, Victor, will sink its shaft, now down 500 feet, to 1000-foot level.

The Jolly Jane, South Victor, has new gallows-frame in place and other improvements are nearly completed.

The new pumps are in at the Santa Rita, Cripple Creek, and drifting on 550-foot level is being pushed.

McNeil & Dingman, leasing the Zeolite & Bloomington claims, on Battle mountain, Victor, are pushing development.

The machinery at the John A. Logan, Cripple Creek, is running and work of connecting the Eagle with the Orpha May is progressing.

The Tipton is sold to D. Woodruff for $12,000.

Work at the Princess Alice is temporarily suspended while new air compressor is being put in. Operations will resume in about two weeks, it is thought.

A steam plant will be put in on the Bonzai, on Squaw mountain, Cripple Creek. Sinking is in progress, and at 100-foot level a crosscut will be driven.

J. Crawford has leased a block on the Australia, on Beacon hill, and has commenced development.

A new vein has been opened up on the 415-foot level in the Ironclad, Victor.

The plant at the Yellowbird, Cripple Creek, T. J. Moynahan operator, is running.

The shaft at the Tenderfoot, now down 300 feet, will be sunk to 400-foot level.

The machinery from the old shaft of the Eclipse has been moved to new shaft, and operations have resumed.

The Theresa Leasing Co. has opened up ore on 400-foot level of the Theresa.

The Anchor group, near Freeland, is reported sold to Colorado Springs and Eastern men for $50,000.

The Molly Dwyre, Cripple Creek, has closed down temporarily.

The controlling interest of the Comanche Plume Co. has passed into the hands of the Colorado Western Co., which will sink a deep shaft.

IDAHO.

CUSTER COUNTY.

The mills on the property of the Lucky Boy M. Co. at Custer have suspended operations for the season; M. Bamberger Supt. They will resume early next spring.

ELMORE COUNTY.

The Golden Age M. Co., Ltd., of Lincoln, Neb., H. St. Cyr manager, will work the Atlanta Con. mines at Atlanta. It is probable that they will put in a large plant. About thirty men will be kept on during the winter.

IDAHO COUNTY.

Near Buffalo forty men are working on the Big Buffalo. The Vesuvius employs twenty men.

SHOSHONE COUNTY.

Four new 5-stamp mills will be running next spring in the Pierce district.

MICHIGAN.

HOUGHTON COUNTY.

The reverberatory furnaces at the Calumet & Hecla smelting works at South Linden have been increased to more economically smelt low-grade ore. Each furnace has a steel-charging platform. The new stacks are 93 feet high. A 40x96 cupola will be ready by Dec. 15.

MONTANA.

FLATHEAD COUNTY.

Johnstone & Scarlett will put up a stamp mill on the Cedar gold claims, on Libby creek, near Libby, next spring.

MISSOULA COUNTY.

Missoula says: "This is the busy time for the mine owners, who have to perform their annual representation work. The number of affidavits that have already been filed with the county clerk and recorder show that hundreds of dollars' worth of work has been performed. All the old prospectors and miners are now being employed. Owners of mines who reside in other parts of the country secure all the idle men in this section to perform the work, and, as a result, very few idle miners are now in the city. Most of the work that has been performed so far this year has been in the district along the Cœur d'Alene branch. Judging from the affidavits already filed, the country is full of miners, who are rushing the work, that it may be finished before the cold weather sets in. The class of work that is being done depends on whether the mine is a quartz or a placer mine. The owners of placer claims in a majority of instances in their affidavits report the building of new sluice boxes. One or two have reported that several miles of this class of work have been done this summer."

PARK COUNTY.

The St. Julien M. Co., Livingston, is adding improvements to the mill. The latest consisted of an ore feeder.

SILVER BOW COUNTY.

On the 10th inst. fire broke out in the 200-foot level of the Bell, at Butte, and is still burning.

NEVADA.

ELKO COUNTY.

Output of the Dexter, Tuscarora, is 140 tons ore daily.

The new 10-stamp mill and cyanide plant of the Bull Run M. Co., near Tuscarora, are in successful operation. J. L. Powell is in charge of the mill and H. C. Messimer is in charge of the cyanide plant.

ESMERALDA COUNTY.

J. Chiatovich has ten men working on the Mary, near Silver Peak.

Supt. McCormick of the Vulcan, Hawthorne, says that the Parrott will resume and that thirty men will be employed. The shaft will be sunk to the 500-foot level and a 75-ton smelter will be placed on the property.

EUREKA COUNTY.

The Rocco-Homestake-Nevada, Eureka, has resumed payment of dividends.

The Eureka Tunnel mine and properties connected therewith are leased to M. Antoniazzi & Co. for two years.

The Whalen Con. Co. is putting on more men on properties near Eureka.

LINCOLN COUNTY.

The Quartette Co. at Searchlight has eighteen men working at the mine and sixty building the mill, on the Colorado river, 14 miles distant. A railroad to connect the mine and mill is projected.

STOREY COUNTY.

The main south drift on the Savage, Virginia, from the Gould & Curry tunnel, on the 425-foot level, is in a distance of 200 feet. The face is in vein porphyry, with seams of low-grade quartz through it.

WASHOE COUNTY.

On the 8th inst. the following board of directors for the Reno Smelting & Milling Co., Reno, was elected to succeed the old: H. M. Martin, J. B. McCullough, G. H. Taylor and O. J. Smith.

Mr. Curnow of Reno will run a 300-foot tunnel to tap ledge on property near Spanish Springs. Ore assays 24% copper.

NEW MEXICO.

SANTA FE COUNTY.

S. G. Burn, manager Galisteo Co., operating on Ortiz grant, near Dolores, says that the Edison process of extracting gold from gravel has proved a success at the experimental mill put upon the property. It is said that Edison will be in Dolores this month to make preliminary arrangements for the erection of a large plant.

SOCORRO COUNTY.

The Lead King and Lead Queen mines, in the San Andreas mountains, are reported sold to the Salinas Peak M. Co. for $100,000.

TAOS COUNTY.

The Black Copper, 5 miles from Red River, will put in a new mill. The Red River Copper Co. is building an engine and hoist house. Sinking is in progress.

OREGON.

BAKER COUNTY.

A good body of silver ore has been opened up on the Tempest, in the Greenhorn's. Work has been started on a 150-foot tunnel at depth of 40 feet. More men will be put on and shipping of ore begun.

The new shaft and connections for the Red Boy, Baker City, are on the ground and they are being placed in position. The shaft is of steel 18 inches in diameter and will lift nine tons 2000 feet. A flat woven steel cable is used.

The Laclede Con. G. & C. M. Co. is sinking and drifting on properties in Powder River valley, about 32 miles from Baker City.

F. S. Lack and others have bonded property of the old Nelson Placer M. Co., near Auburn. The company intends to work property by the California method, and will put in a hydraulic elevator.

GRANT COUNTY.

G. Thornburg has men working on the Belcher group, near Granite.

JACKSON COUNTY.

Opp Bros. of St. Louis, Mo., operating the McWilliams & Casey, on Jackson creek, near Jacksonville, intend to put in a 20-stamp mill and a cyanide or chlorination plant. Fifty men will probably be employed.

The Wolverine M. Co. of Montreal, Quebec, have sent twenty-five tons ore from their copper mine, 2 miles south of Jacksonville, to the Selby Smelting & Lead Co. of San Francisco for test.

JOSEPHINE COUNTY.

The Beach & Platter placer mine at Althouse, containing 500 acres, has been bonded by J. Conant of Redding, Cal.

The C. & C. (hydraulic) on upper Jump-off Joe, Galice, is leased to W. E. Davis and others of Chicago, Ill. Work will be pushed; J. B. Wetherell Supt.

SOUTH DAKOTA.

LAWRENCE COUNTY.

At Deadwood the Homestake Co. expects to start up the new 1200-ton cyanide plant by Jan. 1st. It is the largest cyanide plant in the country, being 345x200 feet. There are twenty-four tanks, for various purposes, which will take care of all tailings from three stamp mills, or about 2400 tons daily. There will be no crushing machinery. The tailings contain about $1.50 in gold per ton. The company expects to erect another cyanide plant nearly as large, on the north side of Lead hill, a mile from the other plant.

The statement of the Homestake M. Co. of Lead, just published, gives complete record of the company since its organization. There have been shipped from mills 2609 bricks, of an average weight of 140 pounds each, making a grand total of 365,260 pounds of gold, valued at from $65,000,000 to $70,000,000. Of this amount the company has paid in dividends $9,193,750—nearly one-half the capitalization of the company. It is estimated that the mine now has more than sixty years' supply of ore in sight.

UTAH.

PIUTE COUNTY.

G. F. Dalton, manager Dalton Co., Marysvale, expects to put up a new mill next year. The main tunnel, now in 400 feet, will be run 800 feet farther.

The Ross M. & M. Co., capital $10,000, is incorporated to work the Ross group.

SALT LAKE COUNTY.

Supt. A. Mayberry of the U. S. M. Co., Bingham, is pushing work on the new tunnel, etc.

It is reported that L. B. Doe and F. W. Wood of San Francisco, Cal., will establish sampling works in Salt Lake City.

The Sunbeam and El Ray mining companies will consolidate.

The Bullion of the Helen M. Co., near Boulder Springs, Supt. Nesbit, will put on more men. A winze will be sunk to the 100-foot level.

The Dewey mill, Bingham, is running on ore from the Ashland, near there.

The Shawmut mill has shut down temporarily, owing to failure of electric power from Jordan Narrows; work in the mines is progressing, however, twenty-six men being employed.

Supt. Carruthers of the Shoebridge Bonanza, Tintic, has made a good strike on the 525-foot level. Shipments of ore will soon begin. The new refinery of Bothwell & McConaughty, at intersection of

Fourth South and Tenth West streets, Salt Lake City, will be 20x40 feet, and will be built of brick and stone. Erection is under way and projectors expect to have it turning out bullion early in December.

Supt. A. Clayton of the New State, in Little Cottonwood canyon, is taking out ore, yielding, it is said, 40% lead, 41 ounces silver and several dollars in gold per ton.

SUMMIT COUNTY.

The tramway and other improvements at the Silver King, Park City, will be finished Jan. 1.

The Park City Record reports shipments through the Mackintosh sampler for week ending Nov. 10th as follows:

	Pounds.
Silver King	1,369,000
Daly-West	1,046,000
Anchor Con	177,000
Ontario	160,000
Loring	88,000
Total	2,840,000

TOOELE COUNTY.

Supt. Stackpole of the Overland mill, near Sunshine, is pushing work of construction and it is expected that plant will soon be ready to run through 100 tons ore per day.

The Sacramento, Mercur, recently shipped East 300 pounds gold dust from its cyanide plant to be melted into bullion. Brickwork on roaster is under way and latter will probably be handling ore by Jan. 1st. The new pumping plant at the Honerine, Stockton, Manager Scheu, is running.

On the 8th inst. the property of the Geyser-Marion M. Co., Mercur, was sold at sheriff's sale by A. B. Sawyer, representing McCornick & Co., in whose favor judgment was recently confessed for $13,288.

UTAH COUNTY.

The Vira M. Co., capital $25,000, is incorporated at Provo, G. A. Storrs Pres.

WASHINGTON.

FERRY COUNTY.

The Bryan & Sewall, Republic, after a year's shut-down, has resumed. The ore is of a smelting quality carrying gold, silver and lead. Sinking will be done to the 300-foot level. P. O. Rothrock is manager.

The south drift on 300-foot level of the Chico, Republic, is in 163 feet.

Supt. D. I. Nickerson of the Butte & Boston has crosscut 140 feet, striking hanging wall at 100 feet and running 13 feet through ledge to foot wall.

Sinking on the Hercules shaft, Republic, progresses at the rate of 10 feet per week.

Supt. Downing of the Tom Thumb is sinking a shaft at the rate of about 3 feet per day. The shaft, now down 285 feet, will be sunk to the 400-foot level.

The Zela M., Sheridan Camp, is closed down for the winter.

At the Quilp, Republic, more men will be put on when mills are ready for ore.

The California shaft is down 100 feet; a 20-foot drift has been started eastward on vein. Road from the mine to Meyers Falls stage road is completed.

F. Gauthier says that the Golden Harvest will resume.

H. Hissel and J. Carmany are sinking on the Sailor Boy, Nine Mile creek. Ore averages $8 gold and six ounces silver per ton.

OKANOGAN COUNTY.

At the Puritan mines, near Loomis, Mgr. Jackson has everything in shape for winter work. Flume is nearly completed and the air compressor will soon be in. R. Baggaly, Supt.

The Golden Zone mill is shut down to put in new plant. Mgr. Meskimen is pushing work of mining and tunneling.

Mgr. Chilson, of the Utica-Oro Fino is pushing work on tunnel.

STEVENS COUNTY.

It is stated that a refinery will be built in connection with the smelter at Northport.

WYOMING.

The directors of the Wyoming D. & T. Co. have declined an offer of $100,000, for an option for one year, for the purchase of their Acme and Lakeside gold mines, Lakeside placer, saw mill and stamp mill at Gold Hill at a price of $1,250,000.

FREMONT COUNTY.

South Pass reports a strike of telluride of gold in the Carissa; Charles Van Sickle manager. The mill is running steadily and a contract for 2000 cords of wood for use this winter has been let.

FOREIGN.

BRITISH COLUMBIA.

At the Paradise group, in Windermere district, Manager Bruce says he has 2000 tons of ore sacked and ready for shipment. Rate per ton from mine to Golden is $7.

A six months' bond for $19,000 has been taken on the Iron Horse group, on Ten Mile creek, Slocan. Bonders are organizing company and will develop property; W. Manley, vice-president and general manager.

J. McGregor of Vancouver contemplates a 250-ton pyritic smelter in Boundary district.

The 18-drill compressor at the Columbia Kootenay, Kootenay, has been transferred to new foundations and operations have resumed. It is thought that forty additional men will be put on soon.

The output from the mines in the Rossland district to Nov. 1 is as follows:

Le Roi	135,078
Center Star	25,110
War Eagle	10,663
Le Roi No. 2	2,267
Iron Mask	1,875
I. X. L	420
Giant	414
Evening Star	351
Monte Christo	273
Iron Colt	80
Spitzee	20
Total	176,551

J. P. Graves, general manager Miner-Graves syndicate, says that the Granby smelter will be increased as soon as new furnaces can be built, to provide daily capacity of 1200 tons. He says: We are mining and smelting at a profit all ore that has a value of $6 per ton and upward.

The Boundary Creek M. & M. Co., Boundary Creek, will resume operations.

The second cleanup of the season of the Consolidated Cariboo Hydraulic M. Co., Ltd., of Cariboo district, made on Oct. 1 after sixty-eight days' run, amounted to 9040 ounces gold, valued at $154,765.

A. F. Rosenberger of Nelson proposes to take over property of the Anderson Lake M. & M. Co., near Ashcroft. If consummated, Mr. Rosenberger will put in a 40-stamp mill.

There are 500 men employed in and around the Trail smelter.

Supt. Martin of the City of Paris, Grand Forks, is shipping ore again.

Men are at work at the Betts group, Finch & Campbell, owners.

A diamond drill will be used on the Earthquake group, in Brown's Camp.

A machine drill will be put in on the Rainbow, on Lake Pend d'Oreille.

The Slocan-Sovereign Co. of Montreal has twelve men working on the Argenta, near Sandon.

Wilson Bros., owners Bird's Eye, near Nelson, contemplate erecting a stamp mill.

The Sailor & Minnehaha mines, Greenwood, will resume this month.

A new hoist goes in on the Waterloo.

MEXICO.

D. S. Cuilty, operating a copper mine near the Santo Domingo Placers, Chihuahua, has four shafts 70 to 90 feet deep. Ore taken out runs 23% copper per ton.

SOUTH AFRICA.

It is reported that a new diamond field has been found near Griquatown, Cape Colony.

Commercial Paragraphs.

The American Steel & Wire Co. have ordered from time to time eighteen Cross oil filters for use in their plant at Chicago, Ill.

The Gates Iron Works, Chicago, has an order for a complete gold milling plant for Borneo and a cement plant for Hongkong.

The Sandusky, O., Tool Co. has an order from a San Francisco company for 12,000 planes, with an extra iron for each plane, to be shipped to China.

The S. H. Supply Co. of Denver, Colo., recently shipped a carload of machinery to the Grand Ledge mine at Kelly, N. M.; also an air compressor to Pitkin, Colo. This company has purchased the machinery in the Royal George mill at Canyon City, the Colorado Experimental Works at Boulder, the Malichite mine at Morrison, Colo.

The Ericsson Telephone Co., New York, recently received the following from J. J. Sullivan, Supt. Pioneer G. M. Co., Towle, Placer county, Cal.: "The desk telephone purchased from you last month is connected up and is giving the best of satisfaction, and works better than any of the phones I have on any of my lines. I have several different makes of telephones on the different lines, but your Swedish phone beats them all, and your desk set is a beauty compared with the style of the ones I have seen."

Under date of Sept. 17th, W. Z. Kinney, Supt. Gold King Con. M. Co., writes to the Weber Gas & Gasoline Engine Co. of Kansas City, Mo.: "We have had one of your 25 H. P. gasoline hoisting engines in constant use at our mine, situated at an altitude of 12,125 feet above sea level, for the past year and a half, and have found it very satisfactory indeed, doing all that you claim for it, and being very much cheaper to operate than a steam plant. We have no hesitation in recommending it to any one requiring an economical hoisting plant."

The Colorado Iron Works of Denver, Colo., are furnishing the machinery for the new milling plant of the War Eagle Con. M. Co., near Placerville, Boise basin, Idaho, consisting of stamps, rolls, chlorinating barrels, Bruckner roaster and Bartlett tables. This company also have an order for a carload of water jackets for the Guggenheim smelting plant in Mexico. They are turning out from twenty to thirty Bartlett tables per month. The Portland G. M. Co. of Victor, Colo., has placed an order with them for several double-decked safety mine cages. They also have an order from the Globe smelting plant at Denver, Colo., for eleven sets of gearings for their Bruckner roasters. They also have an order from the Tezintlan Copper Co., Mexico, for the ironwork for a reverberatory matte furnace. Morris & Elspass, Pueblo, Colo., have placed an order with them for a crusher, boiler and engine. The Hoffman Smelting & Reduction Co. have ordered a 48-inch, round copper furnace, with necessary equipment to accompany it. They are filling an order of the Seminole Mining Co. of Georgia for a set of 27x14-inch crushing rolls, with elevators and screens.

Personal.

M. M. Van Fleet is in Denver, Colo.

Letson Balliet is in eastern Oregon.

T. Jennings of Salt Lake, Utah, is in Arizona.

V. P. Strange of Salt Lake, Utah, is in Idaho.

J. J. Cusick of Montana is in Salt Lake, Utah.

G. B. Brown is now manager Millinee, Aspen, Colo.

A. W. Huchins of Chicago, Ill., is in Auburn, Cal.

G. J. Weber of Kansas City, Mo., is in Willcox, Ariz.

H. E. Nieve of England is now located in Rossland, B. C.

A. C. Wagg of Portland, Or., is in Colorado Springs, Colo.

F. Drury of southern California has gone to Pitkin, Colo.

M. B. Greenwood of Anaconda, Mont., is in Salt Lake, Utah.

A. P. Schumacker of Denver, Colo., is in Salt Lake City, Utah.

C. Lowery of Salt Lake, Utah, has returned to Rossland, B. C.

W. A. Watson, late Supt. Economic mill, Victor, goes to Cuba.

C. Hull of Salt Lake City, Utah, has gone to Good Springs, Nev.

J. Dederichs of Salt Lake City, Utah, has gone to Spokane, Wash.

R. A. Huntley of Salt Lake City, Utah, is in South Pass, Wyo.

J. F. Korbel of the Texas, Grass Valley, Cal., is in San Francisco.

W. R. Beall, Supt. Bullychoop, Cal., property, is in San Francisco.

G. E. Turner & Son (R. H. Turner) of Grass Valley, Cal., go to Mexico.

F. Nagre of the La Grange M. Co., Redding, Cal,, is in San Francisco.

F. B. Turner of Butte, Mont., is examining mines near Prescott, Arizona.

C. D. Galvin of Weaverville, Cal., has returned there from San Francisco.

W. Weston, Cripple Creek, Colo., has returned from White Hills, Arizona.

J. Canning, late manager Millinee, Aspen, Colo., has gone to New York.

Supt. McMasters of the Clyde mine, Colorado Springs, Colo., has resigned.

President Cohen of the Con. Mercur, Mercur, Utah, is in Shasta county, Cal.

O. W. Klinger of the Standard, Silverton, Colo., leaves for California, Mo.

Supt. W. McG. Logan of the Old Home, Grass Valley, Cal., is in Oakland, Cal.

Loughbridge & Turner of Chicago, Ill., have returned there from Marble, Colo.

G. S. Wilson of Edinburgh, Scotland, has gone to Arizona from Elizabethtown, N. M.

W. H. Hile, manager Last Chance M. Co., has returned to Weaverville from San Francisco.

W. E. Hampton of the Pacific Tank Co. has returned to Los Angeles, Cal., from the East.

T. B. Scott of the Lucky Boy, near Chloride, Ariz., has returned there from San Francisco.

Simeon Wenban, an old successful Nevada miner, is seriously ill at his home in San Francisco.

W. T. Kendrick of Denver, Colo., Pres. Kendrick-Gelder Promotion Co., is in Silverton, Colo.

J. R. Phillips of the Banner mine, Grass Valley, Cal., has returned there from Stockton, Cal.

P. Edwards of the Reno Smelting & Milling Co., Reno, Nev., has returned there from the East.

A. Gassaway, formerly Supt. West Harmony, Grass Valley, Cal., has gone to North Bloomfield, Cal.

Supt. P. Tautphaus of the Providence, Grass Valley, Cal., has returned there from San Francisco.

S. T. Miller is elected secretary Rittenhouse G. M. Co., Cripple Creek, Colo., vice C. H. Bryan, resigned.

P. J. Quealey, manager Kemmerer Coal M. Co., Kemmerer, Wyo., has returned there from Salt Lake, Utah.

G. H. Sampson, president Rand Drill Co., 128 Broadway, New York, has returned from an extended trip abroad.

R. Billings of the new smelting company at Florence, Colo., has returned to the latter place from Salt Lake, Utah.

H. Stoecke of Greenwood, B. C., is back from a three months' trip to San Francisco, New York, Paris, Berlin, etc.

General Manager Truman of the Ray mine, Kelvin, Ariz., goes to New York on business connected with the company.

J. B. Hastings has resigned the superintendency War Eagle and Central Star mines, Rossland, B. C., and has gone to Victoria, B. C.

J. J. Guentherodt, during the past year mining editor Leadville, Colo., Herald-Democrat and Daily Leadville Miner, is in San Francisco.

W. F. De Camp has resigned the superintendency of the Lillie mine, Cripple Creek, Colo., and will make his future headquarters in Denver.

Spencer Miller of the cableway department of the Lidgerwood Mfg. Co., New York City, has returned from Europe after a four months' absence.

Mr. Stackpole, former Supt. Chloride Point mill, which was recently closed down for the winter, is now Supt. Overland mill, near Sunshine, Utah.

B. S. Phillips of Denver, Colo., an Prof. Bentz and Messrs. Longcoop an Pike of Philadelphia, Pa., have been look ing over mining properties near Grafton N. M.

Prof. W. H. Watts has finished Bu letin 19 on the "Oil Formations of Cal fornia." It will be published by the State Mining Bureau, and will be ready for distribution about Dec. 10.

Curtis H. Lindley, B. F. Lacey and Chas. G. Yale were on the 12th inst. elected president, vice-president and secretary, respectively, of the San Francisco County Miners' Association.

Charles Bagdonovitch, a Russian mining engineer, who left San Francisco on the steamer Samoa last May with others to explore mining concessions in Siberia, has returned to San Francisco.

W. C. Ralston declines to have his name considered in connection with reelection as president of the California State Miners' Association. He thinks it is a good idea to have a new man every year in that important position.

C. L. Cory of the San Francisco engineering firm of Benjamin, Meredith & Cory has been appointed consulting engineer of the San Francisco Board of Public Works, to investigate the problem of an electric lighting and power plant for the municipality of San Francisco.

Obituary.

MARCUS DALY.

Marcus Daly of Anaconda, Mont., president Amalgamated Copper Co., and one of the leading mine owners and operators of the country, died in New York City on the 12th inst., in the 59th year of his age.

A native of Ireland, he had been for twenty-five years a resident of Montana. He was manager Alice mine many years ago, and, later, came into prominence in connection with his copper holdings and the big mining and political fights with W. A. Clark. In the copper mining interests of Montana nearly every one was either a Clark or Daly man, and the successive victories or defeats of either faction made constant stir, while the magnitude of the financial interests involved lent considerable importance to the strife, to stockholders in the East.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR WEEK ENDING NOV. 6, 1900.

661,135.—MORTISING MACHINE—G. F. Andrews, Riverside, Cal.
661,303.—AIR INJECTOR—J. S. Briggs, Los Angeles, Cal.
661,284.—GAS GENERATOR—H. E. Brunner, Haywards, Cal.
661,467.—SEAL LOCK—A. W. Coffin, S. F.
661,045.—LOCOMOTIVE—G. S. Fouts, S. F.
661,144.—STAMP MILL—Hamm & Taylor, S. F.
661,184.—AMMONIA COMPRESSOR—J. T. Ludlow, S. F.
661,377.—FLEXIBLE JOINT—J. C. & J. C. Martin, Jr., S. F.
661,190.—POT COVER—A. Olson, San Diego, Cal.
661,193.—DREDGER—W. W. Priestley, Smartsville, Cal.
661,277.—HYDRAULIC BRUSH—E. A. Rix, S. F.
661,160.—SWELLING TANK STAVES—J. M. Thorp, Alameda, Cal.
661,362.—PAVEMENT COMPOUND—H. F. Williams, S. F.
33,520.—DESIGN—J. T. Davis, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC WEIGHING SCALE.—No. 660,794. Oct. 30, 1900. E. Hanak and George Hoepner, San Francisco, Cal., assignors to Union Scale & Manufacturing Co. The object of this invention is to provide an automatic weighing scale, in which there is an oscillating tilting compartment, a weighing bucket movable with relation to a fixed discharge, so that the compartments are alternately filled and discharged. Latches are provided for holding the bucket in either position to which it may be tilted, and means for disengaging the latches after the bucket is filled. The invention also comprises a novel arrangement of feed or supply hopper.

WEATHER STRIPS FOR DOORS OR WINDOWS.—No. 660,839. Oct. 30, 1900. J. E. Bundy, San Francisco, Cal. This invention relates to a device for hermetically closing the bottoms of doors, windows or the like against the entrance of wind, rain and snow. It consists of a movable tilting strip forming a continuation of the threshold or seat over which the door normally closes and so guided that when the door is closed the inner edge of the strip will be tilted upwardly against the lower edge of the door and form a joint with a molding of suitable character which fits across the lower part of the door for that purpose. When the door is opened this piece falls by gravitation to its normal position where it forms a part of the threshold.

DEVICES FOR COLLECTING FINELY DIVIDED MINERALS AND SLIMES.—No. 660,844. Oct. 30, 1900. W. E. Darrow, Sonora, Cal. This invention relates to an improved apparatus for concentrating and collecting high-grade mineral. It consists of submerged inclined surfaces, upon which the mineral is concentrated, means for precipitating and eliminating the heavy waste gangue, while the fine particles in suspension flow on with the water and may be collected in reservoirs for future treatment. It comprises a stationary tank having surfaces inclined toward the longitudinal sides, so that the heavy material will slide therefrom and the lighter material will collect thereon. Means are provided for supplying water from below to fill the tanks and submerge the surfaces, and means for supplying material to pass through the tank and over the surfaces. There is a discharge at the opposite end, and a transversely corrugated or channeled bottom having openings through it, discharging into a closed receptacle which is also filled with water, so that the heavy sediment gradually passes through the openings into the lower compartment without agitation in the upper compartment.

San Francisco Stock Board Sales.

Latest Market Reports.

SAN FRANCISCO, Nov. 15, 1900.

SILVER—Per oz., Troy: London, 29¾d (standard ounce, 925 fine); New York, bar silver, 64¾c (1000 fine); San Francisco, 64¾c; Mexican dollars, 51c.

COPPER.—New York: Lake, 1 to 3 casks, $17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.75; carload lots, 16.60. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.35; Salt Lake City, $4.00; St. Louis, $4.22½; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £17 12s 6d.

SPELTER.—New York, $4.20; St. Louis, $4.05; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $14.00; gray forge, $13.50; San Francisco, bar, per lb., 2½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $19.50; open hearth billets, $22.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $27.50; San Francisco, ton lots, 30c; 1000 ℔s., 30½c; 500 ℔s., 30¾c; less, 31c; bar tin, ₱ ℔, 35c.

QUICKSILVER.—New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.50 ₱ flask of 76½ ℔s.; Export, $45.

NICKEL.—New York, 50@60c ₱ ℔.

MAGNESIUM.—New York, $3.00 ₱ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¼c; slab, 5¾c; bar, 7c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-℔. lots, 18.70c; San Francisco, Plumbers', 100-℔. lots, 15.85c.

ASSAY LITHARGE.—San Francisco, 10c ₱ ℔, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

BISMUTH.—New York, ₱ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

PHOSPHORUS.—F. o. b. New York 50@60c ₱ ℔.

TUNGSTEN.—New York, ₱ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN.—New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE.—Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.—San Francisco, crude, $17 ₱ oz.; New York, $18.20 per Troy oz

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per ℔., in carload lots, 15½c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ₱ set; 14 oz., 40s., 10½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c ₱ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ₱ ℔.; soda ash, $1.60 ₱ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ₱ ℔.; blue vitriol, 5½@6c ₱ ℔.; borax, concentrated, 7@8c ₱ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ₱ ℔.; caustic soda, in drums, 3@4c ₱ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ₱ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

Recently Declared Mining Dividends.

SITUATIONS WANTED.

WANTED.—A position as superintendent for a mining company by a man of 16 years' practical mining experience; understands mining and milling (amalgamation, concentration and leaching); good assayer and accountant; would accept a subordinate position if good; references. Address "Advertiser," 1225 Webster St., Oakland, Cal.

A sober, industrious young man, who is a competent assayer, surveyor, draughtsman and bookkeeper. wishes a situation. Has had eighteen months' practical experience and two years' technical training. Is willing to make himself generally useful about a mine. Salary small object; opportunity to show ability considered first. References. Address "M." Mining and Scientific Press.

MINING ENGINEER (technical training), twenty years' experience as surveyor, assayer, superintendent and manager of mines and mills; business qualifications; linguist; at present general manager mining and milling proposition in Mexico; desires to make a change on account of health; best references. Address S. O., Mining and Scientific Press.

Mining engineer with ten years' experience in copper and lead mining, milling and smelting, desires to secure position as superintendent or manager of developing or producing property in this country or abroad. Good assayer, surveyor and bookkeeper. Address "Montana," care of Mining and Scientific Press.

EXPERIENCED MINE FOREMAN, who is a competent assayer and surveyor and has a good knowledge of Spanish, desires a position. Address O. R., care of Mining and Scientific Press.

WANTED.

A Second-Hand Diamond Drill.

Must be in first-class condition and complete in all respects. Address H. R., Mining and Scientific Press.

WANTED —The address of Thomas Watts, bricklayer and miner, formerly of Butte, Montana, and Denver, Colorado. If dead or alive, any information will be thankfully received by Will B. Cameron, 409 Main St., Seattle, Wash.

Charcoal Burner wanted. Must speak Spanish and be capable of burning 1200 cords of mesquite per month into charcoal for smelting. Healthy part of Sonora, Mexico. Salary $100 gold per month. Only sober man need apply. References and record of experience required. Address C. Coal, this office.

WANTED—FOR IMMEDIATE DELIVERY,

One Direct Acting, Double Drum Hoisting Engine; Cylinders about 18x40 or 20x42.

Equipment with post brakes and auxiliary engines preferred. Wire description and price. B. A. C., Rossland, B. C.

REFRACTORY ORES WANTED.

1000 TONS or more which will assay $75.00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.

C. J. TALLON,
308 MARKET STREET, SAN FRANCISCO, CAL.

22nd and Larimer Sts., DENVER, COLO.

FOR SALE.

One 10″x12″ Double Cylinder, Double Drum Mine Hoist.
One 14″x30″ Duplex Air Compressor, Corliss Steam ends.
Two 54″x16′ Return Tubular Boilers.
One No. 6 Llewellyn Feed Water Heater.
One 36″x9′ Air Receiver.
One Duplex Boiler Feed Pump.

All in good working order and nearly new. Also Rock Drills, Sinking and Station Pumps, Air Pipe, Ore Cars, Skips, Wire Rope, Blacksmith and Carpenter Tools. A bargain for anyone wanting an up-to-date mine equipment. Address Box 376, this office.

FOR SALE.

A group of manganese mines, five in number; 100 acres of mineral land on Government land. Timber and water; 22 miles from railroad depot at Ukiah or 4 miles from railroad track or depot in Redwood valley. The Cave and Franklin mines are from 5 to 12 feet wide, solid manganese ore, high grade. The Black Jack mine is over 20 feet wide on the surface. These mines can be bought very cheap, with many other mines in the same vicinity. For further information, apply to

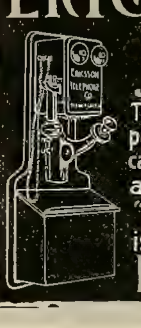
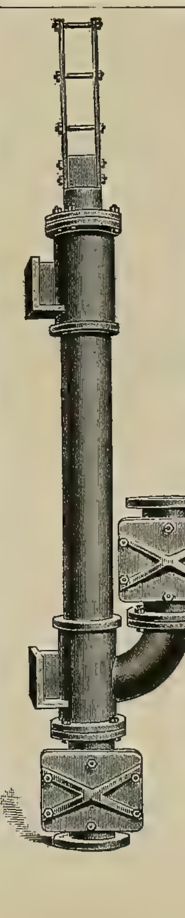
ERICSSON SWEDISH TELEPHONES



ERICSSON TELEPHONE CO.

Seem to possess almost human intelligence. They respond to every requirement in a smooth, positive fashion that shows what a perfect telephone can do. Besides this they have unequalled strength and durability. Their reputation as *"STANDARD OF THE WORLD"* is built on merit. Is the best too good for you?

ERICSSON TELEPHONE CO. *296 BROADWAY NEW YORK.*



POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily repacked.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.
Send us your inquiries.

From Brazil comes a statement illustrating in a variety of ways the value of technical education, and also illustrating incidentally what personal push will do. A young man had drifted there from an Eastern city, and, though desirous of employment, found little encouragement in the town where he had determined to stay. The situation was discouraging, when the municipal authorities there concluded that they would install an electric light plant and utilize an adjacent water power. They wanted an electrical expert to examine plans, make estimates, come to this country and get the needed machinery, and the fact having been mentioned to the young man, whom we will call Smith, he at once announced himself as a first-class electrical engineer, though, as a matter of fact, he knew no more about electricity than electricity did about him. However, on the strength of his own recommendation and self-assurance, the Brazilian authorities engaged him, and with a New York draft for needed expenses he sailed for the North on the next steamer. Immediately upon his arrival, he began a special course of study in electrical engineering, besides attending a night school for the same line of instruction. Besides his assurance he was also endowed with considerable physical strength and staying power, and stood the double strain for a month, by which time he had sufficient working knowledge of the matter to enable him to attend to his errand. He bought and brought back the machinery to the Brazilian town and is at present installing it to the satisfaction of all concerned. This is the story as given, and it sounds as if it might be true. The incident is in no wise commended nor commendable; but, without prescribing or proscribing such action, it is cited as characteristic of the qualities that often push men to the front.

California Miners' Convention.

The ninth annual convention of the California State Miners' Association assembled at Golden Gate Hall, San Francisco, on the morning of the 19th inst. The delegates were welcomed in an address by the Mayor of the city. The Credentials Committee reported delegate representation from the several counties as follows:

San Francisco 57, Butte 26, Calaveras 24, Alameda 20, Santa Clara 7, Nevada 60, Placer 58, Los Angeles 6, San Diego 2, San Bernardino 1, Kern 19, Inyo 1, Plumas 11, Sierra 22, El Dorado 15, Amador 37, Tuolumne 10, Yuba 10, Fresno 5, Marin 5, Solano 5, Shasta 35, Mariposa 2, San Luis Obispo 5, Santa Barbara 5, Napa 1, Sonoma 4, Trinity 1, Siskiyou 1, Madera 1; also, from the Sacramento Chamber of Commerce 5, University of California 1, California Petroleum Miners' Association 14, Southwest Miners' Association 5, San Francisco Chamber of Commerce 5, Stanford University 1, Fresno Chamber of Commerce 5, Los Angeles Chamber of Commerce 5, honorary delegates, Senators and Congressmen 9; a total of 505.

The president read his annual address, dealing with all the questions that have been before the consideration of the Association during the preceding year, welcomed the delegates from the California Petroleum Miners' Association, who were for the first time represented in the State Miners' Association, and went into the history of debris legislation concerning the hydraulic miner at considerable length. He expressed belief that the mineral lands bill would pass at the next session of Congress, recommended the building up of county branch associations through the State, and suggested that the Association's secretary be paid a salary. He showed that the California State Mining Bureau should be maintained under the regular appropriation bill instead of depending for the necessary funds for its existence on the biennial caprice of legislators. President Ralston made a fine address, which was received with applause by all present.

Secy. Benjamin and Treas. Hendy reported, showing an increase in membership and $3,208.65 in the treasury, with all bills paid. The receipts during the year were $11,215.41; disbursements, $8,006.76.

Two of California's newly elected Congressmen—Coombs and Woods—made addresses.

The first committee report was from the committee on legislation and was read by Chairman Jno. F. Davis of Amador county. It said in part that the committee adheres to the proposition laid down by it at the convention in 1899 and that the remedial legislation with reference to the law of mining, in almost all its phases, should be amendatory of existing Federal law, rather than independent statutory enactment at the hands of the Legislature. The law will lose nothing of directness and efficacy thereby and the uniformity so much desired will be promoted. The present mining law of California is, roughly speaking, the Federal Lode law of May 10, 1872, and the Act amendatory thereof, the whole being codified in Sections 2318 to 2346, inclusive, of the Revised Statutes of the United States.

The salient features of the sections referring to quartz mining are contained in Sections 2319, 2320, 2322 and 2324, and the legislation recommended to Congress by the committee refers to amendments of three of those four sections. The committee recommended that these sections be amended in three particulars: In the provisions concerning the marking of the exterior boundaries on the ground; in the provisions concerning the local rules, regulations and customs of miners and State and Territorial statutes on location of claims; and in the provisions concerning annual assessment work.

In the requirements for the marking of exterior boundaries upon the ground, under the present provisions of the law, the rights of the discoverer of a vein are not fully protected. Unless he be given a reasonable time to mark his boundaries upon the ground, either under a State statute or a local rule or the decision of the Supreme Court of the United States, he may make many mistakes vital to his interests. As a matter of fact, the trend of the California decisions on this point is against him, though at the same time against the trend of the decisions of almost all the other States and Territories except Oregon. The committee recommended to Congress an amendment to Section 2324 in this respect, drafted upon lines analogous to those in the late State statute repealed in 1899.

Concerning the second point referred to by the committee, the recognition in Federal statutes of local rules, regulations and customs of miners and State and Territorial laws concerning location of claims, Chairman Davis cited Judge Beatty to the effect that the whole subject of mining locations is an extremely simple one, which may easily and therefore ought to be regulated by one general law, the terms and existence of which shall be established by public and authentic records and not left to be proved in every case by the oral testimony of witnesses or by writing contained in loose papers or memorandum books, such as are often dignified by the name of mining records. The tainting of every mining title in the land at its very inception with the uncertainty which results from the actual or possible existence of rules affecting its validity, perfectly authentic evidence of which is nowhere to be found, is a stupendous evil. Experience has demonstrated that such an uncertian state of the law is a prolific source of litigation and no experience is required to convince any man of ordinary intelligence that it must have the effect of depreciating the value of all unpatented claims by deterring the more prudent class of capitalists from investing in them. That the subject is simple enough to be embraced in one general law is proved by the fact that the laws of the various districts, although differing in details, are in substance identical, and are substantially contained in the existing acts of Congress. "The magnitude of the evil resulting from the uncertainty of mining titles will perhaps be appreciated when I say that after a residence of seventeen years with the best opportunity of observing, I cannot at this moment recall a single instance in which the owners of really valuable mining ground have escaped expensive litigation, except by paying a heavy blackmail. This defect in the law, like the one concerning a want of reasonable time to mark boundaries in making a location, can be cured by an amendment of the law itself." In this instance the committee made the same recommendation made to Congress by the Public Land Commission in 1880, namely, the amending of the present law so that all future occupation, location or purchase of mineral lands shall be governed by laws of Congress to the exclusion of all local customs, rules and regulations and all State and Territorial law.

"The third provision in the law in need of amendment is the provision in Section 2324 concerning annual assessment work necessary to hold the possessory right to a claim as against the Government of the United States. The abuse of the present provision is so persistent, so flagrant and so well known that it is needless to describe it. Probably every man in this convention has, at some time in his own personal experience, been guilty of straining the present provision of the law upon this subject. We all recognize the statute concerning annual assessment work as insufficient, however, and most earnestly urge upon Congress such amendatory legislation in this regard that while it will provide a liberal system for the bona fide locator who holds and works his claim in good faith, will still most effectually and incontinently work for the undoing of every blackmailer and every dog in the manger."

The report discussed at length the present Federal statute concerning hydraulic mining in the Sacramento and San Joaquin valleys. Concerning the constitutionality of the Caminetti Act, the report said:

"Let the question be presented squarely, so that there can be no evasion in the decision. Is, or is not, the Act contrary to the provisions of the fifth amendment to the Constitution of the United States? Does, or does not, the Act, directly or indirectly, deprive any person of property without due process of law? Is the State deprived by the Act of any right guaranteed it in the constitution of the United States to protect the navigability of its streams? If the Act is held to be constitutional, as the miners are satisfied to take their chances under it, they will have to submit to the jurisdiction of the commission, for otherwise their hydraulic mining, no matter how little injurious, will be unlawful. They would then at least have this much security in expending the moneys necessary to take advantage of its provisions—that they would run no danger of having the Act declared unconstitutional over their heads after they had spent their money. If the Act shall be held unconstitutional, then those who have already submitted themselves to its jurisdiction would cease expending further money under it, and can apply for the cancellation of their surrenders on the ground that they were given without consideration."

The report of the committee on mineral lands was read by Chairman Jno. M. Wright, recounting the history of this well known measure, and giving the experience of those who were seeking the passage of a bill through Congress providing for a commission to classify the lands of the State, so that no more mineral lands would be absorbed by corporations as agricultural land. He said that, no matter which way the supporters of the bill turned, they found some technicality or some objection that put off its passage until too late. The report recommended that "the Association should continue its support of the Mineral Lands bill now before Congress, and to this end a strong mineral lands committee should be appointed, headed by some gentleman able to give a large proportion of his time to the accomplishment of the Association's purposes."

The report went into details of the conflict between "scrippers" and locators. The difficulty of the oil locator was that it is sometimes several weeks, and even months, before he can tell whether or not he is on an oil-producing claim, and in the meantime the scripper can come in and "select" the land under his scrip, which entitles him to agricultural land only. If the scrippers would select unappropriated lands where the presence of mineral was not apparent, said Mr. Wright, no one would question his right to a patent, nor would his right to mineral afterward discovered be questioned. But in very many instances the scripper has selected land within the well known limits of oil fields, lands known to him to contain vast quantities of oil; and he has even gone further and selected land upon which derricks had been erected and upon which wells were being sunk.

It was the purpose of the committee to prepare a bill that would protect the oil locator until he had either discovered oil or had demonstrated that there was no oil in his claim. The bill provides that locators should have three months after the marking of their claim within which to begin work for the purpose of completing discovery—the discovery, if made, to date back to the time of the location, in order to secure a continuous title. It provides further that so long as work is carried on with reasonable diligence the locator shall be protected, but if he fail to prosecute the work diligently, or if he fail to commence it within the three months allowed, he shall forfeit his claim.

Upon assembling on the morning of the second day, the 20th inst., the president appointed a committee on resolutions. The chairman of the committee on mines and mining reported that material progress had been made. In the current press is greater and more favorable mention. The last meeting of the International Mining Congress at Milwaukee, Wis., in June, 1900, unanimously endorsed and recommended the passage of a law by Congress creating a department of mines and mining. A bill providing for the creating of a cabinet office as so designed was favorably reported on by the House committee on mines and mining at the last session of Congress. When the extent of territory affected, the diverse interests, and the natural public inertia is taken into consideration, the committee felt encouraged in the evidence of progress, and expressed its belief that the measure, by reason of its manifest justice, will receive the favorable consideration by our national legislators to which its importance entitles it. The committee recommended that every member further the movement by personally addressing his Senators and Congressmen, and suggested to miners everywhere that if similar concerted action be taken by them that such united request would greatly hasten the ultimate fulfilling of the effort. The committee did not deem it needful to recount or repeat the reasons making necessary the creation of such a department, nor requisite that further argument should be adduced in support. Such reasons and argument have been presented and their truth and justice have been acceded to by thousands of mining men all over the country, who know that such legislation as that asked for is a present necessity.

Chairman Thos. J. Barbour, of the committee on dredging and jetties, presented a detailed report of the operation of gold dredgers in California, giving considerable information of a commercial and technical nature. The report stated that at the present time twenty dredgers are operating in California, producing in the neighborhood of $1,000,000 per year, and no doubt the coming year will show a large advance in the production.

An invitation from the Union Iron Works to visit that establishment and placing a tug at the disposal of the delegates was accepted.

L. C. Crane, prest. Petroleum Miners' Association, addressed the convention and said:

"Our industry is a large integral part of the mining industry. The value of the petroleum industry to the State of California cannot be estimated by any one living man. Petroleum is the basis of our coming industries. As an experiment, recently in England, a steamer was propelled 10,000 miles with petroleum. Petroleum costs more in England than coal, but it costs 70% less to handle it. California faces a new era and that new era depends upon the miner. It will not be very many years before the smokestacks of our industries will rear their heads all along the Pacific coast.

"When petroleum was discovered here a few years ago there were many Californians who doubted the utility of the crude oil, but now they are all alive to the situation.

"Fully $34,000,000 has been invested in lands, machinery and all that goes to make up the outfit for the production of oil. That capital has come largely from the East. The California oil industry represents to-day a capital of $116,000,000. We have inquiries from all over Europe. There are 2000 oil companies in California. The capital is bound to flow in. We want the co-operation of our gold miners. We are one brotherhood—a fraternity for the common good of California."

W. L. Watts made a report regarding the oil industry: The records show that the production of petroleum in California has increased from about 12,000 barrels in 1876 to nearly 2,500,000 barrels in 1899, and the production for 1900 will be larger.

When he made his report on petroleum in 1896, there were about 550 producing wells, and about 100 prospect wells had been drilled. At the date at which he closed his report, August, 1900, there were about 1500 producing wells and 470 prospect wells, and there is every reason to expect that the petroleum industry in California will go on increasing in extent and importance.

L. E. Aubrey discussed freight rates. Under existing circumstances, ore is charged for under a rate schedule dated September 15, 1899, at the rate of $100 per ton, a rebate to be made on the showing by the report of the smelting works that it was lower than the $100 rate called for, an exemplification of the theory of "all the traffic will bear." Under the schedule, a man might ship ore he valued at $50 a ton on a supposed rate of $5 a ton, but when the assay at the smelter showed a value of $75 a ton he would find he had to pay $2.50 per ton more. There would be some reason if the rate was made contingent upon the valuation of the ore by the owner, for then in case of loss the shipper could only regain the value he had placed upon it. There is a theory that a shipper can recover full value regardless of what his first valuation might be, but there had never been known a case where a man might recover more than the valuation he placed upon his own shipment even if he recovered that.

A resolution asking that the fixing of the rates on ore be brought to the attention of the Interstate Commerce Commission was referred to the committee on resolution, as were other resolutions proffered.

Chairman Caminetti of the committee on dams and debris, read the report, which went into the subject at great length. He discussed the preliminary barrier plan of the California Debris Commission illustrated and described in the issue of June 23, 1900.

The River and Harbor Act of 1900 contained authority to proceed at once with the construction of the works, thus giving Congressional sanction to the scheme.

The commission went to work at once with all preliminaries, and has continued energetically to press them to an early conclusion in order to proceed with the actual construction of restraining barriers and settling basins.

Owners of land covered by the proposed site have been brought together and all rights and lands required, with a few exceptions, have been secured. The commission is now in a fair way of obtaining about 3400 acres for site purposes within the limits of the appropriation.

The estimates of the commission fix the aggregate of cost of the completed works at $800,000, $500,000 of which has been appropriated in equal amounts by the Federal and our State governments. Plans for the works have been prepared by that commission, submitted to and approved by the Secretary of War, and now in turn transferred to the jurisdiction of the State in order to secure approval thereof, so that the appropriation made in that behalf by California may become available.

In order to fully provide for the completion of the system contemplated it will be necessary to secure an additional appropriation of $300,000, one-half from the National Government and the other from the State. The report recommends that the Association use its utmost endeavors toward securing the quota required from the State of California at the ensuing session of the Legislature, and that a special committee be appointed by the president to wait upon the Legislature and present the wishes of the Association in that respect, and report further recommends that the Association also request favorable action by Congress, and that Senators and Representatives in Congress be requested to use all honorable means to secure the appropriation of the sum of $150,000 for this purpose.

The report and supplemental remarks by Chairman Caminetti elicited considerable vigorous discussion of the whole subject from the standpoint of the miner, in which was outlined a plan to further test the constitutionality of the Act and to curb the course of the Anti-Debris Association.

O. S. Breese of Los Angeles read a paper on "Mining in Southern California."

When the convention reassembled on the third day, the 21st, the first business was the report of the committee on resolutions; but the committee not being in immediate readiness, President Ralston took occasion to refer briefly to the action of the anti-debris meeting at Sacramento the day previous as corroborative of his assertions concerning that matter in his address wherein he charged that Association with evasion and want of faith.

At the opening of the afternoon session E. C. Voorheis, chairman of the committee on resolutions, made the following report:

WHEREAS, The California Miners' Association was organized, primarily, for the purpose of devising a method whereby the great industry of hydraulic mining could be resumed without injury to the agricultural and other interests; and

Whereas, Since that time the mining interest has broadened by the development of the copper and petroleum mining industries to such an extent that it covers practically the whole State; and

Whereas, We recognize in the Petroleum Miners' Association an ally of great importance in the development of the mineral resources of the State; therefore, be it

Resolved, That we welcome into the fullest fellowship our fellow miners who are doing so much to develop the petroleum mining industry of the State, and pledge to them our heartiest co-operation and support in every measure in which we may be of service to them.

Resolved, That we highly appreciate the efforts made by the National Congress and the Legislature of the State to secure the passage by each of those bodies of that measure known as the California Mineral Lands bill; that we urgently urge upon the Congress of the United States that such efforts may be continued at its coming session, to the end that the California Mineral Lands bill may become the law of the land, and be the means of preventing further absorption by corporate interests of of land of great value to the prospector and the miner.

WHEREAS, Opposition to the efforts of certain of our fellow miners to operate their hydraulic mines under the Caminetti law has been made in the courts of the State, and more suits of a further character are threatened; and

Whereas, Where the injunctions obtained in the cases already brought were under a ruling by the court that the licenses in these particular cases were not regularly issued, the constitutionality of the law has been challenged; now, therefore, be it

Resolved, That the executive committee of the California Miners' Association shall determine the constitutionality of said law in the courts of last resort by defending a test case brought against a miner holding a regularly issued license by the California Debris Commission.

Resolved, That we heartily favor the amendment of Sections 2319, 2320 and 2324 of the Revised Statutes of the United States, concerning the location of mining claims, so that the locator shall be accorded a reasonable time within which to finally mark his surface boundaries on the ground, so that all local rules, regulations and customs of miners and all State and Territorial laws on the location of mining claims shall be abolished, and so that, while liberal provision shall be made for the protection of the locator who holds and works his claim in good faith, the law concerning annual assessment shall most effectually check the present injurious practice of holding mining claims year after year without development.

E. C. Voorhies, President California State Miners' Association.

Resolved, That in the problem of remedying the criminal abuses of the land and mining laws of the nation by the wholesale attempts to secure as agricultural lands, by the use of so-called scrip and otherwise, great tracts of the public domain that are unquestionably mineral in character, and which are recognized as mineral by the the people who seek to secure them as such by subterfuge, legal technicalities and outright perjury, the petroleum industry faces the matter of most serious present concern to it in its relation to the Federal laws and their administration. We believe that this problem is peculiarly one in which the whole mining industry of the State is interested, together with the petroleum miners, and we solemnly pledge our highest endeavors to protect the heritage of the miner in the public domain in accordance with the letter and spirit of the beneficent laws which were intended by Congress to sacredly preserve the vast mineral resources of the public domain to the mining industry, that their development might be encouraged and fostered. We distinctly favor the proposition that where a contest takes place between a scripper and a miner in any department of the United States Land Office the burden of proof shall be placed upon the scripper and not on the miner.

Resolved, That one of the most important and feasible remedies for the said abuses of the rights of the oil miner on the public domain would be found in the law unsuccessfully proposed to Congress during its last session, by which the location of petroleum placer claims was sought to be so regulated as to secure to the miner an opportunity to make technical "discovery" of mineral substances as a precedent to location, in accordance with law. A measure of this nature is demanded by the peculiar conditions of the petroleum industry; would be but a measure of simple justice necessary to give effect to the spirit and intent of the mining law; would be but a wise adaptation to the oil industry of the tunnel-site law, and would work no injury or inconvenience to any legitimate interest. And that we heartily recommend the passage of the proposed Act of Congress recommended by the executive committee of the California Miners' Association, and by the Petroleum Miners' Co-operative Association, being Senate bill 3326, now pending before Congress, and earnestly urge our Senators and Representatives in Congress to use all honorable means to secure the passage thereof.

Resolved, That in the opinion of this body the geological conditions attending oil mining and the multiplication of wells which penetrate water-yielding strata and release their stores of water, make wise and timely investigation of the alleged injuries done to the oil wells and oil fields by the flooding of porous oil-yielding strata from such induced flows of water. We note the fact that the laws of certain Eastern States recognize the injury to oil interests caused in this way and require the casing of water-yielding wells in oil regions and the effective plugging of abandoned wells.

Resolved, That we heartily favor State legislation relative to the needs of the petroleum industry, and it is suggested that one important matter is that of the regulation of mining rights on lands controlled by the State, including tide lands, the bed of the ocean to the 3-mile limit, and the beds of the streams, all mining operations in such ground being now conducted by the simple sufferance of the State and the only mining rights obtainable being those based on possession.

Resolved, That in the judgment of this Association the mining industry of this country, with its output of raw material exceeding a billion dollars in annual value, its tremendous significance to the industrial prosperity of the Nation and its still more splendid promise for the future, warrants and demands the governmental protection and assistance that can be adequately extended only through a Cabinet department of the executive branch of the Government. We therefore heartily endorse the now national demand for a Cabinet department of mines and mining, and invite other organizations to join with this Association in the effort to secure the creation of such a department.

Resolved, We deem it the duty of this convention to place itself on record in favor of liberal encouragement and protection to all legitimate mining interests and pledge ourselves to assist in every reasonable manner any and all legislation, State or national, which is calculated to remedy existing wrongs. We recognize the gross injustice of permitting that class of land pirates, which by claiming land to be suited for agricultural purposes that is manifestly and essentially unfit for any uses except mining, to attempt to wrest from purchasers of State lands their recognized equitable rights, and through perjury and distorted interpretation of the land laws of the State, to place serious obstacles in the way of large investments of money and important oil developments.

Resolved, We look forward with pardonable pride to the early construction, already assured, of the restraining barriers for which $500,000 have been appropriated by our State and National Governments. We heartily approve the plans and recommendations of the California Debris Commission for the construction of such restraining barriers, as outlined in their official report of 1899 to the Secretary of War, and we hereby instruct our committee upon legislation to use all honorable means to secure such added legislation and appropriation as may be necessary on the part of the State and National Governments to carry such work to a final and successful completion.

WHEREAS, The great mineral wealth of the State is increasing from year to year, and greater demands are made upon the State Mining Bureau; therefore be it

Resolved, That we recognize the fact that the future development of the State depends in a large measure upon the future development of its water resources and the preservation of its forests; therefore, we favor the immediate and thorough investigation of, and report on our water resources and the best methods of improving and developing the same; the collaboration of the Federal and State Governments in such investigations; and the proper appropriations therefor by our State Legislature. We desire, and urge upon the Federal Government, that all public forests be reserved from sale, and the establishment of a forest patrol, and we favor the enactment by the State Legislature of such penal laws as will lessen the danger from forest fires.

Resolved, That this Association again express its deep satisfaction at the justice of the policy and action of the Commissioner of the General Land Office, Binger Hermann, in his suspension from agricultural entry of a large area of probable oil lands in this State pending an impartial investigation of their mineral or non-mineral character, thereby preserving to the oil miners the mining rights which are theirs by both the letter and the spirit of the laws.

Resolved, That this Association holds itself greatly indebted to the public press of San Francisco and the mining counties for the assistance it has given not only to the Association, but to the mining industry of California during the past year.

Resolved, That this Association is under deep obligations to the merchants, manufacturers and business men of San Francisco for their generous financial aid during the past and previous years, and recognizes the fact that without this special assistance it would have been unable to accomplish one-half of what has been done. The Association is free to acknowledge this, since the largest proportion of the funds received has come from these gentlemen, who are only indirectly interested in the mining industry.

The report was taken up, seriatim, and adopted section by section as above.

The committee on revision of the constitution and by-laws reported as follows:

Your committee on revision of constitution and by-laws of the California Miners' Association recommend the following amendments to said constitution and by-laws: Amend Section 2 of Article 1 of the constitution to read as follows: Section 2. The objects of this Association shall be to protect, develop and foster the mining and mineral industries of the State of California in all its branches.

Amend Section 1 of Article 2 of the constitution to read as follows:

Section 1. The officers of this organization shall be a president, two vice-presidents, secretary, assistant secretary and treasurer, and an executive committee consisting of not less than fifteen members selected at large, and two additional members from each county represented in the Association, to be selected by the president of this Association.

Amend Section 2 of Article 3 of the constitution to read as follows in the last paragraph:

In the absence of the president, one of the vice-presidents shall perform the duties of that office.

Amend Section 6 of Article 3 of the constitution as follows: Section 6. All checks and drafts of this Association must be drawn by the secretary and signed by the president and secretary.

Amend Section 2 of Article 4 of the constitution to read as follows:

Section 2. It shall be the duty of the executive committee of this Association to promote the formation of branch organizations in all counties where mines or minerals constitute one of the important industries. Such organizations shall be recognized as branches of this Association.

Amend Section 4 of Article 4 of the constitution by eliminating the clause: "All individual members of the Association in counties abutting on San Francisco bay, $5 per annum."

All other sections of the constitution and all sections of the by-laws to remain unchanged.

The report was adopted as read.

Col. W. H. H. Heuer, U. S. Corps of Engineers, and senior member of the Cal. Debris Commission, in response to invitation, took the platform and said:

"The question most frequently on the lips of the miners is, 'Where is that $500,000 appropriated for the dams?' I'll tell you. There has not been one cent drawn from it. The State has spent nothing for the preliminary work. You'll get your dams and they'll impound debris; and while I don't say they will allow the resumption of hydraulic mining, I do believe that they will prove so effective that in time you can turn your mines loose."

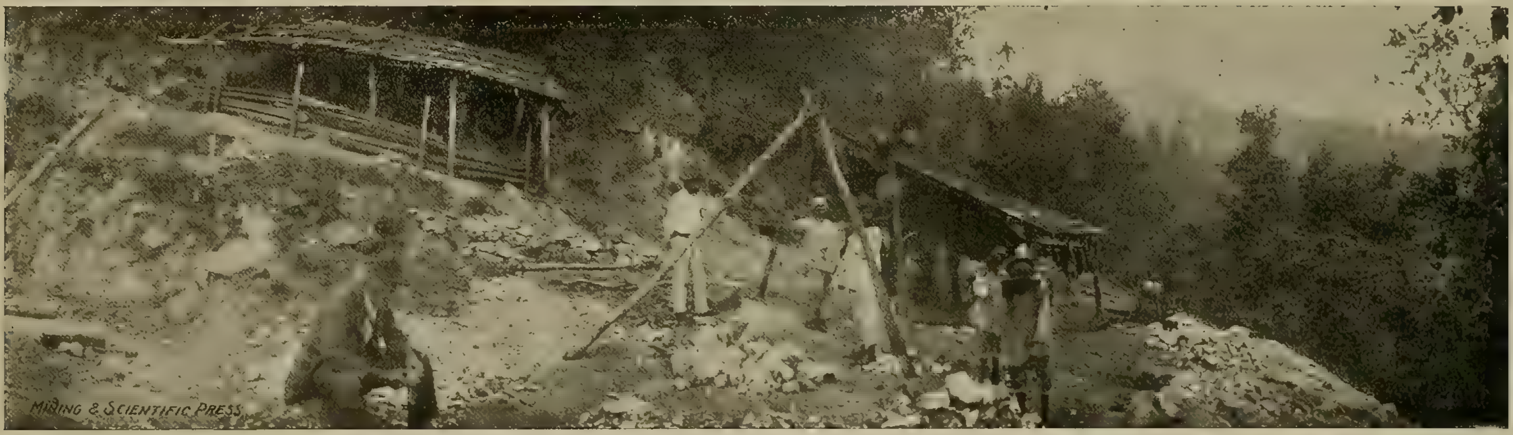
The election of officers for the ensuing year was next in order. E. C. Voorhies of Amador county was unanimously elected president, Fred Zeitler of Nevada county and Lew E. Aubrey of Los Angeles county were, by acclamation, elected first and second vice-presidents, respectively, and, in an equally unanimous way, E. H. Benjamin of Alameda county was re-elected secretary and Sam'l J. Hendy of San Francisco was re-elected treasurer. As all the officers are serving without salary or emolument of any kind, and as the position of secretaryship involves considerable expense, a motion unanimously prevailed that the Executive Committee of the Association hereafter provide "a liberal salary" for the secretary.

After the customary votes of thanks, the convention adjourned sine die.

Taviche, Ocotlan District, Oaxaca, Mexico.

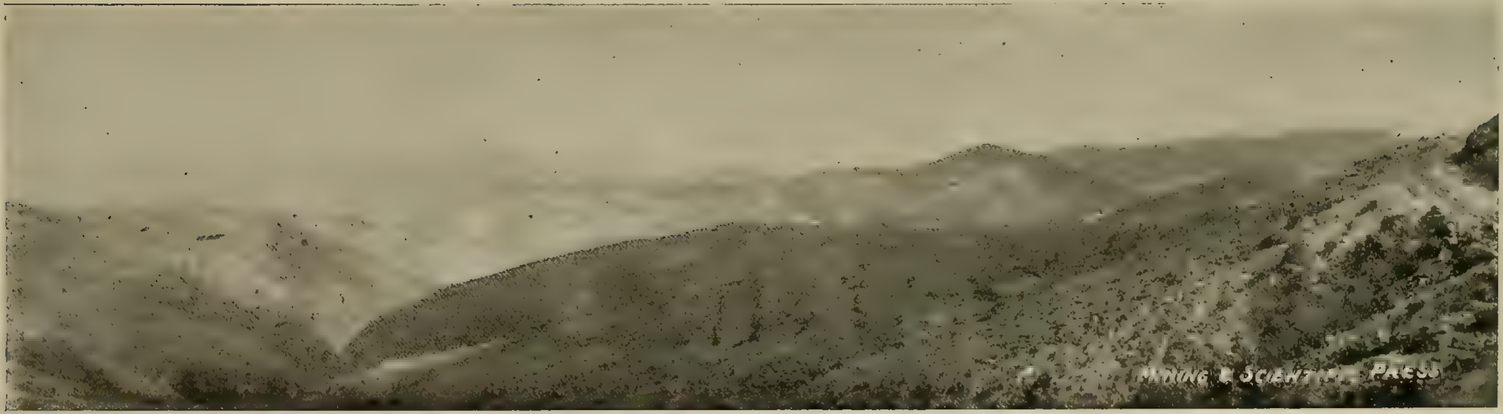
Written for the MINING AND SCIENTIFIC PRESS.

Mexico is a land of mystery and romance, with creeds and civilizations more ancient, with ruins more wonderful, with manners and customs more strange, with soil and climate more rich and varied, than any portion of these United States, and yet there is less known about our next door neighbor than of foreign lands we must cross the broad Atlantic to see. This is true of the vast majority of people. Tourists and sight-seers will traverse half the globe in search of something new or strange in the old world, while sights more wonderful lie right at their door and can be reached in a Pullman car.



Mouth of Entrance to Six-Mile Tunnel, Taviche District; (Blind Boy Miners in Right Foreground.)

General View of Mill and House, Zeboletta Mine, Oaxaca, Mexico.



General View of Taviche District, Oaxaca, Mexico.

To the tourist everything is new and strange—the people, their manners, customs, social life, business habits, religion and superstitions. In all of these Mexico differs from every other country in the world. The first view of the City of Mexico surpasses any other city on the continent of America. Nestled in a valley of exceeding beauty, it gleams like a jewel in its setting of silvery lakes and dark-green hills. The belfries and towers of its hundred churches and palaces are mirrored against a sky that baffles all description. It was this sight that inspired the feelings of awe and admiration in the bosom of Cortez as he stood with his little band of adventurers upon the crest of one of the surrounding hills and looked down upon the capital of the Montezumas for the first time. The sight is truly inspiring, and all tourists are profuse in their exclamations of its grandeur. Mexico City, with all its relics of a past civilization, never fails to fascinate the student of history and fill the mind of the casual observer with wonder.

Mexico is a rich mineral country, and has yielded nearly two-thirds of the silver that forms the stock of the white metal of the world.

For years a syndicate has held a concession on a tract of rich mineral land 35 miles square in the district of Taviche, Ocotlan, Oaxaca, and not having complied with the requirements of the concession the Government took possession and threw the same open to the world for denouncement—that is, for settlement, as was Oklahoma, or the Colville reservation last month. No rush was made, as was the case at Oklahoma or Washington; but few went in.

Some of the properties are reported valuable. Of the Benjamine, owned and operated by the Teressa Co., J. B. Powell of Toronto, Canada, says: "I found at the bottom of its lowest workings, about 470 feet deep, a body of ore between two walls 14 feet wide, 16 inches of this vein being a rich hilo. A choice sample gave an assay of 13,077 ounces silver and 11¾ ounces gold per ton. The whole of this hilo of 16 inches wide would assay 1500 ounces silver and 6 ounces gold per ton. This, of course, was an extraordinary result, but the average sample of this 14-foot vein gave 176 ounces silver and 2⅞ ounces gold per ton."

The La Squadra adjoins the Benjamine and is owned and operated by Senor Don Von Baights.

The Zapote mine, owned and operated by Mr. Wallace, has proven a good property. He has taken out ore ranging from 300 to 800 ounces silver per ton and the usual pro rata of gold.

The El Conejo, the El Mojura, the San Antonio, owned and operated by a company of which A. Fous is manager, are yielding handsome returns.

The camp is well situated. To-day it is 35 miles from a railroad, but by January, 1901, the extension of the Mexican Southern Railroad to Ocotlan will bring it within 12 miles of railroad facilities. From Ocotlan the main road will be extended to Ejutla.

The Los Paras mines, owned and operated by Senor Garcia, lie west of the Taviche camp about 30 miles. This is one of the famous mines of Oaxaca. Some illustrations are given herewith of this region, on this page and the front page.

There are fourteen veins now opened, connected by tunnels and incline shafts, over 6 miles in length. The ore from these mines yields from 2 to 8 ounces gold per ton.

The affairs of this company are conducted on purely Mexican methods. The ore is carried out of the mine on the backs of boys. One of the wonders is that some of these boys are stone blind, but with unerring instinct they will find the drifts, secure the ore, carry it out on their backs and deposit it in its proper place, then return and repeat the process all day without a mistake. They can pilot one to any part of the mine he wishes to find. Eight miles from Taviche is the St. Martine district, where Boss & Armstrong have a mine, in which at a depth of 50 feet was found ore running 1700 ounces silver per ton, besides considerable gold.

Some of the old properties have yielded considerable amounts to their owners. There are about twenty-five other mines being worked in the district mentioned, all of which, a greater or less extent, are paying their owners.

Oil Fields of Fresno County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by H. G. PARSONS.

COALINGA DISTRICT.—The oil-bearing territory in the neighborhood of Coalinga, Fresno county, has been partially defined for many years. In a monograph written by Prof. W. L. Watts, assistant State Mineralogist, and published in 1894, the topography and geology of the entire district were described with some minuteness. At that time several shallow wells had been previously sunk, and a few of these wells were producing limited quantities of petroleum. Recent developments prove that this oil production was merely a seepage from the oil-bearing strata lying far beneath the bottom of the deepest of these wells. In 1898 the attention of C. A. Canfield, who had previously been instrumental in oil development at Los Angeles and elsewhere, was centered on the district 9 miles north of Coalinga. The experience of others at this point had been disappointing, rather than encouraging. But Mr. Canfield seemed imbued with the idea that this could be made a productive district. Enlisting the financial aid of Mr. Chanslor of Los Angeles, he proceeded to sink a well. He went down deeper than any of his predecessors, and on the third trial he struck a "spouter." This was the basis of Messrs. Canfield & Chanslor's wealth, as it was the beginning of the oil excitement and activity in the San Joaquin valley, which has increased from that day to this. The gentlemen named continued to sink wells in close proximity to their successful venture, and in nearly every case they secured another producing well. Other companies came in and they, too, obtained oil in profitable quantities. The Coalinga district became famed over the entire country. It is still one of the most productive fields for its size in the State, and its shipments are undiminished.

The S. P. Railroad Co. built a branch line west from Goshen to Alcalde several years ago. This was done to reach certain coal measures in the same range of hills that are now producing oil. The coal was bituminous in character, and was found upon practical test to be too soft for profitable use. There is no doubt that the genesis of this coal is closely allied to the petroleum deposits which have since been tapped. The railroad from Huron westward was fast becoming a piece of unproductive property. It would probably have been abandoned and the track pulled up if petroleum had not been discovered at about the time it was. The railroad has proven a great boon to the oil industry at Coalinga. It afforded an instant market by transporting the oil to the center of manufacturing industry. The Coalinga oil, like that which has since been discovered in other parts of the San Joaquin valley, is a fuel product, with an asphaltum base. It is decidedly popular as a substitute for coal in steam production. There is also a growing demand for this oil from manufacturers of illuminating gas. There is almost no waste when it is used for this purpose.

Soon after oil was discovered in paying quantities at Oil City, which was the name given to the cluster of buildings which sprang up around Messrs. Canfield & Chanslor's wells, the Union Oil Co. of San Francisco provided tankage facilities in the field and laid a pipe line 9 miles in length to the railroad track. Their charge for storing the oil and piping it to the tank cars is 10 cents per barrel. It is needless to say that the line has proven a profitable bit of property. It has probably paid for itself several times over. The Coalinga Oil Co. (stock in which is largely owned by Canfield & Chanslor) constructed a 30,000-barrel tank some distance from the oil field about one year ago, and connected the tank by a pipe line with their wells, but they have never yet connected the tank with the Union Oil Co.'s pipe line, nor have they laid an independent line to the railroad track. Thus the only purpose served by the Coalinga Co.'s tank is that of a reservoir for any surplus oil which could not be handled by the Union Oil Co. There has been no occasion to use it for this purpose as yet. At the time of the writer's visit to Coalinga, however, the Home Oil Co. had not been shipping for nearly a month, and the Union Oil Co.'s tanks were nearly full. Had the Home Co. not made arrangements to ship soon thereafter, the Coalinga Co.'s tank would have proven a great utility. The Union Oil Co. has also laid a pipe line to a new portion of the Coalinga field, on Section 28, where several wells have recently added to the production of the district.

The water question is usually a serious question in the central California oil fields. Artesian water—often struck in these regions instead of oil—usually carries in solution so much salt, sulphur or other minerals as to make it unpalatable for drinking purposes, as well as undesirable for use in boilers for the generation of steam. At Oil City the water question has been met in a tolerably satisfactory manner by the Coalinga Water Co. This corporation has a pumping station on the plains, 3 miles from Coalinga and 6 miles from Oil City. Water is pumped from two wells, each 300 feet deep, and it is thence forced into tanks on the top of a high range of hills, 5 miles distant and 1180 feet above the pumping station. From here it flows by gravity to the boilers of the oil companies at Oil City and to Section 28. This water is not the best for domestic purposes, and many families own small stills, with which they procure distilled water. Stock drink the water freely, and it is used unchanged in the boilers, where it incrusts the flues in a short period. Another company has developed a purer, but more limited, water supply in one of the canyons west of Oil City.

The Coalinga Oil Co., largely the property of Canfield & Chanslor, as before stated, is the largest producer in the Coalinga field. This company has at least a dozen productive wells, one of which is a copious flower at this date, considerably more than a year since it was sunk. The Canfield & Chanslor Co. is closely allied to the Coalinga Co. Each of these companies is now drilling a new well, showing that development has not ceased on Section 20, where the original discovery was made. The pumps at several wells are run from one jack, centrally located. The fuel used on Section 20 is gas that is obtained in conjunction with the oil. As oil is drawn out of the wells, a considerable amount of gas is liberated. This is conducted by pipe lines to retorts in various parts of the field, and is thence drawn to the boilers as needed. Thus the pumping arrangements are almost entirely automatic. An engineer, to attend to the water supply in boilers or to overlook the gas engines stationed here and there, is the only employe needed for this part of the work. The arrangement is decidedly economical.

The Home Oil Co., in which Canfield & Chanslor were once largely interested, but from which they retired by sale of their stock more than a year ago, is the second largest producer in the Coalinga district. They have five producing wells, from only one of which the oil is pumped; the others are flowing wells. One of these is the famous Blue Goose, or Well No. 3, which started to flow over a year ago at the rate of 1100 barrels per day. It finally settled down to 200 barrels per day, which is its present production. The other wells started to flow at the rate of 400 barrels per day, and they, too, settled down to a much lower rate of production. The total production of the Home Oil Co. is said to be about 15,000 barrels per month. The company is now drilling wells Nos. 6 and 7. They have just completed a steel tank of 30,000 barrels capacity.

The Blue Goose Oil Co., which has a well on Section 20, not far from its celebrated namesake, is still drifting and is down over 2000 feet without striking oil. They are greatly embrrassed with water, as it comes in almost as fast as it can be pumped out. They have one of the finest holes in the camp, with 7⅝-inch casing from top to bottom. Oil is the one thing needful to make a fine well.

The experience of this company is no more unfortunate than that of several other concerns which began operations quite close to the Chanslor & Canfield and the Home gushers. They put down holes to a depth of 1000 to 2000 feet, but found no oil. Apparently under part of Section 20, 19–15, there is a pool of petroleum. If the field extends continuously to the northwest or west, as was thought at first, this fact must yet be demonstrated. The field seems certainly to extend to the southeast, or, at any rate, another pool exists under Section 28, where the greatest activity in development work is now apparent.

The Hanford Oil Co. own all of Section 28, but they are themselves drilling only one well. They have three-fourths of the section leased to other companies. The Independence Oil Co., lessee of the S.W. ¼ of the N.E. ¼ of Section 28, has three producing wells, while Well No. 4 is in oil sand. This was struck at 730 feet and is 50 to 60 feet thick. The Twenty-eight Oil Co., lessee of three-fourths of the N.E. ¼ of Section 28 has two finished wells, which will be producing as soon as a pumping jack can be rigged; a third well is being drilled. The oil sand in these wells is 100 feet thick. The Oil City Petroleum Co., lessee of 240 acres on Section 28, has three producing wells, averaging sixty to seventy barrels per day each. Well No. 4 is about finished. The oil sand is struck at 730 feet; well is finished in clay at 900 feet. The Rock Oil Co., lessee of the W. ½ of the S.W. ¼ of Section 28, is just finishing its first well. It will thus be seen that Section 28 is proving promising and productive territory. These wells are sunk on the sides of a spur of hills, running southwest from the main range, and they are nearer the valley than the wells on Section 28.

The Confidence Oil Co., which owns Section 25, 19–14, where they have a well in the oil sand at 775 feet, are about to insert a pump. The Wisconsin Oil Co. is drilling on Section 32. The Minnesota Oil Co., on Section 33, spoiled their first hole, and they are now drilling a second hole, with good indications of oil. This is still nearer the foothills than Section 28. The Investment Oil Co., on Section 16, 19–15, is now down 1900 feet, but have found no oil sand as yet.

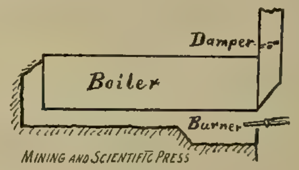
Considerable activity is expected in the newer part of the Coalinga district, on Sections 28, 33, etc., the coming winter.

GREGOR BLANCK, a Hungarian, has invented a loud-speaking telephone, and by the aid of a powerful inductive coil has succeeded in telephoning over a distance of 1000 miles. The crux of the invention is that, by means of the coil, articulation of the speaker is intensified as the words pass along the wire. Besides connecting the instrument with the telephone, the inventor will attach it to the electrophone, and by this means one will be able to sit in a room and listen to what is happening in a theater without having to insert the tubes into the ear, as is now necessary. The sounds would proceed from the electrophone in much the same manner as they are recited by the phonograph.

Experimental Burning of Oil.

TO THE EDITOR:—Following is an account and some figures in regard to an attempt to burn oil, which may be of interest to anyone interested in obtaining cheap fuel—for, although our effort failed, we often learn as much through our mistakes and failures as we do through our successes. We are located in a place where wood costs $5 per cord, and, wishing to reduce the expense of working an old dump, which involves but the question of cheap fuel to make it profitable, we concluded to try burning oil.

Our attempt to burn oil proved more expensive than burning wood, oil being laid down at the mill at a total expense of $3 per barrel. We burned 1⅓ cords of wood per twenty-four hours, and calculations based on information collected before attempting to burn oil led to the belief that oil was cheaper. We are all green in regard to burning oil, and perhaps the conditions under which we burned it are not calculated to give the best results. We installed the oil battery under the direction of a man from Los Angeles, which consists of an oil tank 6 feet in diameter by 30 inches high, from which runs a pipe conveying the oil through a heater, heated by exhaust steam, to the burner. The oil burned well with steady flame and no smoke when using a certain amount of oil, and a certain amount of steam to blow with; but, if more steam was used, it would burn unsteadily, with occasional small explosions, something like a sudden back draft. The arrangement of the furnace is like the enclosed sketch:



We managed to keep steam between seventy and eighty pounds, but found it no easy matter to do so without constant attention to the burner, and the consumption of oil was such as to make it much more expensive than wood. Notwithstanding our failure to economically burn oil, we are in hopes to reduce the amount of oil consumed, and would be glad to hear of any improvements that we could make to reduce the consumption of oil.

Following are the figures, conditions, etc., noted during a run of 11¾ hours. We used three different burners during the run and measured the oil every hour as it lowered in the tank:

First burner—Run, 5 hours; burned, 2½ inches oil. Second burner—Run, 5 hours 45 minutes; burned, 2¼ inches oil. Third burner—Run, 1 hour; burned, ⅜ inch oil. Total run, 11¾ hours; total burned, 5⅛ inches oil.

5⅛ inches = 20,866.50 cubic inches in 11¾ hours.
At 231 cubic inches to gallon, makes 90.32 gallons.
Oil per hour for four stamps, 7.686 gallons.
Oil per hour for one stamp, 1.921 gallons.
Boiler, 30 inches by 8 feet.
Engine cylinder, 5″ x 8″.
Four stamps, 850 pounds.
Speed of engine, 350 revolutions per minute.
Number of drops per minute, 100; 5-inch drop.
Feed water for boiler, injector.
Flame shot direct; no larger.

We would be glad to learn if conditions could be in any way improved.

H. T. SEDGLEY.

Weldon, Kern county, Cal.

How Fires Are Started.

The Railway Review has collected some curious examples of the way in which fires may be caused. In one instance, where some waste, which had been used with mineral oil, had been thrown into a safe place, an insect crawled through it, and then, carrying some pieces of the oily fiber sticking to his body, made his way to a gas jet. The cotton fibers which adhered to him caught fire, and he dropped, blazing, to the floor, setting the building on fire. In another case a quantity of waste was supposed to have been ignited by an electric spark which passed from a belt running close to it to some conducting substance through the cotton, which it ignited on its way, as sparks of frictional electricity can very easily do. In two cases destructive fires are said to have been caused by water. In one of these a flood caused the water to rise high enough in a factory to reach a pile of iron filings. The filings, on contact with the water, oxidized so rapidly that they became intensely heated, and then set fire to the neighboring woodwork, and the building was destroyed. In the other case the water from the engines, during a fire, found its way into a shed containing quicklime, and the heat generated by the slacking of the lime set fire to the shed, and this to other buildings.

Oil and Gas Yielding Formations of California.

W. L. Watts has completed his bulletin on the above subject, and in a short time it will be issued by the California State Printing Office under the auspices of the Mining Bureau. The scientific standing of Mr. Watts gives value to his views from an impartial and expert standpoint. Through his courtesy we are enabled to publish some of the salient points, that the information contained therein may have wide and immediate circulation among those most interested.

In the bulletin he will cite the geological formations in the San Joaquin valley, in the course of his observations saying that "the Neocene formations on the eastern side of the valley are much less disturbed than those on the western side. On the eastern side they are usually inclined at a very slight angle, generally less than 15°, while on the western side the inclination is seldom less than 20°, and sometimes as high as 70°. The reason of this is that the earth movement which so greatly disturbed the rocks of the coast ranges at the close of the Neocene period affected but slightly the Neocene formations in the foothills of the Sierras. The development of the remunerative oil field at Kern river, on the eastern side of the San Joaquin valley, where the formations are so slightly disturbed, warrants the assumption that other localities may be found where oil-yielding rocks which have been subjected to but very little disturbance form a wide and extensive oil line. The place to look for such conditions is on the east side of the San Joaquin valley. A great drawback to prospecting in the lowermost foothills of the San Joaquin valley is alluvium, which to a great extent covers the Neocene formations. It is also possible that comparatively undisturbed Neocene formations may be found in the foothills of the Sierras to the south of the Tehachapi pass."

Discussing the Kern river oil field Mr. Watts says: "The Kern river oil field, as far as it has been developed, comprises an area of about 12 square miles, and is situated in T. 28 S., R. 27 and 28 E., and partly in T. 29 S., R. 28 E., M. D. M. Within this area in August, 1900, about 130 wells had been drilled and many others had been commenced. These wells are drilled in groups and some of the groups are nearly a mile apart. The depth of these wells varies from 450 feet to more than 1000 feet. The formation penetrated is, first, alluvium or drift, which in few places exceeds 50 feet in thickness; then a stratum of blue clay from 25 feet to 350 feet thick; beneath the blue clay is a water sand from 10 feet to 100 feet in thickness; beneath the water sand the formation consists of alternate strata of clay and sand. The well records show that most of these sands contain oil, and that in some instances they aggregate a thickness of more than 300 feet.

"It is a difficult matter to estimate the thickness of oil-sand strata in a well which is yielding oil, especially when the formation is caving; but some of the operators in the Kern river field state that they have estimated the thickness of the oil-sand in their wells by carefully casing off all the strata as they went down, and that they found the oil-sand to be more than 300 feet in thickness. It is unlikely that the oil sands in the Kern river oil field will prove of uniform thickness or uniformly saturated with petroleum; but the development at this date indicates that the Kern river oil field is the largest developed oil field in California.

"The owners of the wells in the Kern river fields state that their wells will produce from 40 barrels to more than 100 barrels of oil a day. Owing to lack of transportation, there has not been a sufficiently continuous production to warrant a definite statement by the writer as to the yield of the wells in this field. The oil is a black oil, and it is said to have a gravity of from 14° to 17° B. Much running sand accompanies the oil. Some companies separate the sand from the oil by running both into a slump-hole, where the sand settles; the oil is then pumped from the surface. Other operators pump the oil and sand into flumes furnished with riffles, which are from 4 to 8 inches in height. The flumes are from 80 to 300 feet in length, and the riffles are from 8 to 14 feet apart, according to the grade of the flume. In some instances the oil is of such gravity that it has to be steamed in the well before it can be pumped. In a general way, it may be said that there is very little gas in the Kern river oil field, although, in some instances, it is claimed that enough gas could be collected to supply fuel for steam purposes. The gas appears to be held in solution in the oil and separates from it when brought to the surface.

"There are very few rock exposures in the Kern river oil field. These show strata of clay and soft sandstone. The sandstone is light-colored and formed principally of granitic material. These rocks resemble the formations which may be seen resting on the granite a few miles northeast of the oil field.

"Between the oil field and the granite, the sandstone contains fossils which identify the formation as the Middle Neocene. The best rock exposures seen in the oil fields are on the bank of Kern river in Sec. 2, T. 29 S., R. 28 E., M. D. M. At this point, strata of sandstone, somewhat impregnated with petroleum, dip to the west of north at an angle of less than 10°. It is difficult to estimate the precise direction of the dip of the oil sand, even when the depth at which the oil sand was struck has been given. The reasons of this difficulty are: First, it is impossible to tell whether or not the first oil-yielding stratum is the same stratum; second, it is evident that the strata vary in thickness within a short distance; third, the angle of the dip is so slight that it is necessary to use the records of wells which are far apart for the purposes of calculation; fourth, there is every reason to believe that the strata penetrated in the Kern river oil field undulate.

"Notwithstanding the difficulties referred to, the writer collated the well records kindly furnished him by the well owners in this oil field. From these records it appears that in the northern portion of the field the strike of the oil sand is about N. 30° W., the dip being S. 60° W. at an angle of less than 10°; and in the southern portions of the field the strike is about N. 70° W., the dip being S. 20° W. at an angle of less than 10°. It is probable that N. 60° to 70° W. is the prevailing strike of the Neocene formations in the Kern River district.

"In August, 1900, when the Kern River district was visited by the writer, the Kern river might be said to bound the developed portion of the Kern river oil field on the south and east. The rock exposures on the banks of the river show no evidence of any fault or line of geological disturbance to which the course of the Kern river might be attributed; and the terraced banks of the river indicate a long period of gradual erosion. There is a reasonable probability, therefore, that remunerative oil-yielding formations will be discovered on the south side of Kern river."

(TO BE CONTINUED.)

The German Meinecke.

TO THE EDITOR:—In these days of economical mining, when engineers are searching, not for ores running thousands of dollars or hundreds of dollars to the ton, but seem to be rather devoting their time and attention to securing the last ten cents per ton from a large tonnage, a brief description and plans of a machine that has been in practical use for many years is in order, especially as this machine has been so thoroughly tried that it is no longer a theory but an actual condition, and is, in fact, a satisfactory, practicable, easily handled and correct piece of machinery. The machines in the Smuggler mill were imported from Germany, and have been in use by me for many years, and have been in use for a much longer period than this in the old country. Classification for size of the sands of any mill, it is generally conceded, is one of the most important branches of concentration, and one that requires more study and care than at first glance would seem that it would warrant. The importance of separating ore into sizes, however, before attempting to concentrate, either on jigs or tables, is so self evident that it hardly requires any special argument. The mere fact that a chunk of lead the size of a marble will not fall more quickly than a chunk of some kind of rocks as large as a crabapple, but that a piece of lead as large as a marble will fall more quickly than a piece of rock the same size, is about the only argument that this is needed. When rock gets so fine that it is practically impossible to size it by means of screens, owing to the fact that the smaller the hole in a screen the thinner the metal has to be in which these holes are punched or drilled, makes it necessary to size this ore in some other way. Of course we all understand that the hydraulic sizing cannot be as acceptable as screen sizing, and it is simply because it is impossible to screen size the ore that we try to get some other means of accomplishing the same object. This, as a rule, is done hydraulically on the German plan, for making this classification. It is easily adjustable, simple, and almost impossible to get out of order. It should immediately precede the spitztkasten or settling box. Of course, in all hydraulic sizing the great trouble is that the factor of weight, as well as size, enters very largely into the law of bodies falling through an upward current of water, and naturally any hydraulic classifier will, to a certain extent, effect a partial concentration in itself. A perfect sizer for the finest of slimes is yet to be invented or discovered. The most of the classifiers for size are based upon the principle of dropping the slimes through an upward current of water and drawing it off by a siphon as this one does. But the most of them, unfortunately, introduce water from an upward current each time that any one size is desired to be drawn off. For example, in drawing off one size, they introduce water at the bottom under pressure, and they go through the same process, adding more water in a different receptacle for getting another size. The objection to this is two-fold; first, it is extravagant in the use of water, and sometimes water is scarce, and secondly, such a flood of water is introduced into these slimes as to be a very great detriment. As a matter of fact, for the successful concentration of slimes, the less water above that absolutely necessary indroduced the better. The German meinecke has to a certain extent obviated this difficulty, by means of a pressure tank of clear water located at from 4 to 10 feet above it, thus introducing an upward current of water, at the pipe flange, and drawing off four different sizes of sands and meals, so that only one-fourth of the amount of water ordinarily used is necessary. Of course this machine could be built with as many siphons as would be required, but in practical use it would probably be more advisable to have more of them in use rather than to make each larger.

Aspen, Colo., Nov. 10. S. I. HALLETT.

Steam and Gas Engines.

A correct answer to the question, What is the comparative cost of operating a gas engine and a steam engine equal of power? involves a special solution for each individual problem. Considered solely as a machine for converting the total energy of the fuel into mechanical work, the gas engine is far more efficient. There are gas engines in operation which transform over 25% of the heat in the fuel into useful work, while in the best recorded performance of the steam engine barely 14% of the energy in the coal burned has been thus accounted for, and in the average steam plant, not to exceed 5%. There are many small plants, consisting of common slide engines, with uneconomical types of boilers, in which less than 2% of the energy of the coal burned is converted into mechanical work. At the same time it must be remembered that a given number of heat units in the form of fuel suitable for use in a gas engine costs more than an equal number in the shape of coal or other ordinary fuel suitable for burning in a common boiler furnace. As a general proposition it may be assumed that in a plant which operates continuously the item of fuel alone will be somewhat greater for the gas engine than for an improved type of modern steam engine, except possibly in the case of an engine running on producer gas. When the service is of an intermittent nature, or the power is required only for a comparatively short time each day, this difference in favor of the steam engine becomes less, and may become a balance in favor of the gas engine, for the reason that in the gas engine plant there are no stand-by losses, no radiation nor leakage when standing idle under full steam pressure, and coal being burned in banking fires and raising steam. With the gas engine the fuel expense starts and stops with the engine. But the fuel cost is only one item in the cost of producing power. One must consider the value of the additional space and buildings required for a boiler plant; the cost of a stack; depreciation, repairs and insurance on a boiler plant. The gas engine has a field of its own which cannot be occupied by the steam engine, and there is no immediate prospect of the gas engine encroaching on the legitimate field of the steam engine.

Referendum Dollars.

Joseph Lesher, a Victor, Colo., silver mine owner, has procured a die, laid in a supply of silver bullion, and has manufactured several silver coins, each containing one ounce of pure silver. He calls his coins "referendum dollars," because they are referred to the people for acceptance or rejection. His silver at the present quotation costs him 65 cents an ounce, and the expense of coining is 15 cents—80 cents in all. He values his dollars at $1.25 and expects to issue them as such and keep them at par. He promises to pay $1.25 in United States money on demand for each referendum dollar. To avoid interference by the Federal authorities for imitating the lawful money of the United States, Mr. Lesher makes his dollars six-sided.

THE Niagara Falls Power Co. is stringing aluminum cables on the power transmission line between Niagara Falls and the Tonawandas. This is the second transmission line built by that company in which aluminum replaces copper. Aluminum being so much lighter than copper, the new aluminum cables are larger in diameter than the copper cables in use on the original transmission line and will have thirty-seven strands, while the new copper cables have nineteen strands. The conductivity of the aluminum cables, however, will equal that of the copper cables; while the weight of material on the pole line will be very much lighter. It is significant that all of the aluminum transmission lines now in operation are successful. In this new Niagara line aluminum will be given a severe test, as the voltage at present is 11,000 and it is soon to be raised to 22,000.

WATER SUPPLY AND IRRIGATION PAPER No. 40, on the Austin dam, by Thomas U. Taylor, professor of civil engineering at the University of Texas, has been issued. The paper reviews briefly the history of the events which led up to the construction of the dam, and gives the specifications and describes the methods of building, as well as the more important engineering details. The flow of Colorado river is also discussed, and data are given of the accumulation of silt behind the dam. The final destruction by the flood of April 7, 1900, is described and causes of the failure are noted. Application for the paper should be made to members of Congress, by whom 4000 copies of the 5000 printed are distributed, or to the Director, United States Geological Survey, Washington, D. C.

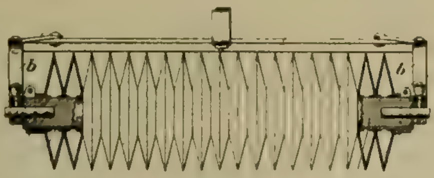
THOMAS A. EDISON has perfected a device for heating compressed air which, he asserts, utilizes all the store energy of coal and obtains fully 95% of it.

Mining and Metallurgical Patents.

Patents Issued November 13, 1900.

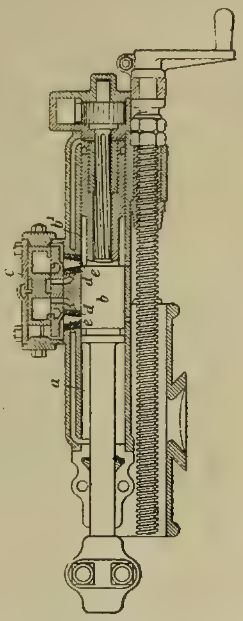
Specially Reported for the MINING AND SCIENTIFIC PRESS.

PULVERIZER.—No. 661,814; A. F. Peterson, Kent, Ohio.



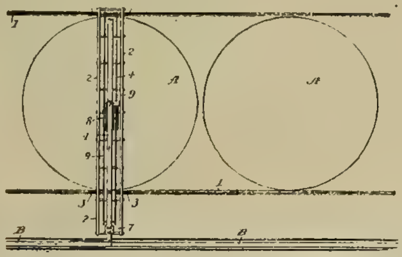
In a pulverizer, combination of frame, rotary shaft, series of closely arranged hollow metal disks rotatable independently on said shaft and together with shaft, means holding disks together on shaft, each disk having side walls widely separated at center and having flanged openings and narrow flat faces, walls converging oppositely from said flat faces and rigidly united at edge of disk, and circular cutting blade rigid with both walls and projecting beyond meeting line thereof.

ROCK DRILLING ENGINE.—No. 661,825; W. C. Stephens, Carn Brea, England.



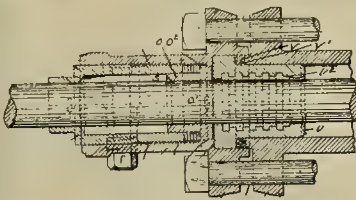
In a rock drill, employment in exhaust passage of elastic and compressible bushing having central passage provided with lining of suitable rigid material such as metal.

CONVEYER.—No. 661,842; H. W. Blaisdell, Yuma, Ariz.



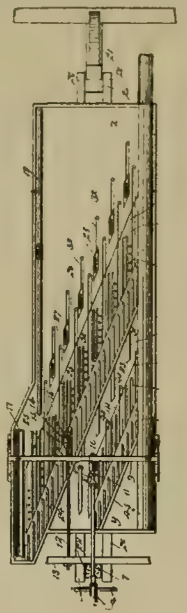
Combination of conveyer, stationary support therefor, movable bridge disposed at an angle to conveyer stationary support, conveyer on movable bridge, discharging device adjustable on fixed support and co-operating with conveyer thereon, discharging device on movable bridge adjustable from end to end thereof and co-operating with conveyer on bridge to discharge material at any point throughout length of latter.

ROCK DRILL CYLINDER HEAD.—No. 661,684; A. Ball and T. Officer, Claremont, N. H., assignors to Sullivan Machinery Co., same place and Chicago, Ill.



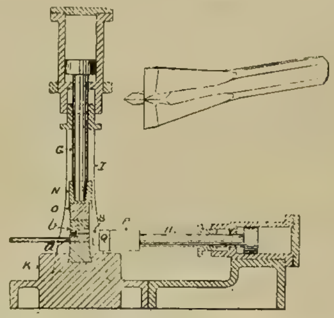
In a cylinder head for rock drills, comprising shell provided with interior screw threads and shoulder, bushing contained within shell and having shoulder engaging shoulder of shell, a partible gland extending into shell and over bushing, gland having exterior screw threads for engaging interior screw threads of shell and internal shoulder between which and end of bushing packing is interposed.

CONCENTRATING TABLE.—No. 661,886; I. F. Monell, Boulder, Colo.



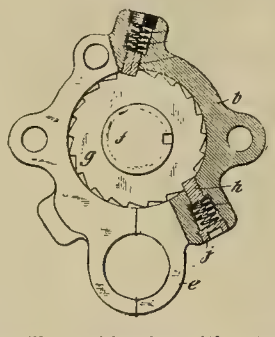
Concentrating table mounted to swing and arranged in an inclined position, having series of channels formed in it, arranged diagonally, certain channels being deeper than others and having communication with outlets, series of fixed riffles at one side of series of channels and also arranged diagonally, and series of adjustable riffles arranged diagonally at opposite side of series of channels.

APPARATUS FOR MAKING AND SHARPENING ROCK DRILLS.—No. 661,798; G. Glossop, Leeds, England.



In machinery or apparatus for mending and sharpening blunted and worn rock drills, combination of vertical hammer, horizontal hammer, anvil, hammer head N of vertical hammer having wing drawing and pointing die or tool d and holding die i, hammer head p of horizontal hammer having wing sharpening tool or die k, and anvil block being provided with wing pointing, forming and drawing die c and holding die h, and of double gripping device consisting of two hollow split taper gripping blocks n, tapered guides or slides connecting lugs q, rocking levers s, shaft r and foot lever p.

ROCK DRILL.—No. 661,927; R. L. Ambrose, North Tarrytown, N. Y., assignor to Rand Drill Co., New York, N. Y.

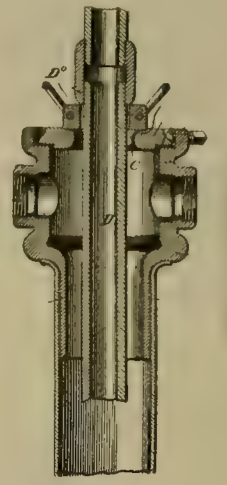


In a rock drill, combination with rotating bar and ratchet wheel secured to rotate therewith, of pawl mounted in drill cylinder head and having rectangular movement therein toward and away from face of ratchet wheel, helical spring mounted in drill cylinder head and adapted to press said pawl inwardly against face of said ratchet wheel, and means interposed between said pawl and said spring whereby spring is retained from accidental displacement through pawlways after pawl has been removed.

ELECTRIC FUSE.—No. 661,498; J. L. Cohen, New York, N. Y.

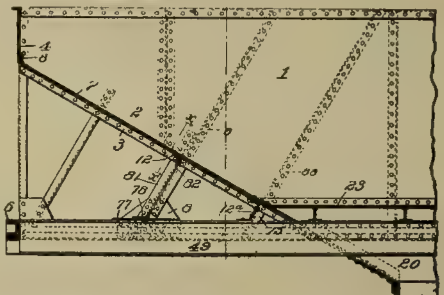
An electric igniting device consisting of non-conducting combustible material, compound affixed thereto, and conducting wire adapted for igniting and flashing compound and producing flame in connection with combustible non-conducting material when an excessive current of electricity is applied thereto.

CASING HEAD FOR OIL WELLS.—No. 661,913; C. Hayes, Franklin, Pa.



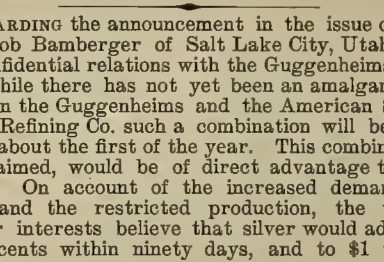
In an oil well apparatus, combination with drillers' casing nipple having its belled-over upper end; of casing head having tubular extension thereon fitted within belled-over end of drillers' casing nipple and having exterior concave curved shoulder resting upon said belled-over end of drillers' casing nipple.

HOPPER BOTTOM CAR.—No. 661,698; G. I. King, Detroit, Mich.



The combination with side and end plates of car body, of inclined floor plates arranged longitudinally, cover plate arranged centrally of floor plates, downturned flanges 3, at side edges of floor plates which extend to lower edges of side plates substantially throughout length of their inclined portions, and co-operate with side plates at this point, devices for securing flanges to side plates and means for securing outer end of floor plates to end plate.

DREDGING MACHINE.—No. 661,609; F. K. Hoover and A. J. Mason, Kansas City, Mo.



In a dredging apparatus, combination with suction pipe of debris trap arranged therein to intercept and trap debris and water-sealed valve for exit of debris from said trap.

REGARDING the announcement in the issue of Oct. 20, Jacob Bamberger of Salt Lake City, Utah, having confidential relations with the Guggenheims, says that while there has not yet been an amalgamation between the Guggenheims and the American Smelting & Refining Co. such a combination will be perfected about the first of the year. This combination, it is claimed, would be of direct advantage to producers. On account of the increased demand for silver and the restricted production, the united smelter interests believe that silver would advance to 75 cents within ninety days, and to $1 within a year.

THE Snoqualmie Falls Power Co. of Seattle, Wash., has succeeded in driving an electric motor 153 miles distant from the generator. All the lines of the company were connected up to one continuous circuit, commencing at Snoqualmie Falls, running to Seattle, back to the Falls, thence to Tacoma and back again to the Falls. The regular transmission is 153 miles to Seattle and 44 miles to Tacoma. The tests were conducted for experimental purposes, to show that electric transmission of power can be made commercially practicable at such distance.

Pyritic Smelting in the Black Hills.*

NUMBER II.

In Table II analyses of the Mansfield slags are given for the purpose of comparison. I have figured the alumina as a base, as we always did in our work at Deadwood. With the Mansfield slags before me, and the knowledge that, in iron smelting, slags (cinder) are made in which there are not—intentionally, at least—any iron, I was not discouraged over the slags. I had before me the work of Percy and Smith upon silicates, and their methods of experimenting with crucible charges. As I was restricted to a siliceous ore of even composition, barren pyrite and magnesian limestone, I set myself to work to see what slags I could make most easily and profitably of these materials. I mention the method of experimenting, as it may, some day, be useful to others.

TABLE II.—ANALYSES OF MANSFIELD SLAGS.

	Cu.......	SiO₂......	FeO......	Al_2O_3....	CaO......	MgO.....	Oxygen in acid..	Oxygen in base..	Silicate degree.	
									RO.	SiO_2.
1...	0.6	50.0	8.7	15.6	20.3	4.4	1.59	1	1.25	2
2...	0.3	47.6	4.7	14.8	18.4	6.7	1.65	1	1.21	2
3...	0.25	53.8	4.4	4.4	33.1	1.70	2.18	1	0.92	2
	0.3	48.47	4.64	17.0	23.2	2.2	1.56	1	1.28	2
	0.3	46.4	2.77	16.52	21.51	0.85	1.66	1	1.20	2
	0.75	48.2	10.75	16.35	19.3	3.2	1.52	1	1.32	2
	0.2	48.4	5.89	18.17	19.5	8.02	1.38	1	1.43	2
	0.3	46.8	7.21	17.64	19.15	3.68	1.48	1	1.35	2
	0.3	54.7	7.47	7.83	23.4	0.87	2.47	1	0.81	2

NOTE.—At Mansfield Al_2O_3 is figured as acid. I have here figured it as a base in order to compare these slags with mine.

At this time there were associated with me, at the Dakota School of Mines, Dr. H. O. Hofman, now of the Massachusetts Institute of Technology, and Dr. W. P. Headden, both of whom made valuable suggestions. The actual experimental work, which was long and tedious, was done under my direction by Theodor Knutzen, then a laboratory assistant at the School of Mines, and for years connected with the smelting works afterwards erected at Deadwood.

My idea was to take certain quantities of ore and limestone, and of pyrite, raw and roasted, and melt them together in a crucible, after the manner of Percy and Smith, until I had determined the most fusible and desirable charge, as well as the most profitable, that could be made from these constituents. We used Hessian crucibles, about 6 inches high, and an ordinary crucible furnace. The material was finely ground, and many charges in varying proportions were tried, the endeavor being always to use as much ore and as little limestone and pyrite as possible. We added carbonaceous material to the crucible charges, usually in the form of wheat flour, so as to imitate as nearly as possible the action of a blast furnace. After some experimental work, it was found that a charge composed of 40% siliceous ore, 45% of magnesian limestone and 15% of raw pyrite gave a clean fluid slag, and a matte button at the bottom of the crucible carrying practically all the gold and silver, thus getting the results which, according to Bloxam, are obtained from the smelting together of lime, quartz and pyrite at Zalathna, Hungary. These slags were analyzed and attempts were made to deduce formulæ for them. The only noticeable feature was that the slags were high in silica and (though made without the use of copper) were free from gold and silver, or nearly so.

Dr. Richard Pearce has shown that pure iron sulphide does not dissolve gold, while the experiments of E. G. Spilsbury at the Massachusetts Institute of Technology, in matting the auriferous sulphides of North Carolina, showed that gold could not be concentrated in an iron matte satisfactorily. I will refer to this later.

Having done so much with crucibles, the next point was to do the work in a large way. Six thousand dollars was subscribed, with which I bought a 36-inch round water jacket furnace, a blower and engine and boiler, and seven carloads of West Virginia coke, and erected an experimental plant, the so-called "baby smelter."

The charges which had worked best in the crucible experiments were tried, I confess, with much anxiety, for my lead smelting friends, with scarcely an exception, predicted failure and dire disaster. The first slags were duplicates of the experimental ones, and the furnace ran as smoothly as at any subsequent run. I made a carload of iron matte, carrying about twelve ounces of gold, sixty ounces of silver and no copper, took it to Omaha, sold it to the smelter there, and returned to the Hills with the argumentum ad hominem, the check in hand.

The work in the crucibles was never much modified. The slags from the blast furnace, however, while fairly clean, were not so notably so as in the crucible experiments; and this led me to believe that a reverberatory furnace would possibly have done better work, as it would more nearly have imitated the crucible experiments. It is said that when this raw smelting was practiced at Freiberg the reverberatory was preferred. We found it advisable to use somewhat more pyrite in our blast furnace work than had been found necessary in the crucibles.

The "baby" or experimental plant was operated for several months, when it was decided to build a larger plant upon the same lines. Our first Raschette furnace was but 84 inches long; the next ones were 120 inches, and the last furnaces erected were 144 inches long. Different degrees of bosh and of width were experimented upon. We found 36 inches about the best width.

For many months the charge remained siliceous ore, barren pyrite and limestone. The first charge was the substitution of Homestake stamp mill concentrates for a part of the barren pyrite, and after several years the barren pyrite was replaced by copper sulphide ores from Butte, Montana. The Homestake concentrates gave rise to large quantities of flue dust, which in time became very annoying. All attempts at briquetting the concentrates, even with costly presses, failed. The problem was finally solved by resmelting the flue dust in large reverberatory furnaces, and adding the resulting low-grade iron matte to the ore charge of the blast furnaces.

During our experimental work I made one experiment in briquetting the concentrates that promised success. I bought a tank of the so-called "sugar waste" of the sugar refineries. It is a coarse molasses. I mixed up the concentrates with it and water, as a mason mixes mortar. When it was allowed to dry it gave good results, but the plant smelled like a candy factory, and apparently all the flies in South Dakota came down to investigate. The sugar waste was not only cheap and did the work, but it also added carbonaceous fuel to the furnace as well. I believe the idea is well worth following out.

Our practice, as at Mansfield, where the ores also consist of earthy minerals low in iron, gave rise to "sows" or bodies of metallic iron. At Mansfield these sows were formerly sold in England at the price of pig iron. The ores at Mansfield carry no gold, and these iron sows do not take up the silver. Had we been smelting only silver or copper ores, we might have disregarded them, but owing to the gold in our charge, and the affinity of metallic iron for it, these sows were our richest product. In time they came to replace the brick in the furnace hearths and foundations. They were virtually blocks of solid metallic iron, weighing from twenty to forty tons, and carrying sometimes twenty ounces of gold per ton. It was extremely difficult, as well as very expensive, to break them up, but we formerly accomplished this by boring holes with a ratchet drill and repeatedly "shooting" them with dynamite, as many as fifty shots being sometimes required to break open the larger masses.

This was repeated until pieces of 100 or 200 pounds weight were thus obtained. Sampling them was out of the question, but I made arrangements to have them smelted by the Omaha & Grant Co., which treated them with a lead sulphide carrying no gold. As our sows carry little or no silver, the bullion obtained by this process was kept separate, and sampled alone, to the satisfaction of all concerned.

One day I found an account of the method formerly employed by the Detroit Copper Co. in treating large masses of native copper, which was to place them upon the hearth of a reverberatory furnace and smelt them down with pyrites. I set about arranging one of our reverberatories with a removable top and large traveling crane, intending to do the same with my iron sows, when the foreman suggested the passing of them beneath the roof of the furnaces at such times as it became necessary to rebuild the flues, which would save altering the roof. The first time a flue came down we placed forty tons of "sow" or metallic iron upon the hearth, charged the furnace with raw pyrites and copper ores, and fired the furnace. At the end of three days there was no sow in the furnace, nor was the hearth in the least injured, and several hundred ounces of gold had been recovered at mere nominal cost.

(TO BE CONTINUED.)

THE telephone has new uses every day; and, with each addition to its field, the simplicity makes people wonder why it was not tried before and what the limit of its use really is. One of the latest applications is a device which enables the conductor of a trolley car to talk to the officers of the company, and is applied on the St. Louis, St. Charles & Western Railroad in Missouri. In each car is placed a telephone box of the usual type, containing receiver and transmitter, but without the regular bottom box for the battery. In place of this the ground wire, which is concealed, is connected with the ground wire of the propelling motor; and the other wires, which are also hidden, are led through the car into the vestibule, where they are socketed to connect with the plugs on the device for making contact with overhead wires on the poles.

Mining Conditions in Rhodesia, S. A.

To THE EDITOR:—Rhodesia, a country of many promises and few fulfilments. Such, up to the present, must be the verdict. It is also the land of "excuses." If one is rash enough to ask why the gold output of the country does not come up to expectations, two reasons are always given: the rebellion and the rinderpest. Both are now some years old, and still the output is but little over 6500 ounces per month, and is practically stationary, one mine producing very nearly half of that. The want of native labor is also one of the reasons given, but, in many people's opinions, a very poor one. The native labor in the country is without doubt poor and ignorant, but since the shut-down of the Johannesburg mines that labor, which was on the whole fairly well trained, ought to have been available. The great drawback to the country hasn't been so much the "native" labor as it has the very poor "white" labor that is and has been in the country. Every white man who could talk the language, Kitchen Kaffir, and who could "boss" boys immediately after he had sunk a few regulation 30-foot holes, considered himself a miner, and, unfortunately for most of the companies, their highly-paid managers and managing directors knew no different, and so long as they were not required to go out into the country and look after the work they didn't bother how the "miner" got on.

Their salaries went on just the same, and so long as the "footage" was satisfactory and specimens came in, to be sent on to London, everything was allowed to go on just as it liked.

The country being nothing but a "fissure" country, in contradistinction to the Rand, which is a "bedded" country, has to be worked with as much care and attention as any other "fissure" country. The average of the gold contents of the veins does not, as first heralded to the world, run up into ounces. One can more nearly count the average in pennyweights on the fingers of one's two hands, and when one gets down to those sort of figures one has to have a careful and thoroughly capable manager to make both ends meet.

The thoroughly capable mine manager in Rhodesia is almost like the needle in the bundle of hay. Perhaps one reason for his absence is that the Rand offers better inducements, not only in salary, but also in salubrity of climate and the pleasures of life. Rhodesia has a bad name for fever, which to a certain extent is unjust. In the pioneer days no doubt fever had many victims, but since people have begun to live more rationally its victims have greatly decreased in numbers, and, although it may never disappear in toto, as civilization increases so fever will decrease.

One of the great drawbacks to the mining future of the country is that large blocks of claims are held by "developing companies," who expect to pay their shareholders dividends on "prospect" holes they float off on the gullible English public. They don't float off a mine. If they did, that would be all right; but most of them sink a few shafts, seldom over 100 feet deep, and do a few feet of drifting, and, of course, always on the best part of the vein, and then go in for "flotation." Shares are taken in part payment and then "boomed," and after a year's precarious existence the "flotation company" has to be reconstructed. And so the wheel goes round. Out of the enormous number of claims pegged in Rhodesia there certainly will be a few that will eventually turn out good, and if such companies as (shall we say?) the Exploration Co. of London or the De Beers of Kimberley would come in and turn some of these numerous prospects into mines, then the future of gold mining in Rhodesia would be assured. But until then the probabilities are that failure and disappointment will be the lot of most of the existing companies; and their failure will be principally due to themselves for not having got the proper men to look after their interests. Of the enormous sums of money that have been spent in Rhodesia, had only one-half of it been spent under capable and honest management, the gold future of the country would not be as bad as it is now, an unknown quantity. The country would either have a future before it or else it would be given up as a mining country and have to depend for its future on agriculture and stock raising.

Of the success of the two latter industries in the country there cannot be the slightest doubt, but with the same proviso as in the mining industry—capable and honest men, and not younger sons and ne'er-do-wells, sent out to make their fortunes, generally with the old Scotchman's advice to his son, "Sandy, make money—honestly if you can; but make money."

Salisbury, S. A., Oct. 17.

MINING SUMMARY.

ALASKA.

Nome reports that, as on the north California coast, nature through wind and wave has renewed the deposit of ruby sand on the beach, and stranded miners are out again washing the sand with profit.

F. D. Nowell, receiver of the Nowell properties, Seward City, is putting in a $2000 building to cover blanket sluices. Forty stamps are dropping.

At the Apollo, Unga, T. C. Mayon Supt., the tunnel is in 1800 feet, and forty stamps are dropping.

Good placers are reported found near Cape Dyer, between Point Hope and Cape Lisburn, 300 miles north of Nome.

ARIZONA.

GRAHAM COUNTY.

The October output of the Arizona Copper Co., Clifton, was 890 tons copper. New storage tailings bins are going in.

A. Rosecrans has added seven men at the Medler, near Clifton.

GRANT COUNTY.

The Summit group (lead) at Cook's Peak is reported sold to A. F. Fuller of Chicago for $150,000. Electric drills and other machinery will be put in.

MOJAVE COUNTY.

The new 50-ton Huntington mill recently put in on Burro gulch, near Kingman, is running satisfactorily. Maj. Mensch owner.

W. Weston, general manager of the White Hills mines, Mojave City, will sink the main shaft to the 1000-foot level.

PINAL COUNTY.

The London Globe Exploration Co. may buy the Glissan and Lawrence (gold) near Dripping Springs.

The Mammoth-Collins Co., Florence, will put in a pumping plant within next ninety days. Extensive development has been done on 760-foot level with good results.

Work on the Henry & Ritch Bonanza is being pushed.

Holman & Perkins are working copper property near Silver King.

Work has begun on the new steam plant to be put in at the Ray mine. Supt. Turman is expected back Jan. 1.

SANTA CRUZ COUNTY.

The Bradford (copper), near Bloxton, will put in a steam hoist and pump.

The Wetherill process of separation is in successful operation in Washington Camp.

YAVAPAI COUNTY.

The Whim shaft at the Copper Bottom, supplied with 22 H. P. gasoline hoist, is down over 100 feet.

Nellis, Shelton & Fisher, operating the Picnic group, have opened up a 5-foot vein running 15% copper, 7 ounces silver and a little gold per ton.

A body of copper sulphide was recently opened up on the 200-foot level of the Blue Bell, 5 miles southeast of Mayer.

Ten men are working at the Iron King, crosscutting, etc.

Ore carrying $50 gold, $20 silver and $10 lead per ton is reported opened up on the 130-foot level in the First Home, near Big Bug.

CALIFORNIA.

Secretary Benjamin of the California State Miners' Association reports that since the last annual convention there have been six meetings of the executive committee of the Association—the first, on Jan. 26, 1900, called by President Ralston for the purpose of obtaining a consensus of opinion and to decide upon a course to be pursued in regard to the mineral lands bill; to discuss the question of the preservation of forests and the conservation of water, and to take action toward urging the establishment of a department of mines and mining in the national Government. The second meeting, Feb. 20, 1900, was called to consider a letter received from Congressman De Vries, in reference to the elimination of certain lands in the southern part of California from the mineral lands bill; to endorse the bill prepared by the mineral lands committee in reference to oil locations, and to discuss the matter of scrip location in Shasta county. The third meeting, on March 17, 1900, was called, at the request of the committee on dams, to consider the advisability of sending a representative to Washington in the interest of legislation regarding debris dams. As there were but a few present, the matter was laid over until the fourth meeting, on March 23rd, when the report of the committee on debris dams was received and adopted, and A. Caminetti was authorized to proceed to Washington in the interest of the debris, mineral lands and petroleum bills. At this meeting action was also taken on Congressman De Vries' letter, and it was resolved that the Association refuse its consent to any amendments to the mineral lands bill that would eliminate any portion of the State. The fifth meeting, on August 13th, 1900, was called for the purpose of taking action regarding the suit of Sutter County vs. The Polar Star M. Co., to receive the report of the Association's special attorney in the Red Dog lawsuit, also the report of A. Caminetti, who had been sent to Washington in the interest of the Association, and to set the time for the annual convention. The sixth and last meeting was held on November 13th, and was called for the transaction of general business prior to the convention.

During the year, Secy. Benjamin states, many new members have joined the Association, and a great many inquiries have been received for literature and information regarding the Association and its aims and objects. The remaining volumes of "California Mines and Minerals," reported at the last convention, have been distributed among libraries and educational institutions in many parts of the world and to the different exchanges, excepting such copies as were sold. The edition is now exhausted, but the Association owns all the plates and half-tones, and it has been suggested that a second edition, with the addition of later statistics, would find a large sale and prove remunerative to the Association. The entire cost of that publication was $5858.33, all of which was raised by private subscription and from the sale of advertising space. All amounts pledged were collected, except one $50 subscription.

During the year the receipts of the Association have been $11,215.41, as follows: Cash on hand last statement, $4,211.33; souvenir book, $4,494.

San Francisco subscriptions: Dunham, Carrigan & Hayden Co., $100; San Francisco Miners' Association, $115; Giant Powder Co., $50; California Powder Co., $50; Parke & Lacy, $50; Selby S. & L. Co., $50; Pelton Water Wheel Co., $50; W. T. Garratt & Co., $50; Geo. E. Dow Pumping Eng. Co., $50; Risdon Iron Works, $50; N. Y. Belting & Packing Co., $50; Arctic Oil Works, $50; W. W. Montague, $50; Union Iron Works, $50; John A. Roebling Sons Co., $50; Paraffine Paint Co., $50; Abner Doble Co., $50; American Steel & Wire Co., $50; Joshua Hendy Machine Works, $50; Miller, Sloss & Scott, $50; Ames & Harris, $50; Tubbs Cordage Co., $50; Geo. H. Tay Co., $50; Crane & Co., $50; Carbon Hill Coal M. Co., $25; Schaw, Ingram & Batcher, $25; John Taylor & Co., $25; Meese & Gottfried, $25; General Electric Co., $25; C. C. Moore & Co., $25; H. N. Cook Co., $25; L. P. Degen, $25; North Bloomfield Co., $25; John Rosenfeld's Sons, $25; Mayflower M. Co., $25; Gutta Percha Rubber Co., $25. Total, $1615.

Advertising in proceedings, $360; Red Dog lawsuit, $120; banquet tickets, $95; badges, $86.30; El Dorado county, $75; Tuolumne county, $81; Yuba county, $50; membership certificates, $18; telegrams, $9.58. Total, $11,215.41.

The disbursements were as follows: Souvenir book, $4735.03; Commissioner to Washington, $773.50; convention account, $624.85; Red Dog lawsuit, $587.10; clerks and stenographer, $603; printing and stationery, $411.15; postage and telegrams, $293.47; office rent, $260; badges, $283.50; Native Sons donation, $150; Remington typewriter, $75; mineral lands committee, $64.67; Polar Star suit, $25; sundry expense, $19.01; press clippings, $19.50; engineer fund, $14.48; cash on hand in treasury, $2321.15. Total, $11,215.41.

This was made up on the 17th. On the 19th inst. the secretary further reported receipts as follows: Nevada county, $400; Placer county, $225; Butte county, $150; El Dorado county, $60; Santa Clara county, $52.50, leaving a balance on hand on that date of $3,208.65.

AMADOR COUNTY.

The three-compartment south shaft of the Mutual Baliol M. Co., Sutter Creek, is down over 700 feet.

The Baliol, Supt. W. H. Storms, has started a new shaft 2000 feet south of the Porter shaft. Good ore is opened up.

The Moon M. Co. of Valley Springs will work property 2 miles from Jackson.

BUTTE COUNTY.

At Bloomer hill the new mill is being driven as rapidly as twenty men can do the work. It will begin crushing quartz Dec. 1st.

The Buzzard mine, near Inskip, is to be operated under the management of W. H. Baker.

CALAVERAS COUNTY.

It is said that sinking on the property of J. Baldwin, Jr., near Copperopolis, costs $20 per foot.

At Angel's Camp, on the 20th, a slide at the Gold Cliff mine demolished the gallows-frame and engine house.

At a meeting of the stockholders of the Greek M. Co. at San Andreas the old indebtedness of the company was settled upon a basis of 75 cents on the dollar, and the mortgage was canceled.

Mr. Purdy of Valley Springs will begin development on the Comet, near there.

Work at the Hexter, in Jackass gulch, is resumed under Supt. Jones.

COLUSA COUNTY.

Last week the Empire Quicksilver M. Co. made shipments of quicksilver from the Abbott, on Sulphur creek.

DEL NORTE COUNTY.

H. Nicholas is opening up mining ground belonging to the old French Hill Hydraulic M. Co.

EL DORADO COUNTY.

(Special Correspondence).—Continuation of the ore bodies stoped in the upper levels of the Mount Pleasant has been found on the 850-foot level, giving this mine new lease of life. Its mill is kept crushing ore. A canvas plant is being constructed.

The Mount Hope, Baltic and Bullard quartz mines have improved in depth, inciting the owners to push work vigorously.

The Grizzly Flat drift gravel mine is doing well under the superintendence of W. Voss.

Grizzly Flat, Nov. 21.

O. S. Ford has men working on his copper property, 3 miles from Placerville.

The Michigan Bluff M. Co. is in 1000 feet on its tunnel.

Good cement gravel is being run through the mill at the Kimble.

C. C. Clark, Supt. Church Union, near Placerville, is unwatering the mine.

Twenty men are employed at the Ralston Divide, near Georgetown. A giant monitor will be put in in the spring.

Two men will work during the winter at the Wilton, near Volcanoville.

A mill test of five tons ore from north extension of the old Argonaut, near Greenwood, averaged $18.05 per ton. The test was made at the LaGrave mill, near Greenwood; the gold was 841½ fine.

Supt. F. Thomas of the Old Western, near Newtown, will resume operations early next spring.

S. McCleave and others will drive a tunnel at the Badger Hill.

HUMBOLDT COUNTY.

The Big Bear M. Co., operating on Klamath river, near Orleans, has spent $10,000 in equipping property. The flume from Slate creek to mine is 4 miles long. A No. 3 giant is used. Ten men are employed.

At the Trophy, near China Flat, the Campbell creek ditch is being put in shape for winter.

INYO COUNTY.

G. L. Albright of Bishop is putting in machinery in the new mill at Rhode's Marsh.

The Ratcliff, Ballarat, recently closed down owing to scarcity of water, will resume, and twenty stamps will be dropping shortly.

The Mineral Hill M. Co. has twenty men employed. They have a 6-stamp mill.

Mr. Stebbins is putting in a 6-stamp mill near Ballarat.

Salt Lake men are working fifteen men on property adjoining the Mineral Hill.

A German company is working the old silver tailings in old Panamint, with such good results that they will erect a smelter. They have let a contract for 500 tons of charcoal.

The Reward, Ballarat, is down 825 feet in ore. The 10-stamp mill is running. Ten more stamps will be put in.

After lying idle for years the old Montezuma has been sold to Chicago men for $15,000. This mine carries gold, silver and lead.

KERN COUNTY.

The Prosperity Oil Co. of Nevada City is organized. It has bought 320 acres land in McKittrick district, and will bore.

The Gray Gander Oil Co., Bakersfield, is drilling on 7-28-28.

In a recent test at the Lion's well, Bakersfield, 117 barrels of oil were taken out by the baler in two hours.

The Kern Oil Co. produces nearly 400 barrels of oil per day. A 3600-barrel oil tank will be put in.

The McKittrick Oil Co.'s well on 18-30-29, McKittrick, has 200 feet of oil sand at a depth of 900 feet.

The Sunset Standard Oil Co. has a rig up, ready for drilling.

The Pittsburg Oil Co. has resumed drilling.

The Sunset Czar No. 1 is producing forty barrels of oil per day.

The Dean, in the Slate range, has a 20-stamp mill running. The cyanide plant comprises one 260-ton tank and four 150-ton tanks. It is estimated that there are $60,000 worth of tailings on hand.

A good strike was recently made at the Kinyon, Randsburg. The ore is said to mill $200 to the ton. They have a stamp mill and a cyanide plant.

There are twelve shafts on the Butte, Randsburg, the deepest being 325 feet. P. H. McMahon Supt. A new gasoline hoist will be put in soon.

The Rademacher, Randsburg, shaft is down 200 feet.

Work on the Sidney group, under A. C. White, is progressing.

A gasoline hoist will go in on the Napoleon.

The Merton M. & M. Co, capital $250,000, will push work on the Merton claims, near the Yellow Aster, Randsburg.

T. W. Atkinson is down 70 feet on the Fraction, Randsburg. The ore mills from $10 to $40 per ton.

LASSEN COUNTY.

The output of Hayden Hill mines to date is as follows: Providence $100,000, Blue Belle $150,000, Brush Hill $750,000, Evening Star $250,000, Golden Eagle $1,500,000, Juniper $1,000,000, Hayseed $100,000, North Star $15,000; total, $3,865,000.

Supt. C. Crane of the Daisy Dean has twenty-five men working in mine and mill. A steam hoist, 40-ton mill and pumping plant are in.

LOS ANGELES COUNTY.

The San Jacinto well, Los Angeles, is down 600 feet.

The Scheffelin well, on North Main street, Los Angeles, has struck oil at a depth of 175 feet.

Oil is found at 1000 feet at the North Whittier, Whittier.

The East Whittier well is 1600 feet deep.

The Union Oil Co. has a 100-barrel per day producer.

MONO COUNTY.

At the Boston Con., Bodie, a 3-foot ledge of $25 ore is opened up.

NEVADA COUNTY.

The Deadwood and Colbert mines, in Willow Valley, are reported bonded to Eastern men, and it is said that machinery will be put in and work pushed.

The new machinery at the Nevada County, Grass Valley, is running.

A new compressor is in at the Mayflower, Supt. W. H. Martin.

The Franklin, at Willow valley, has resumed, and sinking will be continued.

The Federal Loan, near Nevada City, is pumped out from the 400-foot level, and good ore is being mined.

The new Huntington mill on the 16 to 1, near Grass Valley, on Poorman's creek, is crushing ore from the mine. W. M. Taylor, Supt.

Supt. Campbell of the Stiles, near Nevada City, reports a strike of a 2-foot ledge of ore. A water-pipe line is being put in; the mine is to be worked on a more extensive scale.

The Providence M. Co. of Nevada City is shipping sulphurets to the Selby Smelting & Lead Works of San Francisco.

The Board of Supervisors appropriated $250 to the County Miners' Association.

PLACER COUNTY.

The main tunnel at the Red Point, 12 miles above Forest Hill, is in over 3 miles.

The Herman M. Co. are putting in a pipe line from the Breece & Wheeler ditch to the mill.

PLUMAS COUNTY.

The Blue Bell G. M. Co. of San Francisco is incorporated to work property near Genesee; J. J. Sullivan Supt. Six men are working.

RIVERSIDE COUNTY.

M. J. Andrews, Supt. Indian Queen, Pinacate district, is placing new machinery at the mine preparatory to starting work. A 10-inch vein is opened up.

The Rincon Crude Oil Co., Riverside-Fullerton district, will begin drilling near the Montezuma property.

SAN BERNARDINO COUNTY.

At Gold Mountain, Supt. Spargo is quoted for the statement that sixty extra stamps are to be put in. A 4-inch pipe line, by which water is forced to the camp, comes from the highest artesian well in the State.

SAN DIEGO COUNTY.

Drilling is resumed on the La Jolla at La Jolla.

The San Diego County well is down over 600 feet.

SAN LUIS OBISPO COUNTY.

The San Luis Obispo Breeze reports a big pick-up on Spruce creek, P. Gillis having found a nugget weighing 4 pounds 10 ounces "solid gold." Gillis returned from Spruce creek with about $2500 gold. In the lot was the nugget.

SHASTA COUNTY.

The South Fork Development Co., 3 miles from Igo, will put on more men and start sinking a shaft.

Sheehan & Cannon have an 8-inch ledge on the Scorpion, near French Gulch.

W. & J. Blagrave have a lease on the Washington, to carry off and mill all surface dirt on the mountain. They are running through about twenty tons of dirt per day, running $4 to 6 a ton.

At the Gladstone, under new management, there are fifteen men employed. The Ohio tunnel is being driven.

At the American they are driving a tunnel to connect Tunnel No. 3 with No. 4.

G. Simmons has a lease on the Niagara.

A 12-inch vein was opened up recently on the Shafter, 5 miles from French Gulch.

The Redding Oil M. Co. will bore in Stinking Creek district, 7 miles from Redding.

Woodrow & Bush of Redding have bonded the Texas, near Whitehouse, and are working twenty men.

Thompson & Barber have leased the Mammoth and are shipping ore therefrom to Keswick.

On the Garfield, an extension of the Mammoth, three tunnels, aggregating 600 feet, have been run, and a 60-foot shaft sunk.

F. H. Beurich, Supt. Evening Star, is shipping ore to Keswick.

The California G. M. Co. will begin erection of new plant on the Bowery Bell, near Redding.

The Hiatt G. M. Co. is pushing work on the Cleveland, near Whitehouse. A steam hoisting plant is in on the 120-foot shaft. Drifting is in progress on the 120-foot level. Ore shipped to the Keswick smelter has returned $20 per ton. D. B. Hunt and others may buy the mine and push development on a larger scale.

W. Clark of Buckeye is operating the Keystone, near there. Ore has assayed $99.50 per ton. Returns from a 2½-ton shipment to the Keswick smelter gave $45.20 per ton.

SIERRA COUNTY.

Mountain Messenger: Another large nugget worth about $1500 was taken from the gravel in Ladies canyon a few days ago. It was found by one of the workmen, who was digging a trench. This is the second large nugget taken from that mine since they began fitting it up this season.

At the Comet the new track from the lower tunnel to the mill is in; air pipe is about laid and will soon run.

W. Wolf is putting in a 3-stamp mill and a gasoline engine to run the mill at the Ruby, near Downieville.

D. G. White of the Frost, in Hungry Mouth, has bought the old mill of the North Star mines in Strawberry valley and will put the same up on the Frost.

The new Middle Fork ditch, with capacity of 2000 inches, is completed.

SISKIYOU COUNTY.

J. O. Rusby, Supt. hydraulic mine, South Fork, near Etna, will put on men. New flume is under way; a dynamo for electric lighting will be put in.

J. Derry of Hornbrook is operating a group of mines on Printer gulch. Reports from San Francisco mint show gold from there to be .883 fine.

It is reported that the Sterling and Blue Jay mines, Fore & Co., near Coles, are closed down temporarily, owing to a disagreement about wages.

TRINITY COUNTY.

Payne & Clary, who recently bought the Boyce & Ellery ranch, near Trinity Center, have fifteen men working. Construction of a new dredger is being pushed.

Farris Bros. are putting in a 5-stamp mill on the Katy Foley, 3 miles from Carrville.

F. Fletcher has fifteen men working at the Headlight.

W. H. Hill, manager Last Chance, will begin prospecting with a Keystone driller on the Cush Given Ranch properties, near Junction City, recently bought from W. C. Given of that place. Should developments prove satisfactory, a dredger will be put in.

F. Hall has bonded the Sweepstake, near Weaverville, and is pushing work thereon.

The new mill of the Brown Bear Co., Deadwood, is running.

The Altoona Quicksilver M. Co. at Cinnabar is putting in hydraulic pipe.

Reports from the Las Perlas, near Abrams, are encouraging. Four feet of the vein gives assays of from $32 to $150 per ton.

TUOLUMNE COUNTY.

The Arrow, near Soulsbyville, is temporarily closed down during the erection of a new steam hoisting plant.

One hundred and fifty men are working at the Shawmut, near Jamestown.

Supt. Gorrie of the Santa Ysabel Co. expects to resume underground work. The new air compressor is in; eighteen men are working.

C. H. Knox, Supt. Riverside mine, Columbia, reports mill running on good ore.

Sinking is stopped for the present at the Tri-Color, Tuttletown, and drifting will be done on the 200-foot level.

The new Hope mill, Carters, is ready to run.

The McKinley Con. shaft is down 100 feet. At 93 feet ore was opened up.

The Triumph and Spartan may consolidate. In this event men will be put on and an auxiliary mill erected.

Sinking at the Poison Oak will resume Dec. 1st. The shaft, now down 200 feet, will be sunk to 450-foot level.

Supt. Moorhead of the Dreisam is in 50 feet on the drift on 400-foot level.

Timbers for the new foundation of the 10-stamp mill at the Hope, near Sonora, are going in. S. Ralston owner.

The boring machine of the Columbia Tunnel Co. is sold to Butte county men.

The Golden West M. Co., operating on the Comstock ranch, is putting in two boilers, engines, pipes, etc., and the new 10-stamp mill will soon be up.

YUBA COUNTY.

J. C. West of Strawberry Valley has received a permit to mine by hydraulic process his claim in Eagle gulch, near there. A restraining dam is built.

COLORADO.

BOULDER COUNTY.

The Alaska tunnel, starting at Brainerd Camp, near Ward, is in over 1500 feet.

The Village Belle will probably be reopened.

The Great Western Exploration Co. is sinking a shaft, now down 360 feet, to 660-foot level, on property on Big Horn mountain, near Boulder.

The new 30-ton concentrating mill at the Success, Ward, W. B. Rundle manager, is running.

Ouray wires that the sale of the Camp Bird mine at Ouray to an English syndicate is off. "The property will not be sold," says the owner, T. F. Walsh. "Had the prospective buyers been ready to pay over $7,000,000 cash when the deal was first talked of, it is probable the mine would have passed into their possession. Now I have decided to retain possession of the mine."

CHAFFEE COUNTY.

The Lone Star M. Co., St. Elmo, C. Holt manager, will sink a double-compartment shaft, put in new machinery, etc. Work will continue through the winter. A new compressor will go in on the Mary Murphy, Supt. Taylor. Work on the big tunnel will begin soon and seventy-five men will be employed.

CLEAR CREEK COUNTY.

On the Mendota group, recently sold for $350,000, the shaft will be sunk to the 500-foot level. Men will be put on. S. S. Badger manager, J. Old Supt.

The air pipe from the compressor to the mine, at the Pelican, Georgetown, is in.

The Anchor group, Freeland, is sold to G. E. McClelland, representing Colorado Springs men, for $50,000.

The Monarch M., M., T., T. & P. Co. of Colorado Springs, capital $3,000,000, is incorporated to work the Lake County, St. Patrick, Signorita, El Capitan and Toledo Side mines.

The Mixsell, Idaho Springs, has a 30-stamp mill with capacity of thirty tons ore per day.

The Mendota Co., Silver Plume, is driving a 250-foot raise to connect with the Grostburg. A new engine and boiler will go in on the latter about Dec. 1st.

The Bismarck ships ten tons ore daily.

The shaft on the Fraction, Idaho Springs, now down 450 feet, will be sunk an additional 100 feet.

The tunnel cutting the Big Soft, Mammoth, Billee and Ben Harrison is in 800 feet and is equipped with air compressor and drills.

FREMONT COUNTY.

The Colorado Portland Cement Co. at Florence turns out 500 barrels of cement daily. Fifty men are employed.

The zinc smelter to be erected in Canyon City will be general Western headquarters for the Mineral Point Zinc Co. of New Jersey.

GILPIN COUNTY.

The 94 M. & M. Co., Yankee, will lay a 10-inch pipe line to furnish water for the new concentrator.

The Rio Grande has opened up good ore in the 350-foot tunnel.

GUNNISON COUNTY.

The Reynolds Co., at Pitkin, has the air compressor, etc., in place, ready for work.

The Big Seven M. Co., J. Powell manager, will continue operations with the diamond drill.

The Citizen is shipping ore.

Lejune & Hartman are pushing work on the Euterpe group. A new hoisting plant is in.

The Ruby (coal), Crested Butte, is closed down for the winter.

HUERFANO COUNTY.

At the Bassick, near Walsenburg, sinking of shaft is progressing. The company is putting in a concentrator at Grape Creek.

Men are working at the Bull Domingo.

The Geyser will resume in sixty days.

The Huerfano Valley R. & M. Co. of Pennsylvania will put in machinery on oil property at Badito, near Walsenburg.

LAKE COUNTY.

Follett, Leppel and others, operating the Vivian, Leadville, have ore assaying 30% lead and twenty ounces silver to the ton.

The Gold M. & M. Co. is sinking a new shaft in Big Evans gulch, Leadville.

The Josie shaft has resumed.

Resurrection No. 2 shaft is down 800 feet. Stations have been cut and drifting will begin.

The daily output of the Home M. Co., operating the Penrose, Bon Air, Starr and other mines, is 250 tons. This will be increased.

The Rose-Emmet shaft, down 530 feet, is being sunk to the 605-foot level.

At the Coronado, Leadville, the diamond drill shows a body of high-grade iron ore below the 600-foot level.

Ore bins have been put in at the Seeley shaft, Leadville.

The Revenue Leasing Co. will use a diamond drill on the ground of the Royalty Co.

At Leadville, at the Arkansas Valley smelter, three new 150-ton furnaces are being constructed; one will be blown in this month, the others next month.

SAN JUAN COUNTY.

D. Umbel, Supt. Henrietta group, near Silverton, is hiring men.

The 24x67-foot two-story ore house of the Minnie Gulch M. & T. Co. is finished. An air compressor, engine and other machinery will soon be in. Work on the 3000-foot tunnel will start soon.

SAN MIGUEL COUNTY.

C. H. Nazro, Supt. Bessie mill, Telluride, is adding improvements to same.

E. G. Stoiber, owner of the Silver Lake, has 100 men working day and night on the new 150-stamp combination mill.

The Gold King Con. Mines Co., on Bonito mountain, have added forty stamps, making a total of eighty stamps, at their mill on Cement creek.

F. Trumble expects to resume work on the La Berta group, Ophir.

Work on the Deadwood 2000-foot tunnel is being pushed. Three shifts are working.

The report of Manager Herron of the Tomboy G. M. Co. from Sept. 1, 1899, to June 30, 1900, shows for the ten months a product of $446,665—a net profit of $160,000. Reports show development work accomplished for the ten months as follows: Drifts on the vein, 2401 feet; raises, 1103 feet; crosscuts, 152 feet. shaft sinking, 109 feet. Total, 3765 feet. The greater part of this work has been done on the 300, 700 and 800 foot levels. The ore above the 200-foot level is exhausted. Over the 300-foot level is in sight about 50,000 tons. Between the 300 and 600 foot levels a large tonnage, probably 200,000 tons, has been opened up of low-grade ore. On the 700-foot level two ore bodies have been opened up which appear to have their apexes near the 600-foot level. In both of these the vein appears as in the upper mine, and there is still more resemblance to the productive ores of past years in recent developments on the 800-foot level, where the vein is stronger and more oxidized than it has been on any level below the 300-foot. The company has a bond on four claims controlling the apex of the Elephant-Cincinnati-Argentine vein—the strongest vein in the district, so far as surface indications are concerned.

The report shows that during the ten months 46,716 tons of ore were milled in the company's mill and 72 tons of crude ore shipped. The milling expenses were $1.87 per ton and the cost of mining $3.77 per ton.

SUMMIT COUNTY.

The Excelsior mill, Frisco, run by electricity, recently made a run on a 100-ton lot of ore from the Excelsior mine.

Supt. J. A. Bush is pushing work on the Glen-Mohawk and Mount Gilead properties.

The Maximus, near Kokomo, is shipping again. This property was making regular shipments during the summer of high-grade gold and silver ore, and employing quite a force of men. Owing to the high altitude of the mine, 13,600 feet, it is a hard proposition to work and requires considerable money to operate. The lessees have to pay $10 per ton to haul the ore.

TELLER COUNTY.

(Special Correspondence).—McCormack, Connor & Clevender, who organized the Minna S. Mining & Leasing Co., are sinking on the Minna S. claim, on Squaw mountain; they have a depth of 300 feet; will sink to 500 feet.

Victor, Nov. 18.

(Special Correspondence).—The La Bella M., W. & Power Co. recently made some additions to its Goldfield plant. They now operate three 1000 H. P. engines for the generation of electric power. The plant also includes a 35 and a 12-drill air compressor. The 35-drill compressor operates to full capacity to supply air for drills in various mines in the district. The 12-drill compressor will be operated by an electric motor. There are fifty to sixty electric hoists operating within the district, and, as a general thing, they give good satisfaction. Their capacities range from 5 H. P. to 30 H. P., the 15 H. P. hoist being the size most in use. The deepest shaft over which an electric hoist is now working is 500 feet. In many cases these hoists are under lease to the mine operators by the company that furnishes the power. As an example: a 15 H. P. electric hoist is leased to a mine lessee at $55 per month, including power, the lessee contracting to use it six months.

The Cameron electric power plant, which belongs to the Colorado Springs & Cripple Creek Short Line Co., comprises two 250 K. W. rotary converters; one 250 K. W. direct-current generator, driven by an Allis Corliss engine. The power by which the rotaries are operated is generated at the Lake Morain plant, near Pike's Peak. Thus, the Cameron station is auxiliary to that of Lake Morain.

The Eagle ore sampler is getting well started and expects to be handling 6000 to 7000 tons per month after Dec. 1.

Goldfield, Nov. 18. WASCOTT.

(Special Corresdondence).—F. T. Osgood has a lease on the mine of the old Victor G. M. Co., and since the sale of the property under a judgment to D. H. Moffat, it is claimed some important ore bodies have been opened, and public attention is again directed to the Victor.

Altman, Nov. 12.

(Special Correspondence).—The Standard Leasing Co. have a lease on the Mountain Beauty, on Blue hill, which runs to July 1, 1901. Present work is directed to development, with J. D. Murphy in charge.

Independence, Nov. 15.

(Special Correspondence).—The Cripple Creek Ore Sampling Co.'s sampling mill is nearly completed. Its location is on the Midland and Short Line tracks, south of Bull Cliff, and it is called the largest sampler in the district. In the main, its work will be to sample and crush the ore that goes to the chlorination mills at Colorado City. It belongs to the same parties who control the Colorado-Philadelphia reduction works.

Altman, Nov. 20.

(Special Correspondence). — The Anaconda M. Co. is shipping about 1000 tons of ore per month as the product of various lessees. Recently the company installed a hoist at a point in the tunnel 1100 feet from entrance, where a shaft has been sunk.

Anaconda, Nov. 15.

(Special Correspondence). — The chlorination mill of the Economic Extraction Co., which was closed down two weeks while a bedding floor was being put in over the drier, has just resumed work again and expects soon to be running on about 200 tons of ore per day. Waste heat from the roaster is utilized by the drier.

Victor, Nov. 15.

(Special Correspondence).—The Ophelia tunnel, which has progressed to a point over 4000 feet from the entrance, is being pushed with three air drills, the work being under the management of J. M. Parfet. The work is being done with a compound, 6 H. P. compressor, having 16x16-inch cylinders. A second compressor, 12x12, has been used to charge a small tunnel locomotive, which operates by compressed air, instead of steam. At the tunnel entrance is also a high-speed engine which operates a suction blower that draws air from the breast of the tunnel through a 10-inch hydraulic steel pipe, the latter being painted inside and outside with an asphaltum preparation. As has been noted before, the Ophelia tunnel starts under the town of Cripple Creek, cuts through one section of Gold hill, through the ground of the Anaconda M. Co. and that of the Mary McKinney, pursuing a course toward Bull hill.

Cripple Creek, Nov. 18.

(Special Correspondence).—The Philadelphia & Pittsburg G. M. Co., who have expended about $90,000 in developing and equipping their Golconda mine, have been hoisting ore since Sept. 23. The shaft here is 660 feet deep, from which extensive drifting has been done. On the 660 level a 300-foot winze is being sunk, a gasoline hoist having been installed at the collar of the winze. At the surface is a gasoline hoist of larger size; also, a belt-driven compressor, run by a gasoline engine.

Victor, Nov. 16.

(Special Correspondence).—The Alamo shaft is 200 feet deep, with considerable amount of drifting at the 200 level. All this work is in the way of prospecting for ore.

The Irish Mollie shaft is 150 feet deep and sinking goes on. This property is well equipped with hoisting facilities. It belongs to the Mint M. & M. Co.

(Special Correspondence).—That section of the Mary McKinney vein which was crosscut by the Ophelia tunnel at 400 feet below the surface is 25 feet in width. At that point there is no water, though the Mary McKinney pumps 900 to 1000 gallons of water per minute, but this volume is now decreasing considerably.

Anaconda, Nov. 19.

W. S. Stratton, questioned regarding the present condition of the Independence mine, which he sold in London, says: "It is my opinion that the property has been worked too hard. The management has simply made a mistake in what it thought the property could do. I am satisfied that the Venture Corporation is absolutely honest in the handling of the stock company." The opinion of Cripple Creek mining men is that the London company has neglected to do the necessary development work and has drawn too heavily upon the ore reserves for the purpose of paying large dividends. J. H. Hammond, after an examination of the Independence mine, has cabled to London advising a reduction of dividends and extensive development. He is having assays made and will make a full report. He is confident that the mine has a great future.

The company has just issued from the London office a report covering the period of fourteen months, from May 1, 1899, to June 30, 1900. The balance sheet shows liabilities as follows: Shares issued (authorized, £1,100,000), £1,000,007; accounts and balances payable, £35,114; profit and loss, balance, £80,086; total, £1,115,207. The assets were: Cost of property—mine and land, £973,001; buildings and plant, £26,999—£1,000,000; ore and supplies on hand, £11,359; balances due, £28,663; cash, £75,185; total, £1,115,207. The revenue account shows:

Sales of ore		£705,762
Less freight and treatment		122,117
Net sales		£583,645
Royalties and rents		1,499
Ore on hand		10,104
Total		£595,248
Mine expenses	£63,089	
Repairs and improvements	11,363	
Shipping and selling	3,601	
General charges	14,331	
Development	12,867	
		105,251
Net balance		£489,997

The profit and loss account shows: Net balance as above, £489,997, less exchange—£2152—leaving, net, £487,845; interest and transfer fees, £2224; total, £490,069. The charges were: London office expenses, £9274: dividends, 40%, £400,003; income tax, £706; total, £409,983; balance, £80,086.

The Chicago-International M. & D. Co. has put in a new steam hoist on the Draper, Victor.

The drift on 400-foot level of the Whisper is in 25 feet south of the shaft.

The Gold Dollar is shipping ore from the first, third and fourth levels.

A strike was recently made at the Anaconda, on Gold hill, Cripple Creek; J. W. Cummings Supt.

The Atlantis Mines Corporation will sink to 600-foot level.

In the Gurley tunnel of the Rose Nicol two veins, 12 feet apart, have been opened up. Main shaft, now down 330 feet, will be sunk to 400-foot level.

Trussel & McHenry have leased property of Lipton G. M. Co., on Copper mountain.

Lessee Smith, operating the old World's Fair, on Gold Bond Co.'s property, Cripple Creek, has opened up ore on 60-foot level running 7½ ounces to the ton.

Preston & Co. are putting in new hoisting plant over the old 130-foot shaft at the Draper and will sink to 230-foot level.

Drifting on the 200-foot level of the Robert Burns, Guyot hill, Cripple Creek, is in progress.

E. H. Phillips has leased the Constantine and will sink a 400-foot three-compartment shaft.

The Camilla Leasing Co. are crosscutting on the 130-foot level of the Maud Helena.

The Mayflower Co., near Gillett, have men sinking a new 300-foot three-compartment shaft.

For the first fifteen days of November the Rio Grande sampler has handled 3500 tons of ore, averaging $45 per ton in gold.

The shaft on the Sitting Bull, now down 100 feet, will be sunk an additional 100 feet.

Work on the Pinto, Cripple Creek, is resumed. One shift is working and another will be put on within a month.

The shaft on the Rubie, Supt. Fitting, now down 950 feet, will be sunk an additional 200 feet.

The Elkton Con. M. Co. projects purchase of the Arequa plant of the Colorado Ore Reduction Works, Cripple Creek.

IDAHO.

ADA COUNTY.

The shaft of the South Peacock (copper), in Seven Devils district, near Boise, is down 320 feet. The Blue Jacket may resume.

E. T. Staples is putting things in shape on the Mountain Dot, in Black Hornet district, near Boise, for winter operations.

Two bars of gold were cast at the Boise assay office recently, valued at $36,322.42.

BLAINE COUNTY.

Work at the Golden Star, Hailey, will continue during the winter under Supt. Allen.

BOISE COUNTY.

The Middleman, Pearl, has resumed, and sinking will be done to 150-foot level.

Mr. Mitten, representing Boston men, is pushing work on the El Paso. Work will be continued through the winter, and a new mill will probably be put up next spring.

CANYON COUNTY.

The new forty-ton roller mill going in at the I. X. L., on Willow creek, near Caldwell, will be running by Jan. 1. Building will be 30x40 feet, engine 30 H. P., boiler 40 H. P.

CARBON COUNTY.

The Pleasant Valley Coal Co., will increase output of mines at Price by 2000 tons per day, which will give employment to about fifty additional men, making a total of 750 employes. It is said that there is work for 200 men at the company's new camp at Sunnyside.

IDAHO COUNTY.

The Mount Clemens & Idaho M. Co., Warren, will continue operations during the winter. The Silver King M. Co. is pushing work on the Silver King.

KOOTENAI COUNTY.

On the Conjecture, near Lakeview, sinking and drifting are in progress. Ore is chiefly silver bearing and shipments have netted about $60 per ton.

OWYHEE COUNTY.

Work at the Flint mines has been suspended. The property is owned by M. Holdredge of Nebraska.

SALT LAKE COUNTY.

Supt. McRea, Bingham Cop. & G. M. Co., Bingham, is hoisting ore.

SHOSHONE COUNTY.

The mill at the Crescent, near Pierce, is running.

The tunnel on the Leslie group, near Wallace, is in 500 feet. Nine men are working.

Outside work of the Morning M. Co., Mullan, is suspended for the winter.

Work on the Tamarack and Chesapeake, one mile from Burke, is progressing.

WASHINGTON COUNTY.

More men will be put on at the Iron Dyke, near Weiser, this winter. The new matting plant will probably be put in next spring.

MICHIGAN.

HOUGHTON COUNTY.

A new stamp mill will be put in on the Trimountain, of the Fay group, near Redridge, Supt. Chynoweth.

MONTANA.

FERGUS COUNTY.

The Yogo sapphire mines of the New Sapphire Mines Co., S. S. Hobson manager, will be worked during the winter.

H. Kendall has completed a 100-ton per day cyanide plant on North Moccasin mountain.

In Whisky gulch A. S. Wright is building a 300-ton cyanide plant.

The New Year cyanide mill treats from 150 to 200 tons ore per day.

Twenty stamps will soon be dropping on the Spotted Horse.

The Gilt Edge cyanide plant treats 100 tons ore per day.

GRANITE COUNTY.

C. Weingren has bonded two claims (manganese), near Phillipsburg. He will ship three carloads of ore daily to the Federal Steel Co., Chicago, with whom he has a contract to supply 5000 tons of the ore, which is said to run from 40% to 50% manganese.

The Hope stamp mill, Phillipsburg, has resumed.

LEWIS AND CLARKE COUNTY.

The Drumlummon Co., operating the Frankie, near Marysville, is sinking a 300-foot shaft near the property of the Montana Standard Co.

On the Ida the Montana Standard Co. has a 600-foot tunnel.

C. W. Whitley, manager Huffaker (copper), West Helena, has men sinking.

MADISON COUNTY.

At the Watseka, Rochester, the old Goodale shaft, now down 300 feet, will be sunk to the 400-foot level. A new hoisting plant is going in.

A new 1000-foot shaft will be sunk on the Climax. The mill is running steadily.

Glass Bros. have erected a 20-stamp mill at Silver Star.

About 250 tons tailings from the Glendale Works, Sheridan, are treated daily, being run through high pressure rolls and three-decked Bartlett tables.

J. F. Cowan has twelve men working on the Keystone and Strawberry mines at Pony. Operations will continue during the winter.

A body of copper ore is opened on the August Flower at Brandon.

MEAGHER COUNTY.

One hundred and twenty-five men are employed in the copper mines at Copperopolis.

A railroad will probably be built from Dorsey to Copperopolis next spring.

MISSOULA COUNTY.

At the Hidden Treasure, near Clinton, work is progressing.

NEVADA.

ELKO COUNTY.

The Dexter & Tuscarora M. Companies, Tuscarora, consolidated on the 15th inst.

Three and one-half feet of ore, assaying $100 gold per ton, is opened up in the Dexter, at Tuscarora.

The Slip mill, at Olinghouse gulch, lately repaired, has resumed.

The new water wheel at the Dexter, Tuscarora, is in and power is thereby doubled. Output is 140 tons ore daily.

EUREKA COUNTY.

A 100-foot tunnel will be driven on the Bay State, near Newark, recently bonded to W. D. Thompson and others.

Ore from the Ice King, at Bald mountain, near Eureka, was recently shipped to Denver, Colo., for treatment.

HUMBOLDT COUNTY.

J. E. Wilson, of Jackson Creek, reports 20 feet ore in the Tiger tunnel, near there.

Manager White of the Nevada Copper Co. expects to have the fifty-ton matte smelter in operation next month. A mixture of coke and charcoal, in equal proportions, will be used as fuel.

LINCOLN COUNTY.

At Stateline the Ophir M. Co. will build a 50-ton mill.

The Johnnie M. Co. will put in a steam hoist.

LYON COUNTY.

The Overland and Silver Hill mines, Silver City, report good cleanups recently.

ORMSBY COUNTY.

Williams & Adams are turning out ground gypsum from their Empire mill. The raw product comes from near Mound House.

STOREY COUNTY.

The Con. Cal. & Va. recently shipped to the Selby Smelting & Lead Co., San Francisco, one car of concentrates—896 sacks, or 62,655 pounds (railroad weight).

The Hale & Norcross tunnel is in 1874 feet.

WASHOE COUNTY.

On account of scarcity of water, no placering is being done near Wadsworth.

At the Bluestone (copper), in Mason Valley, two shafts have been sunk and crosscuts run. The ore runs 4% copper. A reduction plant will be built.

The shaft at the Ora, near Wadsworth, is down over 200 feet, the deepest in the camp.

The average value of ores reduced at the Ora mill since its construction is $27.95.

The Reno M. Co. and the Reno Reduction Works, Reno, will resume operations.

WHITE PINE COUNTY.

The Ida (lead), near Ely, is bonded to S. T. Thompson, representing Salt Lake, Utah, men.

NEW MEXICO.

BERNALILLO COUNTY.

The new mill for the Cochiti Reduction & Improvement Co., at Woodbury, is going in and it is expected to be ready for the treatment of ore within six months.

COLFAX COUNTY.

The Senate and Bobtail mines, near Elizabethtown, are sold to the Smithfield Co. for $10,000. F. Spurr is manager.

DONA ANA COUNTY.

Men are working on the Excelsior and on the Memphis (both copper), near Organ.

The Copper Bar M. & M. Co. has suspended development.

The machinery on the Torpedo is working satisfactorily.

The Copper Co. will put in new machinery on the Copper Bar.

LINCOLN COUNTY.

It is reported that the Kansas City Co., which recently bought the Compromise, White Oaks, for $20,000, has refused an offer of $100,000 for the mine.

It is reported that the Bethlehem Steel Co. of Bethlehem, Pa., has bought 4000 acres of coal lands and 4000 acres of iron lands near Capitan.

RIO ARRIBA COUNTY.

The Admiral G. & C. M. Co., owning the Dewey, the Sampson and the Schley, is working day and night shifts, sinking the main shaft on the Sampson, now down over 50 feet.

The Mexican King G. & C. Co. of Milwaukee, Wis., has bought the War Eagle group, in Headstone district.

The New Mexico G. & C. Co. of Milwaukee, Wis., is sinking a shaft on the Strawberry.

The Burnt Mountain G. & C. M. Co. of Milwaukee, Wis., has bought the Rusty Bucket & Sardine group, and is sinking a shaft at the junction of the two claims.

OREGON.

BAKER COUNTY.

The Tammany G. M. Co. of Sumpter is driving a 500-foot tunnel on the Tammany, near there.

During the past three weeks fifty carloads of machinery have arrived in Sumpter for use in mines near there.

The Baby McKee, Baker City, is putting in machinery.

The Bald Mountain ditch is under way. Ten-inch steel pipe will be used.

The Golconda, near Sumpter, is reported sold to Illinois men.

A 500-foot tunnel will be driven on the Gypsy; Supt. Hamilton.

The new mill at the Richmond of the Empire M. Co. is running.

Unwatering the 270-foot shaft Gold Ridge, Baker City. The 10-stamp mill at the Gold Ridge is running on ore recently opened up in No. 4 tunnel.

A 6-foot body of ore, running $10 to the ton, is opened up in 700-foot tunnel on the Golden Star group.

A recent clean up at the Phœnix, Baker City, returned eighty-five ounces gold.

The Golden Gate group, Quartz gulch, near Geiser, is being operated by California men. H. S. Sherard manager. A new track is in and crosscutting will be pushed.

Pending the placing of new machinery the Blue Jacket mine has suspended operations. The number of men employed before it closed was seventy-three.

GRANT COUNTY.

The Rialto group, near Granite, is sold to California men for $25,000.

The Red Boy is putting in a deep sinking plant.

The crosscut tunnel on the Strasburg is in 280 feet.

Work at the Alamo is resumed and two shifts are working.

Susanville reports a strike of free gold assaying $100 per ton on the Mayflower near there.

The Cougar, near Granite, is reported sold to Seattle men for $30,000. A 10-stamp mill is on the property. Work will be pushed.

JACKSON COUNTY.

Ore from the Bill Nye, in Gall's creek district, Jacksonville, is being crushed at the Humason mill with good results.

A. W. Sturgis of Forest Creek has his mines rigged up ready for a good run.

The Champion group is bonded by P. J. Jennings. The intention is to consolidate the Helena No. 2 with this group.

The Montreal & Oregon M. Co., operating the Ashland, near Ashland, will add five stamps to their 5-stamp mill, G. E. Ingersoll Supt. Thirty men are working in mine and mill. Good ore is found on 500-foot and 600-foot levels.

JOSEPHINE COUNTY.

The Columbia mines, at Placer, now have long distance telephone connection with outside points.

SOUTH DAKOTA.

CUSTER COUNTY.

Towner & Nelson of Custer are developing copper property on Spring creek, near there.

LAWRENCE COUNTY.

The twenty-ton cyanide plant, near Whitewood, operated by McLaughlin and others, will be run during the winter.

PENNINGTON COUNTY.

Ore from the Lena, near Hill City, recently ran $100 to the ton.

The Detroit, 8 miles east of Deadwood, is bonded to Ohio men for $30,000; owners, F. Lockhart & W. W. Challis.

UTAH.

BEAVER COUNTY.

The Cactus group, near Frisco, consisting of 700 acres land, is sold to A. B. Lewis and others.

JUAB COUNTY.

At the Utah, near Fish Springs, at a depth of 600 feet, connection is made with vein. Ore runs 300 ounces silver per ton. The main shaft is down 700 feet.

Work on the tunnel at the Yankee Con., Eureka, is being pushed.

Manager Wilson of the R. G. W., Eureka, has reached the foot wall of the vein 128 feet from the hanging wall.

Manager Kopp has closed down the Maple, Eureka, for the winter.

KANE COUNTY.

Barton Sewell of New York and S. Newhouse of Utah have joined Salt Lake men in the purchase of the Cactus group of mines.

PIUTE COUNTY.

M. C. Packard, manager Star Con. Co., Tintic, is pushing work on the Bully Boy and Webster at Marysvale.

SALT LAKE COUNTY.

A new compound condensing two-stage air compressor is going in at the mouth of No. 7 tunnel, on the Highland Boy, near Bingham. It will drive twelve heavy drills and is arranged so that electric power can be used upon its inception into the camp. The smelter enlargements are progressing, and Supt. of Construction G. K. Fischer thinks trial run will be made by Dec. 31st. Capacity of smelter will then have been increased to 450 tons. During week ending Nov. 17th Supt. R. White of the smelter forwarded to refineries of the East 120,254 pounds of copper, gold and silver bullion, with total of over 300,000 pounds for month to above date.

The American Smelting & Refining Co., Murray, are letting contracts for the new plant there.

The Bingham Copper & Gold M. Co., Bingham, will erect a large ore bin at the main tunnel in Copper Center gulch, near there.

The St. Joe shaft, Bingham, is down 200 feet. Ore shows 52% lead, twenty ounces silver and $1.60 gold per ton.

SUMMIT COUNTY.

The old Homestake, near Park City, is to be reopened.

Ore from the Naildriver, Park City, recently assayed 159 ounces silver, 17% lead, $4.13 gold to the ton.

The main tunnel at the Wasatch is now in 300 feet.

Kearns Bros. are pushing work on the Lucy.

On the Glencoe, in Glencoe gulch, sinking is in progress at the 1600-foot mark in the tunnel. A small battery may be put in next spring.

The tunnel at the Silver Bell, O. Rydvall Supt., is in 380 feet.

The aerial tramway for the Silver King is expected to be ready early in January. Two 70-ton track scales, each 54 feet long, are going in. The sampler building is about ready for the machinery.

Supt. Boyle of the Valeo has put in a pump to hoist water from tunnel to smelter site 150 feet above.

TOOELE COUNTY.

The Ingot M. Co., Mercur, has levied an assessment of 1 cent per share for development purposes.

Manager Weir of the Ajax, Tintic, expects to open up the ore body on 1000-foot level next month.

The Ophir Hill of Ophir will enlarge its mill.

WASHINGTON.

FERRY COUNTY.

The Republic mill, Republic, is crushing 150 tons ore daily.

On 200-foot level of the Quilp, Republic, a 15x10-foot station is cut and timbered with 16-inch stulls; the latter are covered with 3-inch planks. From this station a raise to 100-foot level will be cut.

The Tom Thumb, Republic, will probably resume next March, when the Republic mill will be able to handle twenty-five tons of its ore daily.

A new plant is going in on the Silver King, near Nelson, including a 500-foot smokestack, boiler and pump. The pump will lift 600 gallons water 500 feet per minute.

The annual meeting of the Clackamas G. M. Co. will be held in Republic on Dec. 1st at 1 P. M. The Republic Con., Republic, will hold its annual meeting on Dec. 20th.

Manager Fell of Athabasca, Nelson, furnishes the following results of mill run for October: Period of run, 29 days, 1 hour; tons milled, 445; approximate value of bullion recovered, $7000; approximate value of concentrates recovered, $2200; total, $9200. Total value recovered per ton of ore milled, $22.67.

Republic reports the cleanup of the first vat of ore leached at the Republic mill was 91.24% of the assay value. The vat was charged with 100 tons of ore, which was in the leaching bath nine days.

OKANOGAN COUNTY.

The Palmer mountain tunnel, near Loomis, is in 3835 feet, 137½ feet having been driven during October.

At the Puritan mines Manager Jackson has everything in shape for winter work. The flume is about completed and the new compressor is going in, R. Baggaly Supt.

Ore recently opened up in the 615-foot tunnel of the Review, Chesaw, assayed from $84 to $300 per ton.

SNOHOMISH COUNTY.

The ledge at the Nonpareil is said to be 80 feet wide and that it has been traced for 800 feet.

In crosscutting on 118-foot level at the Blue Bell, near Index, an 11-foot ledge of gray copper and red oxide of copper was opened up. Hunter & Lotstrom of Edmonds, owners.

SPOKANE COUNTY.

The Gertie G. M. Co., capital $100,000, is incorporated at Spokane.

The Chelan Transportation & Smelting Co. of Spokane is incorporated; capital $1,000,000.

WYOMING.

CARBON COUNTY.

The Boston–Wyoming Co. is building a 100-ton smelter at Encampment.

The Headlight Copper M. Co., Encampment, now sinking a 50-foot shaft on the Headlight, will sink an additional 100 feet.

The Doane at Ramber, near Grand Encampment, is reported sold for $250,000. A plant will probably be put in, E. S. Tice manager.

FOREIGN.

BRITISH COLUMBIA.

Ore from the Lavina group, near Argenta, in Lardeau district, nets $40 to the ton. The company will, in conjunction with the Government, build a wagon road. Work will continue during the winter.

G. W. Hughes has men working on the Sunset, near Sandon.

The Nip & Tuck placer property, East Kootenay, is sold to D. Griffith, who will operate next year.

The Paradise, near Windermere, R. R. Bruce manager, will probably ship 2000 tons ore this winter.

The new 18-drill compressor for the Velvet, Rossland, will soon be in.

The diamond drill is in operation at the White Bear.

The sampling mill and other machinery are going in at the Le Roi.

The winze at the Evening Star, down 253 feet, will be continued an additional 67 feet.

The West Kootenay Power & Light Co. will add to the plant at Bonnington to the extent of 10,000 H. P. This plant now has a capacity of 5000 H. P. It will involve the expenditure of $1,000,000, and the work will take a year to finish.

At the Ymir, Ymir, S. S. Fowler Supt., eighty stamps are dropping, crushing about 200 tons of ore per day. Either steam or water power can be used.

The Imperial Development Syndicate will put on men on property on Lexington mountain, near Revelstoke.

The True Blue of Kaslo is bonded to J. C. Drewry of Rossland.

Manager W. H. Sandiford of the Bosun Slocan has driven tunnel 400 feet.

The output for October of the St. Eugene, East Kootenay, was 3007 tons.

At the Hall mines smelter work on the new roaster is progressing.

It is said that the Puget Sound iron mine on Texada island may be bought by an American company.

Eighteen men are working at the Nettie L., near Lardeau.

The Cooper group, in Burnt basin, near Gladstone, is sold to W. H. Jackson of Rossland, representing an Eastern company. Work will begin next spring.

The St. Eugene M. Co., East Kootenay, will put in a new 15 H. P. hoist at the St. Eugene.

Following were ore shipments received at Trail smelter from different shipping mines for week ending Nov. 10th:

	Tons.
Centre Star	2.098
Le Roi	621
Iron Mask	136
B. C.	136
Snowshoe	31
Athelston	25
Enterprise	17
Payne	118
Bosun	20
Ymir	50
Sullivan	138
Vancouver group	20
Hampton	4
Valparaiso	2
Total	3,416

For the same week the matte shipped from the smelter was 171 tons and the bullion 91 tons.

The Lenora (copper), in Mount Sicker district, Vancouver Island, is reported bonded to New York and Chicago men for $3,000,000.

MEXICO.

P. Gerhart of Cripple Creek, Colo., will put up a mill on his property near Dios Te Guia, State of Chihuahua.

Mine owners of Zacatecas, Chihuahua and Durango will import 10,000 Chinese direct from China for employment in the mines.

At La Colorado, Sonora, the Creston-Colorado Co. are putting in machine shops and ore bins at the Wyman shaft, preparatory to starting up. The old roaster from Minas Prietas is also going in.

Ore from the Conforme, in Moctezuma district, Sonora, carries silver and gold.

A. B. Adams, owner of the Palmerito, near Playo Colorade, Sinaloa, on Gulf of Lower California, is putting in a 200-stamp mill on the property.

RUSSIA.

An English syndicate, capital £1,000,000, has a concession to exploit the Perhena gold fields, which are 370,000 acres in extent, in the Amur region, and will dredge the streams.

Personal.

R. CORY is in Salt Lake City, Utah.

J. A. CORAM has returned from Europe.

H. MOWRY of Salt Lake, Utah, is in Fay, Nev.

A. C. LUCK of Austin, Nev., is in Nevada City, Cal.

S. MURCHIE of Grass Valley, Cal., is in San Francisco.

OTTO GRAMM of Laramie, Wyo., is at Coarse Gold, Cal.

T. W. SPRAGUE of Boston, Mass., is in Los Angeles, Cal.

F. G. HARTMAN of Los Angeles, Cal., is in Sonora, Mexico.

A. M. WELLES of Denver, Colo., goes to Durango, Mexico.

P. GERHART, Cripple Creek, Colo., is in Dios Te Guia, Mexico.

T. A. RICKARD AND F. W. BAKER of London are in New York.

F. HALL, of Salt Lake, Utah, is in Madison county, Montana.

CHAS. D. LANE has returned to California from Nome, Alaska.

S. R. GUGGENHEIM AND L. FEUSTMAN of New York are in Mexico.

J. H. HAMMOND has returned to Denver, Colo., from California.

J. DERN, V. P. Con. Mercur, Mercur, Utah, is in Canyon City, Colo.

MANAGER HILL, of the Little Giant, Warren, Idaho, has gone East.

N. P. DOOLEY, of De Lamar, Nev., is now located in Salt Lake, Utah.

P. J. DONAHUE, of Salt Lake, Utah, is in Beaverhead county, Montana.

R. WALKER, Supt. Gold Hill, Grass Valley, Cal., is in San Francisco.

SUPT. E. A. DAVIS of the Ribbon Rock Placerville, Cal., is ill at that point.

W. G. BENHAM AND A. H. TARBET, of Salt Lake, Utah, are in Butte, Mont.

A. H. WARD of Alameda and Plumas counties, Cal., has returned from the East.

W. S. MORROW of San Jose de Pimas, Sonora, Mexico, has returned from the East.

C. A. ROSS of New York and Mr. Heckshor of London, England, are in Clifton, Ariz.

O. P. POSEY of the Bingham Copper & Gold M. Co., Bingham, Utah, is in New York.

P. GEO. GOW has returned to the Jumper mine, Tuolumne Co., Cal., from Europe.

C. E. LOOSE, Manager Grand Central, has returned to Salt Lake, Utah, from California.

W. L. HOGG, of the Montreal-Boundary Creek M. Co., Greenwood, B. C., is in California.

H. REAMER of Pittsburg, Pa., and W. D. Wrighter of Spokane, Wash., are in Slocan, B. C.

J. E. BAMBERGER of the Daly–West has returned to Salt Lake, Utah, from Denver, Colo.

W. H. RADFORD, Supt. La Grange hydraulic mine, Junction City, Cal., is in San Francisco.

J. H. WOLKOTTE, owner Gladstone, Carters, Cal., has returned there from San Francisco.

J. MILNER, late Supt. John A. Logan mine, Cripple Creek, has returned there from Nome, Alaska.

C. JAMES of California goes to German West Africa in charge of a mining expedition for Cecil Rhodes.

W. H. STROUT & SON, for many years assayers at Ouray, Colo., are opening an assay office in Denver.

G. MOORE, formerly with Kansas City Con. Smelting & Refining Co., Salt Lake, Utah, goes to California.

SUPT. D. HARMON, of the Gaston Ridge, Grass Valley, Cal., has returned there from San Francisco.

C. E. POTTER of Los Angeles, Cal., and F. M. Michelson of Philadelphia, Pa., have gone to Cedros island, Mexico.

J. F. HUMPHREYS, Pres. Britannia M. Co., Howe Sound, B. C., has returned to Vancouver, B. C., from the East.

P. H. CLARK, general manager Copper Bullion Co., Arizona, has returned to Pearce, Ariz., from Los Angeles, Cal.

V. BARND of Boston, Mass., and A. G. Campbell of San Francisco are examining the Two G properties, near Tybo, Nev.

W. H. FERRIER is now general manager Gooderham–Blackstock syndicate, Rossland, B. C., vice J. B. Hastings, resigned.

CHAS. J. BUSH, assistant Western manager Canton Steel Co., at Denver, Colo., has returned there from Deadwood, S. D.

J. B. HASTINGS, former Manager War Eagle and Center Star mines, Rossland, B. C., goes to London, England, to locate permanently.

W. A. WATSON, who resigned the position of superintendent of the Economic Gold Extraction Co. mill, Victor, Colo., is making a trip to Cuba.

F. D. BAKER of Denver, Colo., is in south Chicago, Ill., superintending the erection of an automatic sampling mill for the National plant of the A. S. & R. Co.

H. W. ASBURY has resigned the vice-presidency of the Darius Green M. Co., Arizona, to assume the general managership. G. W. Sparks succeeds him in the former capacity.

Commercial Paragraphs.

THE Globe Engineering Works of San Francisco has secured a contract for furnishing two 300 H. P. Sterling boilers to the Yellow Aster M. Co., Randsburg, Cal.

MR. JOS. H. WILLIAMSON, for nearly eighteen years business manager Manufacturers' Advertising Agency, New York City, has severed his relationship with that company to connect himself with the old established Viennot Advertising Agency, No. 524 Walnut street, Philadelphia, as its business manager in the place of Mr. Thompson, resigned. Mr. Williamson also desires to express his appreciation of the uniform courtesy extended to him by his many friends in the trade paper and general advertising field in the past, and will be glad to welcome them at any time in his new address, either at the office in Philadelphia, or at the New York office of the Viennot Agency, No. 127 Duane street, Graham building.

THE I. X. L. Co. of Idaho have purchased of the Colorado Iron Works material for a high-speed roller crushing plant, including elevators, screens, Bartlett tables, engine and boiler. The Middlemarch Copper Co. of Arizona have ordered a hoisting plant of the company, who formerly furnished a 42-inch round copper furnace for the same property. The British–Globe Mines Co. of Sonora, Mex., are being furnished a 36x68-inch silver-lead smelting furnace, with the Nesmith patent water vaporizer; also includes an English cupelling furnace. The Philadelphia S. & R. Co. at Pueblo, Colo., have placed an order with the same works for six large slag trucks of special design. The Colorado Iron Works Co. are also furnishing water jackets for the furnaces of the Arkansas Valley smelter at Leadville, Colo., and are building a 10-stamp mill for the Cochiti R. Co. at Bland, N. M.

AMBITIOUS MECHANICS who desire to obtain better positions and higher wages might investigate the free scholarship offer made in another column by the American School of Correspondence, Boston, Mass. Situated in a large city which is a recognized educational and industrial center, this well-known correspondence school has many natural advantages in teaching the theory of the trades and engineering professions. Without leaving home or losing time from work, the student pursues a thorough course of study under the directions of able instructors, who are always ready and willing to assist him. Instruction papers, prepared especially for teaching by mail, are furnished free. These papers, written in clear and concise language, as free as possible from technicalities, are considered by their authors superior to the ordinary text books on the subjects of which they treat. In addition, special information regarding any difficulties in their studies is furnished students without extra charge. It should be the ambition of every man to advance in his trade or profession. A mechanic with practical experience, supplemented by theoretical education, can command a better position than a man without such an education. The results of long experience in teaching by mail indicate that this method fully meets the requirements of men who have but little time for study.

Recently Declared Mining Dividends.

	Payable.
Empire State – Idaho M. Co., Idaho, 3%—$29,554	Nov. 15
Gwin Mine Development Co., California, 15c per share, $15,000; to date $126,500	Nov. 24
Breece M. Co., Colo., 5 cents per share—$10,000	Dec. 1
Buffalo Hump M. Co., Idaho, 1%—$30,000	Dec. 1

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR WEEK ENDING NOV. 13, 1900.

661,483.—PROTRACTOR—J. D. Barrie, Los Angeles, Cal.
661,595.—SWIMMING APPARATUS—J. S. Bartholomew, Guerneville, Cal.
661,842.—CONVEYOR — H. W. Blaisdel, Yuma, A. T.
661,863.—ROLLER BEARING—J. S. Godfrey, Harrington, Wash.
661,724.—AIR DRAFT PROPELLER—Newmarker Bros., Reno, Nev.
661,919.—CHIMNEY TOP—J. Newmarker, Reno, Nev.
661,891.—TREE PROP — E. K. Parker, Pomona, Cal.
661,726. — WASHING MACHINE — T. J. Pickett, S. F.
661,774. — SHOVEL — Sheehy & O'Neill, S. F.
661,941. — CAR COUPLING — Sullivan & Mahoney, Los Angeles, Cal.
661,834.—TRUCK—G. M. Williams, Santa Rosa, Cal.
33,544 — DESIGN — Brewer & Burfiend, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AIR DRAFT PROPELLING APPARATUS.—No. 661,724. Nov. 13, 1900. H. J. Newmarker, E. J. Newmarker & B. C. Newmarker, Reno, Nev. This invention relates to an apparatus designed to produce a rotary motion and power by means of a suitably journaled propeller wheel, and an apparatus connected therewith by which a current of air is caused to pass through the wheel and cause it to rotate. It consists in the combination of a horizontal chamber closed on all sides except one, and having an enlarged or recessed portion, a casing within said enlarged or recessed portion of the chamber and having a reduced extension from its upper side, a flue connecting with said extension, and a wheel journaled within the larger portion of the casing.

WASHING MACHINE. — No. 661,726. Nov. 13, 1900. T. J. Pickett, San Francisco, Cal. This invention relates to a machine for washing clothes. It consists in the combination of a tub with a convex faced plate therein having a stem. A transverse handle bar is centrally pivoted to said stem. There is a pressure platform adapted to bear the weight of the operator and connections at the ends of the handle bar, and other connections at the sides of the platform; ropes engage these connections and there are means on the handle bar for the attachment of the end of the ropes whereby the platform is adjusted with relation to the handle bar.

PROSPECTING SHOVEL.—No. 661,774. Nov. 13, 1900. P. J. Sheehy & R. E. O'Neill, San Francisco, Cal. This invention relates to a device for rapidly and conveniently prospecting sand and other gold bearing material, and separating the larger portion of the worthless material so as to determine whether there is sufficient indication of value to continue with the work. It is especially designed for use in the beds of streams or in other places where the surface is under water and not easy to reach. It consists in combination with a shovel having a handle and a concave bowl, of a perforated plate of less concavity than the bowl, and having its edges forming a close joint around the inner surface of said bowl, to form a chamber between the two. Means are provided for removably locking the plate to the shovel which consist of an elastic shank on the plate with key hole slots, and pins fixed in the shovel handle having heads which engage with the slots when the shank is pressed down upon them.

Latest Market Reports.

SAN FRANCISCO, Nov. 22, 1900.

SILVER—Per oz., Troy: London, 29⅜d (standard ounce, 925 fine); New York, bar silver, 63⅞c (1000 fine); San Francisco, 64c; Mexican dollars, 51c.

COPPER.—New York: Lake, 1 to 3 casks, $17.25 cash; carload lots, 17.00; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.75; carload lots, 16.60. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

The lowest bidder for furnishing 11,500 pounds of ingot copper to the Navy Department at Puget Sound, Wash., was James Clendennin, whose bid was 18.35 cents per pound.

LEAD.—New York, $4.37½; Salt Lake City, $4.00; St. Louis, $4.27½; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, Soft Spanish, £17 8s per ton.

SPELTER. — New York, $4.35; St. Louis, $4.15; San Francisco, ton lots, 5¾c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $14.50; gray forge, $14.00; San Francisco, bar, per lb., 2½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $20.00; open hearth billets, $23.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $28.50; San Francisco, ton lots, 30c; 1000 ℔s., 30½c; 500 ℔s., 30¾c; less, 31c; bar tin, ℘ ℔, 35c.

QUICKSILVER. — New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.00 ℘ flask of 76½ ℔s.; Export, $45.

NICKEL.—New York, 50@60c ℘ ℔.

MAGNESIUM.—New York, $3.00 ℘ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¼c; slab, 5¾c; bar, 7c.

BABBITT METAL.— San Francisco, No. 1, 10c.

SOLDER. — Half-and-half, 100-℔. lots, 18.70c; San Francisco, Plumbers', 100-℔. lots, 15.85c.

ASSAY LITHARGE.—San Francisco, 10c ℘ ℔, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

BISMUTH.—New York, ℘ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

PHOSPHORUS. — F. o. b. New York 50@60c ℘ ℔.

TUNGSTEN.—New York, ℘ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.—San Francisco, crude, $17 ℘ oz.; New York, $18.20 per Troy oz

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¼c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¼c ℘ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c ℘ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ℘ ℔.; soda ash, $1.60 ℘ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ℘ ℔.; blue vitriol, 5½@6c ℘ ℔.; borax, concentrated, 7@8c ℘ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℘ ℔.; caustic soda, in drums, 3@4c ℘ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ℘ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

SITUATIONS WANTED.

Assayer Desires Position —Experienced Chemist and Assayer desires position. Will go anywhere. Finest references. "Assayer," Box B, this office.

EXPERIENCED MINE FOREMAN,
who is a competent assayer and surveyor and has a good knowledge of Spanish, desires a position. Address O. R., care of Mining and Scientific Press.

Mining engineer with ten years' experience in copper and lead mining, milling and smelting, desires to secure position as superintendent or manager of developing or producing property in this country or abroad. Good assayer, surveyor and bookkeeper. Address "Montana," care of Mining and Scientific Press.

WANTED.—A position as superintendent for a mining company by a man of 16 years' practical mining experience; understands mining and milling (amalgamation, concentration and leaching); good assayer and accountant; would accept a subordinate position if good; references. Address "Advertiser," 1225 Webster St., Oakland, Cal.

A sober, industrious young man, who is a competent assayer, surveyor, draughtsman and bookkeeper, wishes a situation. Has had eighteen months' practical experience and two years' technical training. Is willing to make himself generally useful about a mine. Salary small object; opportunity to show ability considered first. References. Address "M," Mining and Scientific Press.

MINING ENGINEER (technical training), twenty years' experience as surveyor, assayer, superintendent and manager of mines and mills; business qualifications; linguist; at present general manager mining and milling proposition in Mexico; desires to make a change on account of health; best references. Address S. O., Mining and Scientific Press.

A Mechanical Engineer,
technical graduate, with four years' practical experience in steam and electrical work, is open for engagement. At present employed in the East.

Address FRANK S. TUCKER, care of J. F. Beede, 315 California St., San Francisco.

Engineers, Firemen, Machinists and Electricians: New 40-page pamphlet containing Questions asked by Examining Board of Engineers. Sent free. GEO. A. ZELLER, Publisher, ST. LOUIS, MO.

WANTED.

A Second-Hand Assay or Chemical Outfit or parts thereof. Address R. R. S., this office.

Charcoal Burner wanted. Must speak Spanish and be capable of burning 1200 cords of mesquite per month into charcoal for smelting. Healthy part of Sonora, Mexico. Salary $100 gold per month. Only sober man need apply. References and record of experience required. Address C. Coal, this office.

WANTED—A FIRST-CLASS STAMP MILL man amalgamator. Must come well recommended. No others need apply.
Address WATERLOO MINE,
Coarse Gold, California.

WANTED IMMEDIATELY.—A CHEMIST who has had practical experience lixiviating ores with the Hyposulphite of Soda.
Address REGULARS,
Care of Mining and Scientific Press.

WANTED.—MILLWRIGHT ON CONCENTRATOR work. State age, concentrators worked on, wages wanted and references.
FREDERICK T. SNYDER & CO.,
324 Dearborn St., Chicago, Illinois.

WANTED—FOR IMMEDIATE DELIVERY,

One Direct Acting, Double Drum Hoisting Engine; Cylinders about 18x40 or 20x42.

Equipment with post brakes and auxiliary engines preferred. Wire description and price. B. A. C., Rossland, B. C.

WANTED.

SMOOTH-ON TRADE MARK **COMPOUND**
AN IRON CEMENT

For repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts the same as iron, insuring a tight joint at all temperatures. Difficult flanged connections can easily be made with SMOOTH-ON COMPOUND, as it adapts itself to the flanged faces, whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching.

Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

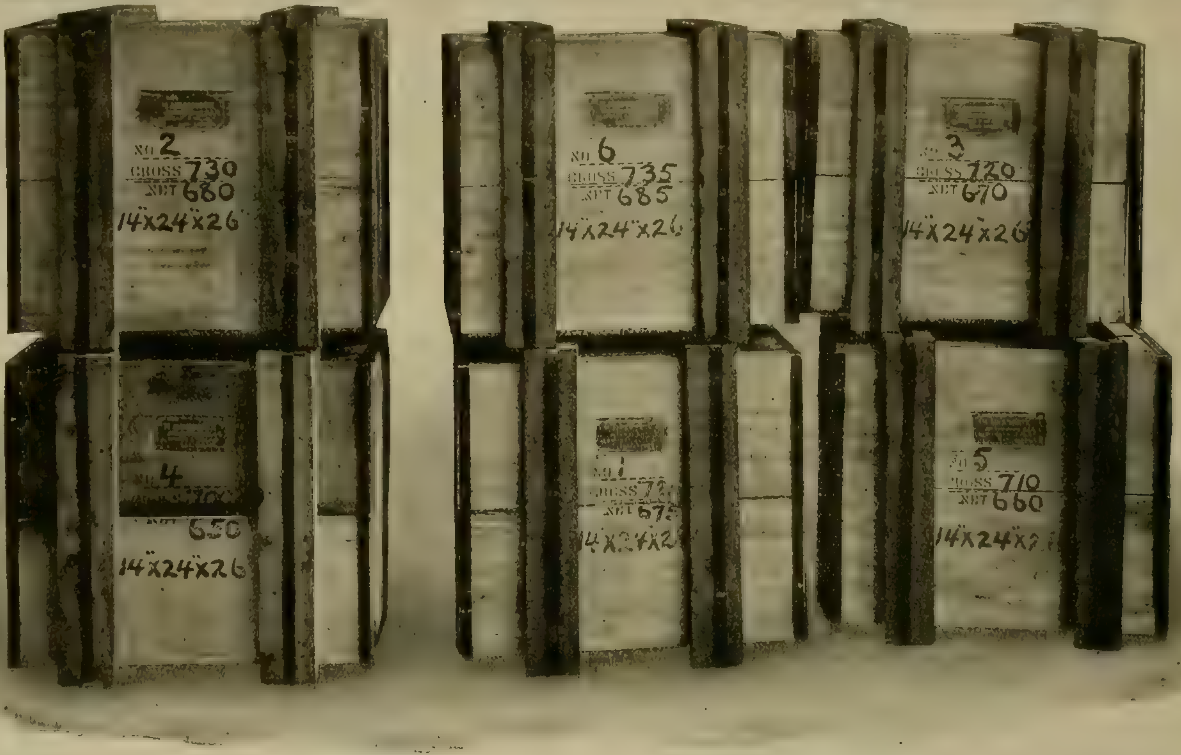
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

Whole No. 2106.—VOLUME LXXXI. Number 22.
SAN FRANCISCO, SATURDAY, DECEMBER 1, 1900.
THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Geologic Folios and Topographic Maps.

The U. S. Geological Survey has been engaged for eighteen years in making a topographic survey and map of the United States. The unit of map publication is an atlas sheet 16½ inches wide by 20 inches high. Three scales are used—one 1:62500, or about 1 mile to 1 inch; another 1:125000, or about 2 miles to 1 inch; the third 1:250000, or about 4 miles to 1 inch. On the mile scale an atlas sheet shows a tract 15 feet in extent each way and embraces an area of one-sixteenth of a "square degree," or about 240 square miles; on the 2-mile scale a sheet includes a tract 30 feet in extent each way, with an area of one-fourth of a "square degree," or about 920 square miles; on the 4-mile scale a sheet includes a tract 1° in extent each way, with an area of one "square degree," or about 3600 square miles, the area varying with the latitude. The maps are engraved on copper and printed from stone. The cultural features, roads, railroads, cities, towns, etc., and lettering, are in black; all water features are printed in blue; the hill features are shown by brown contour lines, the contour interval, depending on the scale of the map. An Act of Congress prescribes that the maps shall be disposed of by sale. They are sold at the rate of 5 cents a sheet.



Packing Mining Machinery for Foreign Shipment. (See page 561.)

The Joshua Hendy Machine Works, San Francisco, Cal. (See page 560.)

There is also in preparation a geologic map. Under the plan adopted for its preparation, the entire area of the United States is divided into small quadrangles, bounded by certain meridians and parallels; these quadrangles, in number several thousand, are separately surveyed and mapped. The unit of survey is also the unit of publication; the maps and description of each quadrangle are issued in the form of a folio. When all the folios are completed they will constitute a geologic atlas of the United States. Each folio is designated by the name of the principal town or of a prominent natural feature within the quadrangle. It contains topographic, geologic, economic and structural maps of the quadrangle, together with a general description. Copies of each folio are sold at 25 cents each, except such as contain an unusual amount of matter, which are priced accordingly. Prepayment is required. Remittance should be made by money order, payable to the Director of the United States Geological Survey, or by currency—the exact amount. Postage stamps, checks and drafts can not be accepted. The folios which are ready for distribution and those nearing completion are listed in a circular, which will be revised from time to time as other folios are completed, and circulars concerning the distribution of topographic maps and other publications of the Geological Survey may be had on application. Communications should be addressed to The Director, United States Geological Survey, Washington, D. C., from whom a list of sixty-five of these folios ready for distribution and twelve more approaching completion can be had. All this in answer to numerous questions.

The ups and downs of mining stocks tend to injure legitimate mining as a business, as the losses occasioned by stock fluctuations deter those who would put money into mine development as an investment. Booms and speculative eras are always followed by depression in the mining business, which must rely on merit alone. It is this that makes the present period so prosperous, as in the absence of speculative excitement the value of the industry itself is made manifest to those who view it as a legitimate business in which is to be found permanence and profit for legitimate investment.

◆

Beginning the 1st of next month, the estimated cost of platting and other office work in connection with the survey of mineral claims will be computed as follows: For lode claim, $30; for placer claim, $35; for millsite, $30; for millsite included in one survey with a lode claim, $15; for each lode claim within and included in the survey of a placer claim, $15; for several lode locations included in one survey, the first location named, $30; all other locations included, each $20; for several placer locations included in one survey, the first location named, $35; all other locations included, each $25; for affidavit of $500 expenditure of improvements, after approval of survey, $5. Should an amended order issue, an additional deposit will be required.

◆

In his annual summary of the mineral production of the United States, Dr. David T. Day, Chief of the Division of Mining and Mineral Resources of the United States Geological Survey, gives eloquent reason for the creation of a governmental department of mines and mining, with a cabinet secretary. in showing that the total value of the minerals produced during the last calendar year amounted to $976,008,046, an increase in value of nearly 40% as compared with the figures for the preceding year. For the first time since 1889 the value of the metallic production exceeded that of the non-metallic products, the figures being $527,218,084, and $448,789,962, respectively. This is a great showing, and warrants the demand for the creation of such a department. To such creation there is no active opposition, the chief obstacle to the fruition of the idea being public indifference.

◆

In the tunneling of the Simplon, in Europe, now in progress for two years, Engineer Brandt in charge has made notable innovation in such boring. Ordinarily the hole has first been driven, then further excavation made, followed by the finishing masonry. In the Simplon two holes are driven, parallel within the radius of the excavations, leaving a dividing line, one hole being excavated about 56 feet in advance of the other. These holes are built for a single track, the idea being to break away the dividing wall should increasing traffic make double track necessary. At distances of 656 feet transverse connections, provided with doors, are made between the tunnels through the dividing well. For ventilation air blasts are blown into one side of the tunnel, returning through the other side of the divide, carrying out foul air and gases. The heated air of the interior is cooled by showers of cold water brought in from higher on the mountain under high pressure. In this way air at 120° F. is cooled to 60° F. The same stream furnishes 1000 H. P. for driving the drills, which are rotary. The tunnel will be 12.4 miles long, and is about half finished, as elsewhere strikes and other accidents retarding its progress.

Different Methods==and Results.

Different business firms and different localities show difference in business methods; more especially is this the case among manufacturers. Some manufacturers constantly act as though they feared some one would find out what they are making, to whom they are selling it, what they are getting for it. There is a general air of "Sh—sh" about their establishments. Others want to tell about what they are making, to whom they are selling their makes, and how much they are getting therefor; what they made this year, and how much they have on their order books. It is a difference in methods. The reticent and the open are alike supposably striving for success. Usually it is best attained by a knowledge of human nature, and human nature invariably and inevitably inclines toward the frank, open-hearted man. So true is this that even where frankness and candid exposition of plans and results are not natural, their very semblance aids in success. Many clever business men, merchants, manufacturers and vendors achieve success by the assumption that people are interested in them; that they are of sufficient importance, anyhow, to justify public interest; that if people are not interested in them it is the fault of the people, and they propose to take the public into their confidence and tell their business to them so that they may be interested. When such people have an order for a stamp mill, or air compressor, or smelter, or wire ropeway, or electrical plant, or a dozen concentrators, or anything else in their line, they straightway tell it to the public, and thus get thousands of dollars' worth of advertising free. They get ahead, too, and build bigger shops and get larger contracts, while the men who whisper "Sh—sh," and gag with grief if any one mentions them, keep struggling along in a small shop in a back street. It is one of the proudest prerogatives of an American citizen to conduct his business as best pleases his sovereign fancy, but to those who are striving for success there would seem to be an object-lesson in the fact that the successful are those who believe that success will follow on the heels of success; that not only "nothing succeeds like success," but that nothing succeeds but success, and that one great secret of commanding success is to go on the principle that people are interested in you, that you are of sufficient importance to justify such interest, and that you propose to create, maintain and constantly gratify such interest.

If you get people interested in you, you can always command a share of their trade. Of course, one may fold his arms, disdain such common, vulgar notoriety, and starve in dignified seclusion, but that isn't business. It may be lofty and grand, but it isn't business, and the man who is constantly dodging into a dark corner, lest his existence be discovered, while he may be a paragon of goodness and virtue, is not a business success. This is a mining and scientific axiom that does not admit of successful contradiction.

◆

Some encouragement to the miner is vouchsafed in the statement from Washington, D. C., that Thos. H. Carter of Montana is to be Secretary of the Interior to succeed Secretary Bliss. The Interior Department has charge of the mining industry, so far as the mining industry is afforded any governmental recognition at all, and Carter is a mining man. It is not intimated that because of this that miners will or should receive any favors, but with a miner in the President's cabinet the miner might be accorded a fairness born of some personal knowledge of the facts so often to be passed upon by that department.

In Darkest Russia.

The United States Government appears at present to be "booming" the mineral development of Siberia. During the past week three government reports from Washington, D. C., have been received in this office, telling how wonderfully rich Siberia is. Two of these state documents are written by Thos. Smith, United States consul at Moscow, Russia, whose imagination seems to have been fired by the alleged discovery, "200 miles west of the Yenesei river," of quartz outcroppings carrying gold, milling $18 per ton. Part of our zealous government agent's long reports sounds like a promoter's prospectus. The following excerpt will make the miner smile: "The quartz appears very lively in all the veins yet uncovered and exhibits the marks of decomposed sulphurets. It is, therefore, highly probable that the great majority of the free gold exists below the water level in the form combined with iron sulphide. It will, of course, after water level is reached, necessitate treatment of chloridation or potassium cyanide. Water level in this particular locality must, however, lie at considerable depth, so that the tenor of these veins may be thoroughly established by the use of small mills, of free milling capacity only, before the refractory portions of the veins are encountered."

In further appeal to his fellow countrymen, Consul Smith vouchsafes the information that the climate "in some respects is perfectly enjoyable." True, "the temperature drops as low as 30° to 40° F., below zero," but then "the fall of snow is very light." Of course, where "the fall of snow is light," life to the American miner in Siberia should be one joyous round of pleasure, even though for five months in the year the thermometers register "a temperature of from 30° to 40° F., below zero."

The Government is sending out considerable of this kind of stuff. It gives a deserving printer employment, and furnishes a little fun to the miners who read it, but does not tend to enhance popular respect for the value of American consular reports.

◆

In this issue appears in its entirety a paper on "Stamp Milling of Free Gold Ores," read by Dana Harmon of Nevada Co., Cal., before the Technical Society of the Pacific Coast, in San Francisco, Cal. It is notable in three instances: it is written by a man who has daily done for many years the things he talks about; it is the longest and most practical talk of the kind that has appeared for years on this subject, and it is from a thoroughly independent standpoint, regardless of whose theories are attacked or whose ideas are disturbed. In accordance with the policy of this paper—an open forum where ideas are admitted and the truth alone survives—the article is given place just as furnished by its author. It will probably elicit discussion, as it is not at all orthodox in its statements, and goes against some tradition and precedent. If it occasion agitation or thought on the matter, to the result of progress therein, it will have served a useful purpose. If there be anything in it susceptible of successful contradiction, our columns are equally open thereto. This journal does not editorially endorse the statements made in Mr. Harmon's paper, but prints it because of its progressive and positive discussion of subjects that are constantly interesting to miners and millmen everywhere.

◆

Great Britain sees her foreign mining machinery trade transferred to the United States, and is studying the causes of successful American competition. Such change in commercial conditions has a variety of causes; chief among them is the underlying fact that British manufacturers are crystallized around a set of standards that to the insular mind is orthodox, while American manufacturers look to the past only to select the best and disregard the obsolescent. With the American there is no limit to progress, and expense is made secondary to success.

◆

The getting together of the American Smelting & Refining Co. and the Guggenheims, as previously announced, is not a sale of the latter to the former, but a consolidation of those two smelting interests. The consolidated concern will be a big factor in the metal markets, buying ores, smelting and refining, and annually producing 75,000,000 ounces silver, 2,000,000 ounces gold, 300,000 tons lead and 100,000,000 pounds copper. The smelters on the Pacific coast continue independent.

Stamp Milling of Free Gold Ores.

[A paper read before the the Technical Society of the Pacific Coast, Sept. 7, 1900, by DANA HARMON.]

A well threshed field. From one point of view, talk is idle—your proverbial millman always catches all the gold. From another, it may be called assault and battery on good nature to say even a word more.

But one has only to travel to find all sorts of methods, much guessing and not enough assaying. Many and deep are the ruts. Somebody must be wrong. Every decent body can learn. Discussion does clarify.

Quite as important is it to catch the gold as to find the ore. In these low-grade days a fellow should be a milling man as well as a "mining man," whatever that well-worn term may mean. Mining has gotten down on all fours with any other business. To the capitalist there is no essential difference between a cotton mill and a quartz mill. The girl at the loom does not run the loom. No more should the battery boy decide how to amalgamate his ore. A superintendent should not have to run to and fro hunting for a "good millman"—he should be able to make one out of raw material.

I have had to do with many different types of mortars and on varied ores, the stamps running from 700 to 1100 lbs. Furthermore, it has been my good fortune to use side by side from the same line shaft, on identical ores, with the same screen, batteries of three different types of mortar, doing this last for over two years continuously. Certain definite conclusions have, therefore, been hammered into my head, touching mortars and weight of stamps.

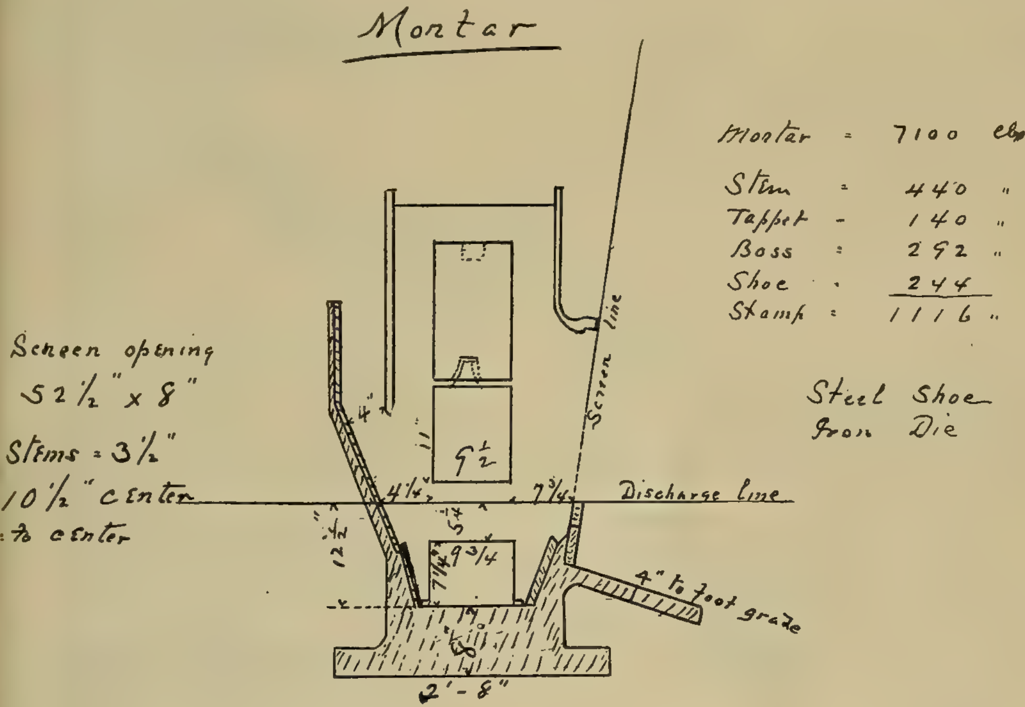

Fig 1

MINING AND SCIENTIFIC PRESS

As for the other matters of mill practice I would not have it understood that I have reached any one given method of treatment applicable to all ores.

I have learned to discard notions that once were holy as though from the Koran—these notions of ancient and honorable lineage, of good report, bearing the greasy thumb marks of the craft. I have been taught the secret work of the fraternity, for I have carried the dinner pail and have worn cotton in my ears, the pass tokens of the lodge. I call these notions, because none of them went to the root and logic of the business. Well, these have had decent burial. Let them rest.

There are, however, fundamentals to which I wish to address myself to-night. I believe that these underlying principles must be followed for all ores falling within the lines of my caption.

The local variance which must be had for ores of different localities are mainly those of screen and water, matters determinable by assaying the tailings.

Machinery.—Without going into the details of mill construction, it may be well to note some points bearing upon the work to be performed. Millwrights are seldom millmen.

There are all shapes of mortars and tables. Figs. 1, 2 and 3 show my own preferences.

There is such a wide difference in jar between the 850-pound and 1100-pound stamps that for the latter most substantial construction is essential.

Back Knee Frame.—I prefer the back knee frame because of its solid bracing to the ore bin, the tappets are in plain sight, the pull of the belt is downward on the cam shaft, it requires less lumber. I build a flat bottom ore bin in order to strengthen the anchorage and bracing.

The objections that such line shaft is subjected to dirt and awkward position need not be. Set the base of the mortar 6 feet above the ground, instead of 3½ or 4 feet, as is customary with contractors. This will give plenty of head room around the shaft and pulleys. Tight wood boxes encasing the shaft bearings will keep out dirt. Plank or cement this mud sill floor. Whitewash every post and wall; oil cups on bearings.

In figuring on power the uncertain factor is friction, and if bearings are to be saddled with dirt and gum, as in the dark they surely will be, power is wasted. There is a good bit of the personal equation in friction.

Mortar Blocks.—If wooden mortar blocks are used, make them long—16 feet—set on solid rock foundation, with a bedding of 1 inche of clean sand. Ram with concrete on sides and ends. This concrete should not be continuous all around the mortar blocks. There should be open spaces leading to the bottom of the pit, these spaces to be filled with sand, dry, or tailings run in. There is no better preservative to wooden mortar blocks than constant wetting. These sand pillars ensure thorough saturation of the wood.

Excavate the pit so that you can also build up a concrete pier for the battery posts to rest on. Have anchor bolts in these piers so that you can draw-bolt the battery posts solid to the concrete. Ordinarily the battery post is mortised into the line sill, the latter being bolted to the mud sills; but this method leaves a wide space and allows the post to spring.

The mortar blocks can be solid, i. e., two blocks bolted and keyed together, or they can be built up of 2-inch plank nailed and bolted together. The mortar bolts are usually 1½x30 inches. I think they should be longer, say 42 inches.

Concrete Mortar Blocks.—Within the past few years concrete mortar blocks are coming into vogue. The concrete is capped with a single block of granite or iron, a sheet of lead between the mortar and this capping. Another plan has been to omit the granite or iron cap piece and instead make the base of the mortar wider. Battery posts also set on concrete piers.

I do not know how well these have withstood the jar of heavy mills. Nor do I consider that their withstanding the jar of a 900-pound stamp is any evidence or proof of the effect an 1100-pound stamp will have upon them.

It is reasonable to expect greater crushing capacity from such rigid foundations. I should look for crystallized bolts because of this very rigidity. But I shall endeavor to show that we can crush as much as we are able to amalgamate in mortars set on wooden blocks.

It is urged against the wooden block that it will rot out in eight to twelve years; that it is well nigh ruined if the mill stands idle a summer or two.

For myself, I should say it does not matter what happens to a mortar block upon an idle mine.

It has occurred to me—and I throw it out as a suggestion only—that a durable composite mortar block could be constructed, the lower half of concrete up to the ground line, the upper half (6 feet) of wood block on end, this block to be anchor-bolted to the concrete.

This would secure solidity, would escape the excessive rigidity, and would permit renewal of the wood work at reasonable expense.

Guides.—Use the individual iron guide—guides without the wood bushing.

The stem will not be worn by rubbing directly against the cast iron guide with $\frac{1}{16}$ of an inch play on either side. Oil sparingly, say once a fortnight, by just touching the stem with waste moistened with a good quality of machine oil.

There are iron guides with wood bushings; but I have never seen one worth buying. It would be well to have the cap-piece of malleable iron and the bed-piece should be 2 inches thick to avoid breakage.

With the old-fashioned oak guides there is too much friction, too much wear from burning—in a few months the shoe won't center on the die.

With the individual iron guide the stems will keep cool. With the oak guide the stems are always warm and often hot. Heat means friction.

Screens.—I prefer the tin costing ¼ cent per ton crushed. Neither Russia iron, brass wire nor steel can compete with this. Put strips of ¾-inch wide of $\frac{1}{32}$ cheap rubber sheet packing between the tin and the wood frame and you will at least double the life of the tin screen. Before using, burn off the tin over a clear forge fire—just heat to redness, keeping the screen moving to and fro over the fire—this anneals and toughens the iron.

The three commercial sizes are: No. 0 = No. 8 needle; 441 holes to square inch. No. 1 = No. 7 needle; 324 holes to square inch. No. 2 = No. 4 needle; 225 holes to square inch.

No. 3 is too coarse for quartz.

If manufacturers would punch a size between the No. 0 and No. 1 and also a size a trifle coarser than No. 2, the range of tin screens would cover nearly all cases of quartz milling. The screen should have a selvage finish at both ends.

Liners.—Mortar liners removable at every clean up. The main back liner instead of being in one piece should be cut so as to give a lower piece of same width as the front liner.

Skylights.—Nearly every large mill is dark in the middle; none need or should be. Builders depend too much upon side wall windows. One skylight in the roof is better than four side wall windows. Fig. 4 shows a cheap skylight set flush with the shakes which I have used successfully even in heavy snow countries on half pitch roofs. The glass was ordinary 21-ounce plain. It won't leak and the snow slides over it. Whitewash walls and ceiling. Have a well lighted mill day and night.

Warmth of Building.—The plate and concentrator rooms should be built so as to be warm in winter season. Never have a draughty mill, icicles and plate amalgamation won't gee. A few dollars spent in tarred paper on the walls will be a wise investment in cold countries. A generous stove with a couple of hot air drums, 10 feet long by 30 inches in diameter, will prove economical of wood and keep a 20-stamp mill building comfortable and fit for amalgamation.

The items of light and warmth are not luxuries; they are the necessaries of the business.

Tables.—Tables should be heavy and solid. These flimsy tables made of thin boards and light scantling get out of whack. Figs. 2 and 3 show a table fastened to the the floor which to my notion has advantages over the rolling table. Ordinarily, 12 feet long by 5 feet wide will suffice; 10 feet of this is nailed to the floor; the 30-inch apron is removable to allow setting in shoes and dies.

The frame of three 4x6 inches by 10 feet dressed on upper edge and notched down ½ inch every 2 feet. The boards 1½ inches thick, 2 feet wide, 5 feet long, dressed on upper side, edges and ends. After dressing true, cross plane the board so that there shall be a fall of $\frac{1}{16}$ inch from ends to center. Each board is butted snug to the one next above it, and nailed or screwed to the 4x6-inch, the ends of the boards being flush with the outer edge of the outside 4x6-inch. The side rail is a plank 1½x10 inches nailed against the side of the 4x6-inch and forming a tight joint against the ends of the boards. To prevent leaking, bruise the edges of the boards with a blunt chisel, the blade 2 or 3 inches wide and ¼ inch thick. As soon as the table is wet these bruises swell.

At foot of table a double drain box with sheet iron flap. While mill is running the pulp flows into box (a), thence to concentrators through a 2-inch pipe, the end of the pipe projecting ½ inch above the bottom of the box (a)—thus forming sufficient quicksilver trap. When brushing up, the flap is lowered and the washings go over into box (b), whence they overflow through notches into box (a).

These double drain boxes will, under careful milling, recover $25 to $50 per month in amalgam which would otherwise be swamped in the concentrates or lost in the canyon. Under slipshod milling this box catchment might easily pay the mill payroll. This for twenty stamps.

Sketch shows the splashboard arrangement, Fig. 2.

By using a lip plate 17 inches wide, set on grade of

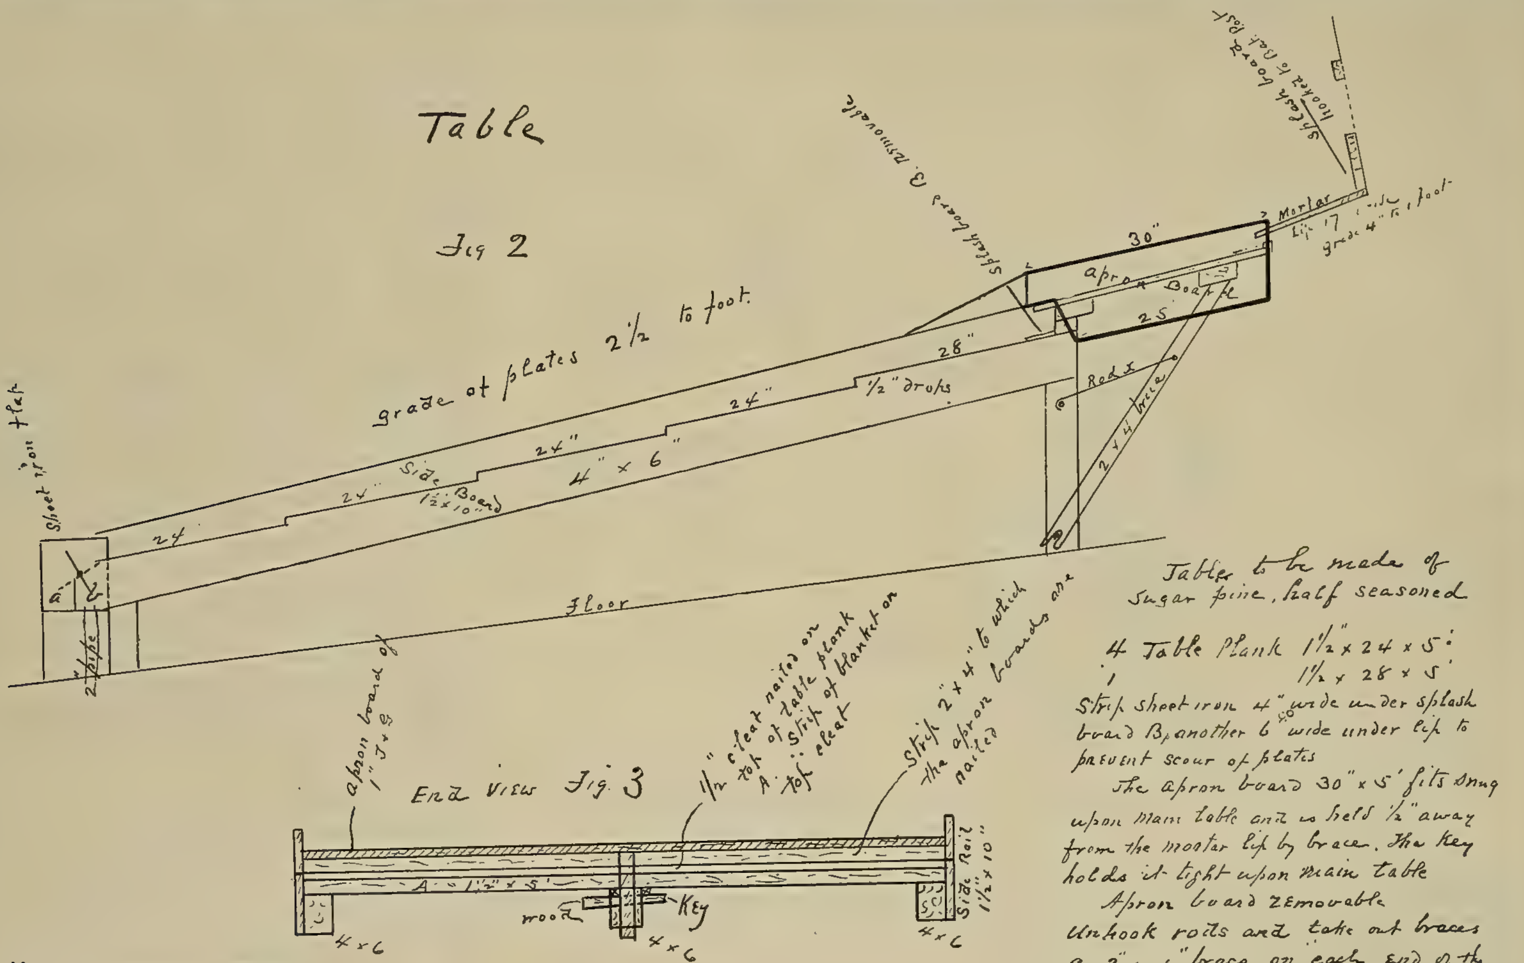
4 inches to the foot, there will be no clogging with sand and sulphurets, and the amalgam catchment will be heavy. Foundries will ordinarily cast a mortar with 1½ inches to foot grade on the lip. This will surely clog and prevent the amalgam from catching on the lip plate.

Let the pulp drop from the mortar lip (usually 1½ to 3-inch drop) upon a sheet iron strip 6 inches wide, whence it flows upon the copper plate. A drop of over ½ inch will scour the silver. Under the splashboard B is 4-inch strip of sheet iron over the plate to prevent scour.

LAUNDERS.—If of wood, let them be V shape, set to grade of 1½ inches to foot.

ROCK BREAKERS.—Every mill should have two rock breakers, coarse and fine. Set the jaws of the coarse breaker 4 inches apart, so that a sledge can slide through, thereby avoiding the breaking of the pitman or side rods. Dump all the ore, coarse and fine, as it comes from the mine, directly into this large breaker. The mixing of fine with coarse prolongs the life of the jaws. The crushed ore to pass over a grizzly—the fines going to the feeders, the coarse to be crushed in a second breaker. Manganese jaws are the most durable. Same material for mortar liners.

GRIZZLY.—Grizzlies often give much trouble by clogging—the rock begins to build against the thimbles. The most satisfactory that I have ever used is made of 12 or 16-pound T rail, downside up, bars 6 to 8 feet long, 1¼ inches apart, at an angle of 42° to 45°, the lower end of the rails rolled over, thus: (See Fig. 5.) If not over 8 feet long, it will be unnecessary to use a middle bar with its thimbles. The steep grade will give a fine product—there will be only occasional clogging.



Tables to be made of Sugar pine, half seasoned

4 Table Plank 1½ x 24 x 5'
1 1½ x 28 x 5'

Strip sheet iron 4" wide under splash board B, another 6" wide under lip to prevent scour of plates

The apron board 30" x 5' fits snug upon main table and is held ½" away from the mortar lip by brace. The key holds it tight upon main table

Apron board removable

Unhook rods and take out braces

a 2" x 4" brace on each end of the apron board

MINING AND SCIENTIFIC PRESS

So much for the working tools. Try for a mill site with plenty of fall—not less than 55 feet from track level to concentrator floor; better 75 feet. Heavy duty is exacted. Machinery is sure to break, therefore the working parts must be accessible.

MILLING.—I hold fast to four central ideas: First—On free gold ores the mortar has the two functions of crushing and of amalgamating. Second—On ores running less than $12 per ton the method used must be such as to extract practically all the recoverable gold. We will not now discuss $40 ore. If such is your luck, you may do quite as you please—either you will get rich and quit or the ore will quit. Third—If the ore is hard enough to require a rock breaker, build a heavy stamp mill, otherwise you may use one of the various rotary mills. Fourth—Do not skimp on rock breakers. It is the cheapest initial crushing; one to the mill not enough.

There is a good deal said nowadays about high duty of the mill, i. e., large crushing. Directors relish five and one-half tons to the stamp and superintendents do not object to this high duty, because it insures low costs per ton to their mining and milling record.

I believe in getting through all possible, consistent with full recovery of the gold. I can not bow down and worship a given type of mortar merely because it is a rapid crusher. High duty should mean low tailings.

The narrow, straight-back mortar, with low discharge, is not a new idea. The foundries are full of old patterns of this type. All our cement gravel mills are so built. For myself I can not escape the conviction that it is not enough to crush rock; one must also catch gold. I am constrained by my own experiments to believe that many are enjoying high-grade tailings because they sacrifice amalgamation to crushing.

Taking up now seriatim these four captions:

THE MORTAR HAS THE TWO FUNCTIONS OF CRUSHING AND AMALGAMATION.—Gold amalgam is a slippery eel—it rolls and floats unless fairly treated. Give it a show and it will settle in the mortar. It is not so hard to catch fine gold inside the mortar if the mortar is built for that purpose. So that I should say the limit of crushing in a given mortar must be measured by the percentage of inside amalgamation, except, however, on ores carrying values of $1 to $1.50 per ton of fine light gold. The aim should be to increase the inside catchment—keep it above 60%. The tendency of stamping is to combine the gold with the mercury. It is natural that this amalgam should stay inside; and it will unless the millman sets to to expel it in his scramble after a high-crushing duty.

EXTRACT PRACTICALLY ALL THE RECOVERABLE GOLD.—Whoever has used quicksilver has lost gold. Whoever has crushed ore has had uncrushed particles of sand carry (stowed away inside the particles) some atoms of gold. Therefore, tailings must assay something. It is a commercial question. You may be able to afford some loss in order to get through a larger tonnage. To illustrate:

Preparing a tailings sample for assay by screening through a 40-mesh screen, we find that 2% of the sand rests on the screen, and the fire assay shows values of 5 cents or 10 cents per ton in the fine sands and $1.50 per ton in the coarse.

The results may be tabulated:

98 tons @	5c. = $4 90	or @ 10c. =	$9 80
2 tons @ $1 50 =	3 00		3 00
100 tons	= $7 90		= $12 80

i. e., 8 cents to 13 cents per ton.

I am quoting actual results, not giving theories. The crushing was at the rate of 3 tons per stamp through No. 2 tin screen.

This 2% coarse sand could have been saved by using No. 1 tin, but it would have been at reduced crushing tonnage and would have shaved close to the sliming danger.

I call this extracting practically all the recoverable gold. And I should say it would be business suicide to jump this crushing to 5½ tons and the tailings to 75 cents per ton. I would call it suicide, regardless of whether there were 10,000 or 10,000,000 tons in the mine.

USE STAMP MILLS ON QUARTZ.—I suppose that somebody will invent a better machine than the California quartz mill for smashing rock and catching gold. It has its faults, and yet its much condemned sliming tendency is too often the fault of the millman. Somehow I like it, because it is a simple, relentless, conscientious brute, with fewer faults than cling to many of its operators.

If you want to stir mud buy a coffee mill and stir it. But if you have rock to crush, build a heavy California stamp mill with the shoe 9½ inches and the die 9¾ inches diameter—the whole stamp weighing 1100 pounds—10½ inches from center to center of stems. The ends of the mortar, after the liners are in, should be flush with the screen opening.

I have heard more than one man assert that his ore did not require a heavy stamp; but I have always found that the man had never had the luck to try the two weights on the same ore. If his ore on one mine happened to be harder than at another he would endeavor to effect a cure by giving more drop to his light stamp. If the rock still resisted and the stamp bounced, he would settle back on the excuse that he had very hard ore, for which misfortune he was not responsible.

My own luck has been different. I have had an 850-pound and a 1100-pound stamp on the same line shaft and identical ore. The former crushed 1¼ to 1½ tons per stamp and the latter 3 to 4 tons per stamp. The little fellows could not get away with the job, no matter what drop I gave them.

I may be all wrong. I am still open to conviction. But my present frame of mind is that my church is founded upon more solid rock than is the light stamp theorist's. I am through with theorizing.

Now, then, how fast shall we run this heavy mill? What drop?

We are mixing in with factors that belong to plate amalgamation, of which I shall speak later.

I want a heavy stamp because I don't want to waste time breaking rock. I want a shoe and die of large area so as to embrace many pieces of rock at every blow. If you reduce the crushing area from 9¾ inches to 8 inches you are compelled to make up the deficit by speed or long drop.

Bring a sledge whack upon a bowlder. If you don't break it you hit harder the next lick. You don't hit oftener unless you get mad and so make a fool of yourself. Probably you will strike slower—you get there by muscle, not by agility.

So it must be with a stamp mill. Stamp crushing is not a question of spalling rock—it is to crush and amalgamate ore that has been, as it were, already spalled by the rock breaker.

It happens that I am now running a mill upon unusually tough, hard ore—first-class road metal some of it. And this is what I find: With a speed of 92 to 94, and a drop of 6 inches to 7 inches, an 1100-pound stamp will crush about eighty tons in twenty-eight days, and save all the gold. Increase the speed to 100 to 102, and the drop to 8 inches to 9 inches this same stamp will crush about 110 tons in twenty-eight days, and by no means save all the gold.

So, then, my rule is to get weight and area of stamp, so as not to waste time, and to drop as the tailings assays dictate.

High speed means more wear and tear, hot boxes, greater percentage of breakdowns. If you can reach the limit of profitable amalgamation by a slower speed why not do it?

Railroad men run trains 14 to 18 miles an hour, not because they are regardful of your neck, but because they save wear and tear of rolling stock.

I have never run a stamp heavier than 1120 pounds, and from what I have learned and been told I am not aching for any greater weight.

I have found it easy to crush more than I can amalgamate. It is for this reason that I am unable to give assent to the theory of installing a system of rolls and crushers so as to deliver a cracked corn product to the stamps. For some mysterious reason there is benefit to amalgamation by churning rock in a mortar. I am no sufferer if it does take a little more time in the making of the butter. If the mine needs more stamps buy them.

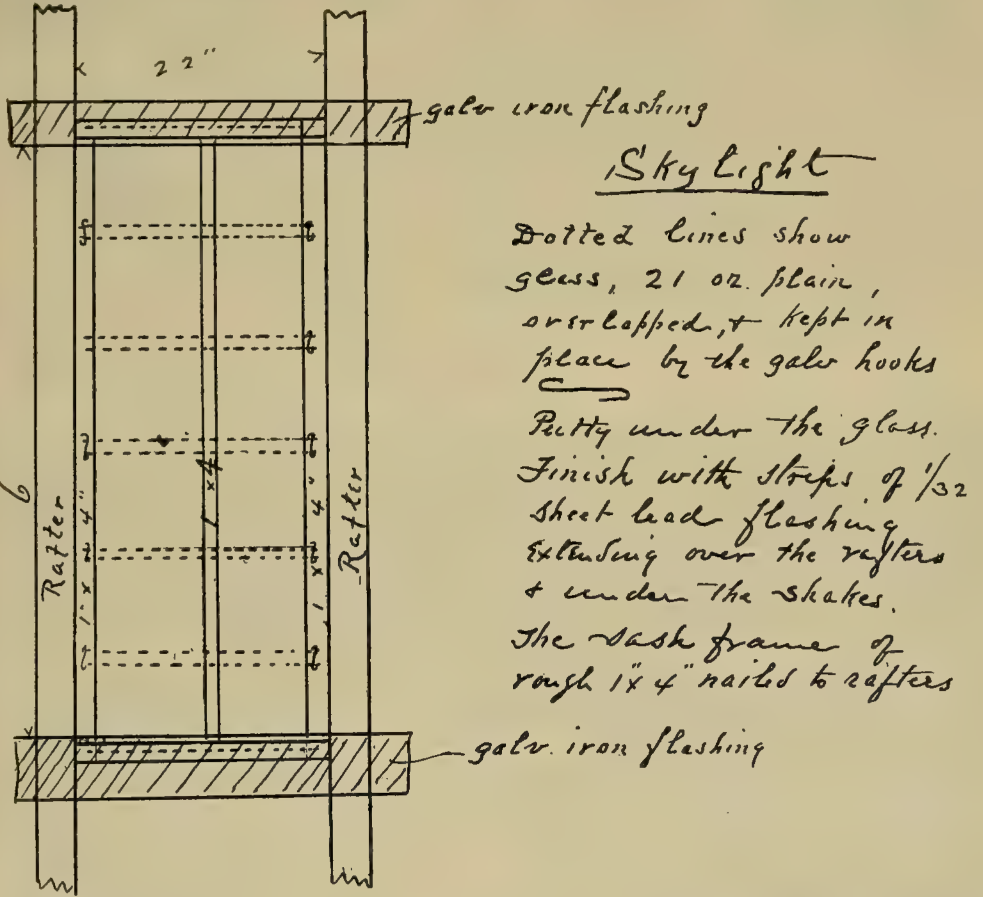


Fig. 4

MINING AND SCIENTIFIC PRESS

Before a 5-stamp battery 5 feet width of plate seems to be the practical limit. Six feet is too wide, and 5 will give better results than 4.

I have tried a launder before ten stamps, the pulp being thence passed to three tables each 4 feet wide. This was a failure. By no adjustment of gates and water could even distribution and flow be obtained. One table was all sand and another all slimes. The wave, the crescent bow, was not there.

Don't skimp on rock breakers. One breaker to the mill is the rule, and ordinarily this means that much of the ore going into the feeders will not pass a 2½-inch ring. It would not cost much to cut this product to 1-inch ring size, and a very noticeable increase in crushing will result. With a 1-inch ring product there will be fewer broken stems and consequent delays.

I have a 12x16-inch jaw crusher, into which is fed all the ore as dumped from the cars; thence the coarse rock from the grizzly is fed into a No. 1 Gates or 8x12 Blake. We have twenty stamps, one millman and one rock-breaker man on each shift. These two rock-breaker men you must have, as they assist the millman, look after the sulphurets, etc.

By way of illustration here is the rock-breaker water time for two weeks:

	Water bill.
12x16-inch ran 38 hours	$2.64
Gates or Blake ran 54 hours	3.84
Total	$6.48

Tons crushed, 937.

Here, then, are two men standing each a 12-hour shift, equals 336 hours in the fortnight; 92 hours of the 336 they were running rock breakers. Evidently these men have time to eat and to attend to other duties.

The rock-breaker end of the mill is too much neglected. One is not enough to any mill. On the other hand, I see no gain in going to the other extreme of too minute rock-breaker crushing.

Let us now cut deeper into the matter:

Catch the gold close to the die.

Don't use chock-blocks or inside coppers.

Don't slime by too fine crushing.

Don't crowd tables with too much pulp.

Don't sluice the pulp over the plates.

Don't add water outside the mortars.

Don't be afraid of steep grade to tables.

No distributing boxes.

Don't turn all the pulp on one-half the plate area when brushing up.

Don't scrape plates with chisel or rubber. Rub up with a cotton cloth and tepid water. Lip plate, however, is scraped off monthly with a chisel.

Feed quicksilver so carefully that never a globule of free quick appears on the plates.

Feed low; i. e., regulate the feeder so that the shoe is kept just cushioning on the die.

Run the batteries with the splash and not with the wave motion.; i. e., lift the shoe above the water at every blow.

Use automatic sampler on tailings.

Avoid the use of acids and cyanide on plates; common lye will cut grease.

Keep the quicksilver clean by retorting and then washing well with dry lime—follow this treatment with thorough washing in clean water.

Use well silvered plates. When they turn green, replate them, and don't waste time and gold over nostrums.

CATCH THE GOLD CLOSE TO THE DIE.—This requires a roomy, rather than a narrow mortar. You can't churn butter in a teacup, and you must churn if you want to amalgamate. I am now using two styles, both 1100-pound batteries. There is no difference in crushing, but the Fig. 1 mortar invariably makes the larger inside catchment. The other mortar is straight back.

It is a pretty safe rule to grab $20 when you see it, provided you can do it conscientiously. If you don't, something else will. I have found that whenever I neglect my inside catchment the tailings run up. Set the discharge too low and the mortar will throw out on the plates. It is the province of the plates to catch the fine gold, not the coarse. Coarse gold will roll down hill, and the table is a downhill proposition. Coarse gold makes good sized bits of amalgam, and the natural habitat of these is inside the mortar.

I should say that on quartz the discharge must not be less than 5¼ inches at the start, i. e., 5¼ inches depth of water measured from the top of the die to the bottom of the screen opening. Starting with this you will soon have 5¾ inches discharge. We will say now that the wear of the die is 2 inches in twenty-eight days. This would mean 7¼ inches discharge at close of the run, and would diminish the crushing.

To cure this make one screen frame with 3-inch strip on bottom and 2 inches on top edge; make another screen with a 1-inch strip on bottom.

As the run progresses you can change and turn screens so as to preserve a practically uniform discharge.

The drop is regulated by the tappet.

There is no harm in using a 6½ to 7½-inch discharge. But there is no gain to amalgamation, and you diminish the crushing capacity of the mill. In other words, work so as to obey the injunction, "Get through all possible consistent with full recovery of the gold."

Some interesting experiments were made at the Utica and Gwin mines on mortar shapes for 900-pound stamps. The back of the mortar was straightened to 77°. At the discharge line the distance from shoe to back is 2¼ inches and to screen 5½ inches. It was found that this mortar would crush 5 to 5½ tons to the stamp on Utica and Gwin ores, whereas the wide mortar crushed 4 to 4¼ tons—this with No. 2 tin.

I attempted to apply these lines to an 1100-pound mill, but did not increase the crushing, and can only attribute the failure to the fact that the heavier and larger shoe makes a more vicious splash. You can not bring the screen closer than 7½ inches to the shoe. On identical ore the Fig. 1 mortar will outcrush this straight back Utica mortar, and it is a better amalgamator. Outcrush it because of the greater weight and shoe area.

NO CHOCK BLOCK OR INSIDE COPPERS.—A copper plate in the mortar will attract amalgam. But copper is no greater magnet than is amalgam itself. Start a bed of amalgam in some secure cranny around the dies and you will have as eager an ally. Grooves in the liners are all humbug—they only shorten the life of the liner.

Nobody ever used a chock block but has seen it build with amalgam, and has also seen it scoured red, in whole or in spots—scoured, we are told, accidentally. Let us dissect this "accident."

Every battery is liable to be filled up with sand. Feeders fail, faucets choke, millmen yawn or are busy elsewhere—no matter the reason, true it certainly is that every battery fills up sometimes. It is this fill of sand that scours the chock block. Amalgam once scoured off, is rebellious metal—it is round and hard, it gets out on the plates where it rolls and tumbles, scorning to stick, content only when it lands in the concentrates or in the canyon. If in the canyon, it is lost for all time. If Selby happens to get a bit of it into his sample he rejects the sample as abnormal—Selby may be appropriating, he certainly is not buying abnormals. The millman blames the accident he himself has concocted—he has sandbagged himself. For the chock block lies within the zone of scour. Study this diagram Fig. 6.

Particles of gold and amalgam are flying about within the area a b c d.

These particles can be attracted upward to the chock block or downward below the line 3, 4, as you please. If you use a chock block they will fly to it. If you don't, they will sink around rocks—every particle lodged will attract another; soon it will be a mass. But note the difference; the chock block lying within the zone of scour 1, 2, 3, 4, your caught amalgam is in danger of loss. The zone 3, 4, 5, 6 being below the line of scour, your caught amalgam is safe till clean-up day. Millmen may sleep, faucets clog, feeders buck—your amalgam is safe.

Repeatedly do I find the entire front of my mortar below the line 3, 4 one mass of amalgam—cakes ¼ inch to ⅝ inch thick—this on $5 to $7 ore.

Take the year through and you will catch more gold inside without chock blocks than with them.

Another important advantage is that in case of overfeed of quick this excess will be safely absorbed by the mass of amalgam around the dies. Excess of quick on a chock block is fatal—it sloughs off the amalgam.

When one considers the varied duties of the millman and the sudden variations of gold ores there is full warrant for abandoning the chock block.

DON'T SLIME BY TOO FINE CRUSHING.—Especially vicious is this practice on slate ores. The correction can only be located by assaying the tailings through different meshes.

If you slime, you are also wasting power by dead, i. e., useless stamping.

Don't crowd plates with too much pulp.

Don't sluice the pulp over the plates.

Don't be afraid of steep tables.

No distributing boxes.

Don't add water outside the mortar.

These five may be treated together.

It is not easy to set down in words just what the conditions of the pulp should be. It is a question to be determined by the eye. When you run up against a millman who says he can run his mill by ear, fire him. Sand does not make much noise as it flows over tables.

Perhaps if you will let the mind dwell upon these negatives, some idea of my meaning may be realized.

Plate amalgamation and ground sluicing are two different arts. Gold is caught on plates because gravity settles the metal to the silvered surface. Therefore, don't be in such hurry to get rid of the sand, and try not to throw obstacles in the way of the laws of gravity. Gold and mercury have their full share of specific gravity, but upset the conditions and you easily offset this factor.

The pulp must not be too thick on the plates—you don't want a double deck of sand. Furthermore, there should be an even flow of water over the entire plate area. It is for this reason that the center of my plate is 1/16-inch below the edges—to draw the water away from the edges. Batteries tend to a greater discharge in the corners than in the center. It is a common sight to find a rush of water 4 inches to 6 inches wide along both edges of the table—one-fifth to one-fourth of the plate area is overflooded.

Many mills have tables 24 feet long with no break in grade. Drop a cork chip at the head of such table, and at the same instant another chip at the middle. You will find that the second cork will travel its 12 feet in less time than the first one, because the velocity of flow must be accelerated on such a table. If the flow is correct for the first 12 feet, it must be wrong for the second 12 feet.

It goes without saying that tables should be of the same width from top to bottom.

The sand should move over the plates slowly and evenly; the water will go in waves or pulses, while the sand below it will be kicked along by these successive waves, not moving any faster over the last 2 feet than it does over the first 2 feet of the table. Between the waves the sand almost, but not quite, comes to a standstill. Note this point especially: The sand is kicked along; it must never be swept along by a heavy flow of water.

Have a wave and use it. It is these successive kicks that tumbles the sand about; before the last plate is reached the gold is kicked into its proper place, viz: to some sticking point. The ½-inch drop every 2 feet assists the process in two ways: (a) the drop bowls the particles over; (b) it prevents acceleration of flow.

With this thin, carefully regulated flow and a sticky, pasty plate, good amalgamation will be had.

One reason for the excessive use of water, so common, is that the table has too little grade.

The millwright turns over a table 1¼-inch to 1½-inch grade to the foot. It should be 2½-inch to 2¾-inch.

Don't be afraid of steep grades, for it means less water and clean table; no danger of scour.

Distributing boxes are an abomination. The holes get plugged up; they incite the millman to careless use of quicksilver when rubbing up; they are traps to gather quicksilver, and let it out in lumps on the plates; they don't distribute pulp as evenly as the plain splash board (Fig. 2).

Globules of free quicksilver on the plates should never be tolerated. If there is a distributing box the millman can lay the blame to the box. Take away the box and rob him of his excuse.

Don't add water outside the mortar. I think one needs just the same amount of water inside the mortar as out, and I know of no better guide as to how much water to use in the mortar than to use just enough as will move the pulp properly over the plates. No reliance can be placed upon stated formula of so many gallons per ton of ore.

I regard this point of quantity of water as vital, and so far as my observation has gone nine millmen in ten use too much. Not one of these nine will agree with me in this—which only shows how obstinate men can be.

Don't turn all the pulp on half the plate area when brushing up.

We have all seen the 4-foot plate with partition strip in center. The battery is not hung up when brushing the plates, but all the pulp is turned to one side of the strip, while the men are working on the opposite side.

It seems to me there can be no logical defense for this custom. If 4 feet width is needed at any moment, it is for all the moments. To confine all the flow to 2 feet width must inevitably scour. The only excuse urged is that it does not pay to hang up. I hardly think it pays any better to scour—the richer the ore the greater the loss. Build another battery if the mine will stand it. The average mine will survive the shock of a little hanging up.

The champions of the never-hang-up theory seldom, if ever, sample tailings when brushing up. They don't know their own losses. It is a well-known fact that upon ore of only $8 value the plates just before brushing up will be plentifully sprinkled with coarse bits of amalgam barely hanging on against the flow. I suggest, by way of proof, that three tailings samples be taken from the 4-foot plate width within the ten minutes preceding the rubbing up, and then three samples from the 2-foot plate width during the ten minutes of rubbing up. Do this for thirty days, making careful assays of all the samples. Note the per cent of assays abnormally high due to particles of amalgam.

I hold that it is not sufficient to reply that what is lost in amalgam is recovered in the concentrates.

Every concentrator passes more or less of amalgam and mercury over into the tail race.

Don't scrape main plates with chisels.

No globules of free quicksilver on plates.

It is essential to keep a well silvered surface, sticky and pasty. The apron plate may require replating every three or four months. The lower plates should wear several years. The cost of replating varies with the ore. I have found it amounts to 1 to 1½ cents per ton crushed, using a plating of three ounces silver per square foot of plate.

I take off every morning the excess of amalgam, but never skin it closely. Rub up with a piece of cotton domestic several folds thick, sprinkling the plate with quick from a small shaking bottle. I have seen used a beer bottle with quill through the cork; but this wholesale fashion of sousing quicksilver on a plate is malpractice. Use a small vaseline jar with a piece of cotton tied taut over the mouth; clear, tepid water in a kettle to dip the rag in frequently. Rub the plate briskly and thoroughly, being careful every day to remove all blisters of amalgam. These blisters eat out the silver, and therefore should not be permitted to form. In cold weather they are especially troublesome. If they stick too tight for the rag, they may be gently scraped off with a piece of No. 24 stove pipe iron shaped like a flat scoop 2 inches wide. Do not use a steel chisel. Finish with a final light sprinkling from the jar and thorough rubbing with the cotton rag, then brush over with a whisk broom.

Fig 5

MINING AND SCIENTIFIC PRESS.

The lip plates are never softened with quicksilver, but are every morning brushed off, or rather scrubbed off with the broom to clean out the sulphurets. The lips will stand a good stiff brushing daily.

At 4 o'clock P. M. and at midnight my plates are again rubbed up, but no amalgam is taken off at these times. It therefore takes only a few moments for these two rubbings. I find that my running time on a 20-stamp mill is twenty-three hours daily because of this careful plate treatment.

There are never any globules of free quicksilver on the plates, top or bottom. If the ore is lean, we feed less in the battery and the rubbing up is so carefully done that it never leaves drops of quicksilver on the plates.

The quicksilver fed is weighed at every shift in troy ounces and a daily record kept. I never weigh out an allowance to my millmen. They know what is expected and careless work reveals itself immediately on a plate. At clean-up there should be little or no free quicksilver in the mortars around the dies.

Battery water at 55° Fahr. will give good results. It is essential not to have sudden changes. I never saw a reliable mechanical heater. Perhaps, where oil is cheap, the incubator racket would work.

I rely upon keeping the plate room warm because I am afraid of the sloughing off of amalgam, which inevitably follows a sudden rise of 20° to 30° of the water. I am still studying on the problem to keep the water uniformly at 65°.

AUTOMATIC SAMPLING.—The custom of sampling tailings with a dipper by hand every half hour, more or less, has but little to commend it.

It is to the owner's interest to know exactly what the tailings assay. It is to the millman's interest to keep the tailings low.

The hand sampler will soon learn how to sample judiciously from his point of view.

Nobody can coach an automatic sampler driven by machinery.

It is absurd to take off the sample by hand from the tail of the vanner.

There are several kinds of excellent automatic samplers in use which I will not take the time to describe. However the sample be taken, it should be evaporated to dryness for the assayer. Do not pour off the clear water; you may use a siphon.

CLEAN-UP APPARATUS. — To clean up I use: A wooden trough 5x2x2 feet; a man with the hoe; a '49 rocker 4 feet long by 16 inches wide; a clean-up board 5 feet long by 12 inches wide, with 3-inch side rails, covered with a silvered plate; a buck and a wedgewood mortar; a small iron screen ⅛-inch mesh.

Into the trough throw all the mortar dirt; sprinkle freely with quicksilver; turn in boiling hot water; then hoe the mass about thoroughly with hoe and strong four-tined rake so as to break up all lumps. The dirt is then rocked out and the resultant amalgam, iron scraps and fine sands dumped upon the clean-up board and the sand washed out with a hose stream. The iron is taken out by magnet. Grind the amalgam a few minutes in the buck mortar; rewash on the board, giving a final bath of quicksilver in a wedgewood mortar to skim off the dross. To make sure there are no lumps or bits of iron, copper or brass, strain through the ⅛-inch screen and regrind the lumps.

I venture the assertion that by this process two men will in two hours clean up a 20-stamp mill and leave not over $50 in the sands.

These sands are, of course, put back in the batteries at the following run.

I would clean up a 100 or a 500-stamp mill by the same process, except that the mixing would be done by what the macadamizing men call a "rattler" or revolving trommel. Rattler and rocker to be driven by power.

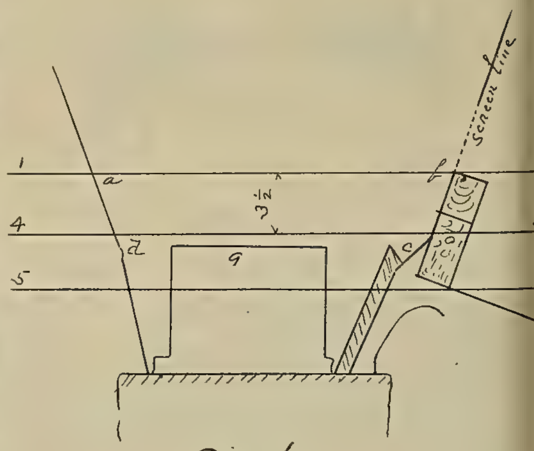

Fig. 6

Clean-up barrels and pans flour quicksilver and thereby entail unnecessary losses of gold.

The clean-up room should have a cement floor. All wash water should pass into settling boxes or tanks.

CONCENTRATORS. — Concentration is too broad a question to be discussed here; so much depends upon the characteristics of the metals and the gangues.

In too many mills the crew is inadequate, so that both batteries and vanners suffer alternately, as the solitary millman trots up and down stairs vainly attempting to straddle too much job. I never saw a dozen belt vanners in any mill all working right for over five minutes at a time. This may sound like an exaggeration or a confession of bad luck; in point of fact, it is merely naked truth.

For the average gold mill the concentrator question may be summed up in the rough about thus: Buy one that is not over-sensitive; there is a wide difference in this respect between the various belt vanners; don't pay much heed to the advertised competitive tests.

It is because of their extreme sensitiveness to variance of load or water that I am disposed to think that the reign of the belt vanner is about over.

What is wanted is a machine with some common sense—one that won't kick and go awry at every little variance of pulp.

The belt vanner is about as helpless as an infant; it seems to require some experienced old hen camped alongside it all the time. That's the way the makers conduct their misleading competitive tests. The trouble is there is not much time for the nursery business about a stamp mill.

The Wilfley concentrator requires a heavy load to do effective work—twenty to forty tons. Consequently, there would seem to be no room for it in a 5-stamp mill. Possibly a smaller table would scale down to, say, a 10-ton load. Manifestly, any concentrator with so wide a range as twenty to forty tons will not be going wrong every five minutes.

It is worthy investigation, and it is idle to object that it has no belt.

COSTS.—To close with some details of cost per ton in 20-stamp mill—based upon a year's average—16,000 tons:

Freight, $1.10 per cwt. from San Francisco.

Wages: Amalgamators, $3.50; rock-breaker men, $3.

Water power: Rock breakers	.0102
Water power: Batteries	.0884
Labor, all, including repairs	.2862
Shoes, dies, mortar liners	.0721
Oil: Light and lubricating	.0131
Replating	.0100
Sundries	.0024
Firewood (4600 feet altitude)	.0081
Rockbreaker jaws, tappets, bosses, extras.	.0130
Quicksilver loss, .145 troy ounce per ton...	.0052
Total per ton crushed	.5087

Quicksilver loss includes the mechanical losses from retorting, cleaning up, etc. Nothing phenomenal, you note. It is, however, authentic. The tailings ran from 5 cents to 20 cents. The ore at the monthly clean-ups ran from $4.75 to $10.25 per ton.

RECAPITULATION.—To recapitulate; my argument runs in about this wise:

Use a stamp mill because the sons of Adam have not as yet invented a better machine for the purpose in hand.

Use a heavy stamp because it won't waste time and can be run slow enough to save wear and yet fast enough to churn and therefore amalgamate.

Have large shoe and die areas, so as to embrace plenty of rock at every blow.

Crush and also amalgamate, the limit of your crushing to be taught by the tailings assays.

Extract all the practically recoverable gold. If more stamps are needed, build them.

The speed and drop suitable can only be determined by assaying tailings.

Catch the gold close to the die.

Renounce chock blocks.

Don't slime by too fine crushing.

Beware of too much water.

Don't crowd the plate with too much pulp.

Have the plate sticky and pasty with amalgam, and never dripping with quicksilver.

Use a broad, steep plate and hang up when rubbing up; note the use of the word rub, not wipe. Put elbow grease, and none other, on the plates.

Don't be parsimonious about replating.

Sample automatically.

Battery water temperature not below 50° Fahr.; better keep it at 65°.

Have a good mine; do these things and the great god of battle, with whom every man must reckon, will be with you.

Joshua Hendy Machine Works, San Francisco.

Few of our readers to whom the advertisements of the Joshua Hendy Machine works are familiar realize the prominence of this well known institution, ranking as it does among the largest of manufacturers of mining machinery in the West.

Years ago it became apparent to the Hendys that the larger foundries and machine shops would be compelled to leave the old district south of Market street, San Francisco, where all the pioneer foundries were located, and in their judgment they properly established a nucleus for their growing business by locating on the block bounded by Kearny, Bay, Francisco and Dupont streets, San Francisco, and opposite the sea wall.

The Hendys, having been identified with the mining industry over forty years, and having by their own efforts created a demand for their machinery, it naturally follows that their plant has reached the large proportions shown in the illustration on the front page in order to facilitate the execution of increasing orders in their various lines. The recent purchase of adjacent property will enable them to erect additional buildings and materially aid them in keeping up with the times in furnishing modern mining machinery. Their San Francisco city office is 38–44 Fremont street.

Weber Gasoline Engine Works.

On the front page of this issue appears an illustration of the main office and works of the Weber Gas & Gasoline Engine Company of Kansas City, Mo., a company closely identified with the development of the gasoline engine as applied to mining equipments, hoists and pumping outfits, turning out gasoline engines for all purposes from 1 H. P. to 100 H. P. capacity, the new plant illustrated covering a ground space of 300,000 square feet. The new factory site covers two entire city blocks, on which is built a single-story factory of stone and steel throughout, making it entirely fireproof. It is divided into five main departments devoted to gasoline engines and hoists, electric lighting engines, marine engines and automobile engines. Each department is equipped with electric cranes, by which heavy castings are handled conveniently. The power for operating these cranes is supplied by an electric plant driven by gasoline engines. Gasoline engines are used throughout the factory, separate plants being installed for the several departments, the company being thus enabled to present a practical demonstration of one of the most important advantages to be derived from the use of this class of motors. Gasoline engines are placed at convenient points and supply the power for operating machinery and tools in the different departments. The records of the company show that this is an economical arrangement.

"The Light of Genius."

TO THE EDITOR:—C. M. Fassett has an article in the issue of Oct. 20th on "The Selection of a Working Process," which is so good and sensible throughout that one is surprised to find in it a piece of advice fraught with gravest danger to the inexperienced, for whose benefit the article was evidently written. I refer to the following: "Send part of your ore to the smelters, and to any crazy scientist who, you may hear, is working on a new process. Take time to let them all have a trial at it, and remember that as no two ores are alike yours may be just the ore that is adapted to some embryotic method that will treat it succesfully. When they have solved the problem the world sees the dazzling light of genius in their eyes."

It is hardly necessary to point out that "crazy scientist" is a contradiction of terms; every mining man knows the class to whom the epithet is applied. One could hardly throw a club in the streets of San Francisco without hitting the inventor of, or the investor in, a machine or scheme that was to "revolutionize the mining industry;" yet the mining industry has never been revolutionized. Its wonderful progress has been the result of evolution, never of revolution. Mining men are constantly looking for improved methods, and finding them, too, but not in the workshops of the "crazy scientists." To advise the inexperienced mining man, in search of a process for treating his ore, to consult a "crazy scientist," or, in other terms, impracticable theorist, is to advise him to commit hari-kari.

The experienced mining man knows him by sight, or, at least, by sound; but the inexperienced is too likely to mistake the glare of insanity for the "light of genius," and present himself, a living sacrifice or a burnt offering, on the altar of "embryotic methods." With a less stretch of imagination than these theorists are generally endowed, one might almost play hop-skip-and-jump from Montana to Mexico, on the tops of smoke (less) stacks erected by "the light of genius," and abandoned by the light of experience.

There is no reasonable excuse in these days for a mine owner to make a vital mistake in selecting a method to treat his ore. If he has ore of the required formula, q × q = p (quantity × quality = profit), he can learn how to treat it successfully by consulting one or more of the great mining machinery manufacturers whose names are familiar in mining circles all over the world. And if some of these gentlemen can not advise him, even to the point of a guarantee, how to treat his ore properly, the sooner he quits that particular mine the better.

When his reduction works are completed after plans approved by experience; when the time of Irish dividends has passed; when his proposition is on velvet, and he has money for foreign missions, it will be soon enough to monkey with "the light of genius."

F. N. F.

Without assuming to speak for Mr. Fassett, who is at present in Corea, it is probable that the words "crazy scientist" in his article are not taken as a belief that the scientist is "crazy," nor are they to be assumed as suggesting that it would be good business to send part of the ore to any one who is "crazy," be he scientist or otherwise. Probably Mr. Fassett intended ironical allusion to the belief still prevalent in some quarters that men who are experimenting with ores and metallurgical processes are "crazy" in their aims and intents, while in reality they are, ofttimes, avant couriers of new metallurgical discoveries. The context of the article would seem to indicate that such was his intent, and that in that way he meant to convey brief censure on the too oft used notion that because a man in an assay office or a laboratory does not produce immediately profitable results, he must be "crazy" in his experiments and embryo processes. Probably men not knowing any better who first saw the pioneers in the cyanide process in their crude experimental work, considered them "crazy scientists," but it is from the work of such "crazy scientists" as these that much of the present mining and scientific progress is due.

Regarding the last sentence that our correspondent quotes from Mr. Fassett's article, it would appear to us that that sentence is merely another way of saying in a semi-sarcastic manner that success is the criterion of merit; that results determine what place a man shall occupy in the esteem of his fellows; and that the obscure light in which the "crazy scientist" of to-day may be working, in the event of his success may develop into a halo of light, irridating and surrounding him as a genius, when success is made manifest. The diver, as he poses to plunge, may be a pauper, but, as he emerges from the depths with a pearl, may be possessed of the wealth of a prince. And so with the scientist, the inventor, or the theorist, who, if his science, invention or theory is based upon fact, may emerge from the shadow of universal disbelief to the splendor of noon-day success, and be hailed as a "genius," because successful, yet not the less a genius before.

It is believed that from this point of view Mr. Fassett's remarks are not wholly open to the interpretation of our correspondent, though from his standpoint and construction of the meaning of the article to which he refers his position is eminently correct. The latter is certainly right in the statement that there are a great many men who never get beyond the "crazy" stage in mining and metallurgical processes, but that is because their conceptions or theories were never susceptible of successful demonstration.

There is a wholesome conclusion to be derived from our correspondent's suggestions, namely: that it were better for mine owners and operators to let others do the experimenting; to disregard anything that has not been proved to be good; and to profit by wise observation rather than costly experience.

Pyritic Smelting in the Black Hills.*

NUMBER III.

The slag and matte at Deadwood run together from the end of the furnace into a forehearth, either 3x5 or 4x4 feet in size, and 2 feet deep, where the matte settles in the bottom, while the slag overflows into large slag trucks. This forehearth is upon wheels high enough to run a matte pot under its tap hole. As fast as the matte accumulates, it is tapped from the bottom of the hearth into a pot. The forehearth is lost, usually by the accumulation of metallic iron or "sow," that raises the bottom above the tap hole. These forehearth sows are identical in composition with those formed in the interior of the furnace, and are treated in the same manner as the furnace sows. Owing to their small size, they offer no difficulty in the way of handling or breaking up. They usually weigh from 800 to 1000 pounds.

It was my theory that this metallic iron helped to clean the slags, and I did not really care to overcome its formation; but others have tried to do so. It was my theory that if the gold were not recovered in the sows, it would be lost in the slags; and here is, in my opinion, the solution of the question of clean slags in the use of iron pyrites free from copper.

The Deadwood iron matte was never a pure monosulphide, but a subsulphide carrying metallic iron, some of which could be separated as "metallics" by grinding and sifting. Traces of copper existed, while the matte always carried silver and arsenic. The traces of copper, silver and arsenic would, of couse, take it out of the experiments of Dr. Pearce, to which reference is above made; but to my mind it was the metallic iron which cleaned the slags.

In a discussion of this question before the Colorado Scientific Society, it was remarked that if Dr. Carpenter would add more pyrite, he would avoid sows. It is a question whether, with our slags, this would be the case. At Kongsberg, where pyrite is added to the smelting as we added it at Deadwood, Samuelson found that an increase in pyrite meant an increase in the metallic iron so reduced. This was our experience at Deadwood. The formation of sows could be lessened, however, by cutting down the amount of coke used, and thus lessening the reducing action of the furnace. As this invariably meant an increase in the amount of gold lost in the slags, I aimed always to make some "sow."

Before it was possible to obtain copper it was Mr. Knutzen's idea that it paid to add waste metallic iron to the charge, purposely, to make sure of the presence of metallic iron in the furnace.

I believe that a process for smelting the Siberian black sands, so that the gold might be recovered in metallic iron, was once proposed. From our experience at Deadwood, I have not the least doubt that it would have been successful. Even after we obtained the copper ores from Butte, the amount of "sow" was in no way diminished. At Mansfield it has been found impossible to prevent the formation of these sows, although there they serve no possible purpose unless it be to collect the small traces of nickel and cobalt in the ores. As the pyrrhotite was not known to be nickeliferous, I often intended to have our "sows" tested for nickel, but never did so.

The percentage of matte made at Deadwood is very low, seldom exceeding 5% of the weight of the charge, and formerly sometimes fell to 2% or 3%; and here I wish to note a peculiar experience. Before the use of copper we could not always control the percentage of matte to be made. Sometimes almost the whole of the iron would go into the slags, and no matte would be made. At such times one would expect that the slags would carry the whole of the gold, but such was not the case. They were not noticeably more foul than at other times. I note one run of eighteen hours without matte, while it was common for hours to pass with little or no matte appearing. "Sow" was doubtless formed, but, if so, it remained in the furnace, and with it the gold.

In the Altai mountains, where pyritic smelting is practiced (I use the term "pyritic smelting" always in the sense in which Percy first used it), the matte frequently falls to 2% or 3%. We found the matte, however, much richer than usual, and I have made iron matte at such times exceeding twenty-five ounces of gold per ton. I am strongly of the opinion that, if the reduction of iron can be controlled in this form of smelting gold ores, copper may be disregarded, especially when it is handled at a great loss, as at Deadwood.

Many persons have supposed that these high-silica slags are made only at a high formation temperature. Prof. Hofman, in a most valuable paper, has recently investigated the temperatures at which certain silicates are formed. In one series he gives the result of the addition of silica the ordinary slag of the lead smelter. He adds silica by regular steps, and plats the result in a curve. The formation point from 0.5 to 1.25 silicate degrees shows hardly any variation. The slags are formed at about 1180° C. The formation temperature then falls off rather rapidly until the bisilicate (2) is reached, and then less rapidly to a point half way between the 2½ and the trisilicate (3). After the trisilicate, which is formed at a much lower temperature than the monosilicate, the curve rises very rapidly. At the basic end, however, the slags, he says, are very fluid, and melt down very rapidly, while toward the acid end they melt down rather slowly and are far from fluid, notwithstanding their low formation temperature.

(TO BE CONTINUED.)

---

*F. R. Carpenter, August Meeting, 1900, Transactions A. I. M. E.

Oil and Gas Yielding Formations of California.

NUMBER II.

The official State bulletin shortly to appear will contain much of value to California oil men. In it W. H. Watts says:

The oldest rocks exposed in the Sunset oil district consist of sandstone, calcareo-siliceous rocks and impure limestone, dark-colored shales, massive light-colored shales—showing a hackly fracture—strata of sandstone with rounded concretions, calcareous sandstone, and fine calcareous conglomerate. The exposures of formation are scarce, and the few that exist show great geological disturbance. Within short distances the strata frequently dip in opposite directions and at different angles of inclination; the prevailing dip, however, appears to be northeasterly. This formation yields springs of sulphuretted brines, and in one place a small quantity of greenish oil accompanies the brine, but no calareous tufa nor any solid bituminous deposit is formed. No fossils were found in these strata. The most characteristic features of this formation are the dark-colored argillaceous shales, and the sandstone containing rounded concretions. The stratigraphical position and the physical character of this formation warrant the assumption that it belongs to the same geological horizon as do the Eocene shales and sandstones underlying the light-colored siliceous shales in the oil district 9 miles north of Coalinga, in Fresno county. Overlying the formations, which we may tentatively class as Eocene, in the Sunset district is a formation composed mainly of light-colored siliceous shales and constituting the first tier of foothills. These shales are for the most part of a brownish color when first mined, but they become almost white under the action of the atmosphere; indeed, the outcroppings of this rock are white or light-colored for several feet beneath the surface. In places the bleaching of these shales can be traced directly to the action of sulphuretted vapor.

The light-colored siliceous shale is by far the most characteristic rock of the bituminous formations. Much of it is of low specific gravity and porous, sticking readily to the tongue, and is easily scratched. Some of it, however, especially in the lower portion of the formation, is indurated, apparently by the infiltration of siliceous water. Occasionally pieces of this shale are found which show siliceous induration only in the outer portions of the laminæ of which it is composed; a cross-fracture reveals soft, light-colored shale within.

The chemical composition of these shales is as interesting as their physical appearance, the characteristic feature being the large amount of silica they contain. Two specimens from the Sunset oil district were examined which showed as follows:

	Insoluble in acid.	Silica soluble in sodium carbonate.	Total amount of silica.
	%	%	%
(a)....	99	12	98
(b)....	92	24	89

The light-colored shales are much less disturbed than the formation on which they rest. The prevailing direction of the dip of the light-colored shales in the Sunset oil district is N. 30° E., and the angle of inclination is in some places as low as 20°, while in others it is as high as 80°. Although the southern limit of the light-colored shale in the district is tolerably well defined, it is not unlikely that in some places, where this shale has escaped erosion, it may extend a long way up the northeastern slope of the coast ranges. In one instance a well was dug at an altitude of nearly 3000 feet, in which light-colored shales, similar in appearance to those found in the lower foothills, were penetrated.

Investigations in various parts of the Coast Range warrant the classification of these shales as Lower Neocene (Miocene). There is reason to believe that they rest non-conformably on the underlying rocks.

Numerous seepages of heavy petroleum exude from these shales, forming beds of asphaltum, which, in some places, before these deposits were mined by Messrs. Jewett & Blodgett, extended over an area of several acres. This asphaltum, much of which remains, is principally black, pitch-like bitumen, varying from solid to viscous; some of it is of a yellowish brown color; it is of different degrees of purity and exists not only in beds and mounds, but was found by excavation to extend beneath the superficial drift. In some of these beds the bones of animals, stone mortars and other Indian relics were found beneath 4 or 5 feet of asphaltum.

In several places springs of brine and sulphuretted water issue from the light-colored shales.

Near Coalinga, in Fresno county, the writer found evidence of this formation resting non-conformably on the light-colored shales, and in some places it contained fragments of shale, apparently similar to the light-colored siliceous shales previously mentioned. At the Sunset oil wells and in the Coalinga district oil sands are found in the lower beds of this formation.

The record of a well drilled in S. 28, T. 11 N., R. 25 W., S. B. M., is as follows. This well was commenced with a 11½-inch casing:

	Feet.
Sulphur and apparently tufa deposited by mineral water to	45
Very hard gray and blue limestone to	80
(At a depth of 58 feet there was a little oil and mineral water.)	
Gray sandstone, with soft streaks and more mineral water, to	160
(At this depth the casing was reduced to 8⅝ ins.)	
Soft blue sandstone, with hard shells and more water, to	402
(At this depth the casing was reduced to 6⅝ ins.)	
Blue sandstone to	420
(At this depth the water was shut off.)	
Coarse sandstone, with oil and water and much gas, to	440
Light-blue sand to	445
Sand, with water, to	820

This well was cased from the depth of 420 feet to that of 820 feet with 5-inch casing. Supt. Youle states that this well was tested, and that about 100 barrels of brine and 6 barrels of oil were pumped from it daily for three months. It also furnished enough gas for a cook stove.

(TO BE CONTINUED.)

Packing Mining Machinery for Export.

On the front page is an illustration of six cases containing mining machinery and parts at the shops of the Gates Iron Works, Chicago, packed for shipment to Johannesburg, South Africa. The illustration, specially made for this paper, is of interest; the strength, security and marking will be noticed. P. W. Gates, in American Trade, says the picture shows fairly well the system and way of marking. "Every package of every consignment is numbered, and the gross and net weights, as well as the outside dimensions of the package, are given plainly on surface of box, and we usually try to put on such a surface as will be below the general or outside dimensions of the box, so that there shall be as little chance as possible of this marking being erased. We would call attention to the tin marking tag which is nailed to each box in a recess cut out below the general surface of the package. On all foreign shipments we use this form of marking; the letters on this tin tag are stamped into the tin, and consequently will remain there as long as the body of the tag lasts. In figures in the upper left-hand corner are the day and the number of the month corresponding with the date of the order, and this is done for the purpose of identifying the consignment, so that the agent or purchaser, even though he may have several consignments in his warehouse, and among these several consignments several boxes marked No. 6, or any other number, will know, by consulting this date mark in the upper left-hand corner of the tag, to which consignment this numbered package belongs."

MINING SUMMARY.

ALASKA.

Coal is reported found in Kasaan Bay, Prince of Wales Island.

Galena is said to have been found on the west side of Prince of Wales Island, assaying ten ounces silver to the ton.

Statuary marble is found on the island of Koscirishko, 2 miles square, at northern end of Prince of Wales Island.

The Kasaan Bay M. Co. has men at work on the Copper Queen and other properties on Kasaan Bay.

Swift & Co. of Chicago will probably put in a mill, water power plant and wire-rope tramway on their Cracker Jack group, Prince of Wales Island.

F. Anderson of Boston, Mass., will put men at work on six claims on Prince of Wales Island which he recently bought from R. Allison.

ARIZONA.

COCHISE COUNTY.

The Bisbee West Copper M. Co. will work property near the Copper Queen, Bisbee.

The Copper Crown of Arizona M. Co., operating property near the Dragoons, are taking out ore from the Copper Chief, and will sink a shaft on the same.

W. H. Pomeroy projects a cyanide plant at the old Grand Central mill, Fairbanks, to treat the tailings from same.

The Middlemarch Copper Co., at Middlemarch, will increase the capacity of its plant by the addition of new machinery. There are thirty men employed at present.

GRAHAM COUNTY.

W. Climo, Supt. Shannon M. Co., Clifton, reports 1000 feet of development work being done monthly.

MOJAVE COUNTY.

The 300-ton concentrator at the Tennessee, Chloride, is nearing completion. The shaft will be sunk 100 feet deeper.

C. Gracey has twenty-five men at work near El Dorado canyon on a new 25-stamp mill.

Bodegee, Spanoble & Smith are reported to have made a strike on the old Blaine, and to be taking out a ton of ore per day.

The shaft at the Occidental, now down 700 feet, will be continued to the 1000-foot level.

J. A. Halsey is shipping ore from the White Hills.

PINAL COUNTY.

The Chapin C. M. & S. Co. has bought the Grand View group (copper), 18 miles northwest of Tucson. Men will be put on and work pushed. A smelting plant may be put in.

The Milwaukee & Arizona M. Co., the Chief M. & S. Co. and the Casa Grande M. Co. are pushing work on their properties in Quijotoa district, near Casa Grande.

YAVAPAI COUNTY.

Ore from the New Year's Gift, near Prescott, runs $4 gold to the ton, and costs 30 cents per ton to mine. G. Rohpeter of Prescott owner.

The Verde King Copper Co. is pushing work on its property south of Jerome. Day and night shifts are working on the tunnel.

Owing to delay in the arrival of new hoisting machinery, work on the main shaft of the Decatur, Jerome, is delayed. A strike is reported made.

Good copper ore is opened up on the 60-foot level of the Crain mines, near Mayer.

W. J. Martin, Supt. Eclipse group, in Cherry Creek district, near Cherry, is pushing work.

At the Cash, near Senator, the shaft is down 315 feet. A 500-foot drift has been run on the 100-foot level. Drifts will also be run on the 200 and 300-foot levels; Supt., H. Blauvelt.

Ore from the north shoot of the First Home, Big Bug, carries gold, silver and lead, while that from the south shoot carries gold mainly, with but little silver and lead; Block & Gray owners.

The Blue Dick M. Co., of Cleveland, O., operating the Blue Dick and other mines in Hassayampa district, will put in a smelter on the properties.

The Cypress shaft is down 195 feet. A vein 2½ feet wide opened up at this depth.

A 10-stamp mill will be put in on the White Horse group, on Lynx creek. Men will be put on and work will be pushed.

According to a Boston paper, W. A. Clark has a proposition from the Amalgamated Copper Co.: "End this Montana warfare and we will buy of you your United Verde mine. We will give you $55,000,000 for it—one-half to be in cash and the other half in Amalgamated stock, you to devote your time in the future to that company, taking the position of president." The Boston papers assert that Mr. Clark accepted the proposition, and that, on the perfection of details and the passing of final papers, formal announcement will be made.

YUMA COUNTY.

F. Guerra has twelve men working on a group of claims in Picacho district. It is locally reported that Senator Jones of Nevada and S. Jones and H. T. Graham of New York are interested in the group, and that they will put in a 100-stamp mill.

A strike is reported in the King of Arizona district.

The Empire Copper Co., operating in Empire Flat district, project the erection of a smelter.

The Arizona Giant Copper Co., operating near Ehrenburg, are down 114 feet on the Self Defense group.

CALIFORNIA.

AMADOR COUNTY.

Repairing the Zeile, Jackson, shaft is in progress and most of the men underground have been laid off.

A strike is made at the Mutual, near Amador.

Supt. W. A. Prichard is pushing work on the Keystone and has opened up good ore on the 600-foot level. Crosscutting is in progress on the 900-foot level.

Work at the Defender is suspended indefinitely.

The new machinery at the Kirkwood is in and operations will begin Dec. 1st.

BUTTE COUNTY.

P. R. Welch proposes to tunnel under Welch hill, near Oroville, and expects to reach bedrock in a distance of 40 rods. He will use a large pump operated by electric power to keep the mine clear of water.

CALAVERAS COUNTY.

Fourteen men are working at the Demarest, near Fourth Crossing, cleaning out the shaft and extending the 300-foot level.

Sinking is in progress at the Ghost. The shaft is down 1400 feet.

Work is progressing at the Tulloch and Ophir mines.

INYO COUNTY.

Ashford & Inman have bonded the Emily Enid and Bonanza Jim mines, near Bishop.

KERN COUNTY.

The Jewett–Blodgett–Beal Co., Bakersfield, is putting up a rig on No. 2 well.

No. 1 well of the Lion Oil Co., Bakersfield, is producing sixty barrels of oil per day. A 1000-barrel storage tank is going in. A 3-inch pumping plant is also going in.

The Sunset P. & R. Co.'s No. 1 is reported flowing thirty barrels of oil per day.

The Toltec Co. has put in a rig on No. 1 well, Section 30–28–28.

LOS ANGELES COUNTY.

The Reliance Oil Co. has resumed drilling on its property on Welcome street, Los Angeles.

At Whittier the Whittier Grande Oil Co. has a new rig in and drilling will be pushed.

MARIPOSA COUNTY.

(Special Correspondence).—At the Mary Harrison mine the main shaft is now below the 900 level, and a connection on this level has been made with the winze, which is being sunk in the ore body.

Coulterville, Nov. 25.

If the ore shoot continues for the remaining 300 feet, the local management considers that it will be justified in moving the 40-stamp mill up to the mine, preparatory to resumption of gold output.

MONO COUNTY.

The Crystal Lake M. Co., the new owners of the old Lakeview & Jackson mining property, a Colorado company, are putting up an extensive milling plant on the property, near Lundy.

In the Standard Con. mine, at Bodie, for the week ending Nov. 17th, 400 tons of ore were crushed. Average assay vanner tailings, $6.50; concentrates produced, 1.17 tons; assay value, $70.71; amalgam produced, 1246 ounces; value per ounce, $3.09.

PLACER COUNTY.

The Blue Lead, Dutch Flat, only has four men working, and when the mine is opened up more will be put on.

SAN DIEGO COUNTY.

A rig will be put in on the Eummelen ranch, near Lakeside, and drilling for oil begun.

The well on the La Jolla, La Jolla, is down 160 feet.

At the Victoria, near Encinitas, drilling is being pushed.

SHASTA COUNTY.

New York reports curb trading in the stock of the Old Colony G. M. Co. last week of 1000 shares.

SISKIYOU COUNTY.

Supt. W. T. Shurtleff of the North Star, Humbug district, is pushing work. The mill is running steadily.

The old Spencer may be reopened.

Sixty men are employed at the Jillson and mill is running steadily; monthly yields average $17,000.

The La Flesh, now equipped with a 3-stamp mill, may put in a larger plant.

Manager F. Beaudrey has 150 men working on flumes, laying pipe, etc., at the Wild Cat group (hydraulic), near Callahan, and mining operations will probably begin by January.

TULARE COUNTY.

The Minnie Ellen mine, Deer Creek, has closed down on account of being filled with water.

TUOLUMNE COUNTY.

Treasurer Howard of the Pioneer G. M. Co. states that the assessment of 20 cents per share has been paid on 93,681 shares out of a total of 100,000. The stockholders who have paid their assessments have subscribed for a total of 352,492 shares of stock assessment unpaid, and there is a balance of 6319 shares. The new certificates will be ready next month.

A good body of ore is opened up on 30-foot level of the Standard, Sonora.

W. H. Barron is pushing work on a double-compartment shaft at the Parole, near Soulsbyville.

A strike is made at the Golden West, Sonora. A new 10-stamp mill is going in and a 1000-foot double-compartment shaft will be started soon.

At the Draper sixteen men are employed. New pumps are in and sinking is in progress. A mill is going in. A new mill is also going in on the Starr King, operated by same company.

Good ore is opened up on the Independence, near Sonora.

At the Draper, Carters, buildings are nearing completion. Machinery is going in and the mine will soon start up.

It is reported that the old Soulsby, Soulsbyville, may soon be reopened.

VENTURA COUNTY.

The Searchlight Oil Co., on Section 35-5–20, is putting in a rig in Sespe canyon.

The Sespe Canyon Oil Co. will put in a standard rig.

Owing to delay in arrival of tools, etc., the Crawford wells, in Section 35–5–20. are temporarily closed down.

COLORADO.

BOULDER COUNTY.

A mill may be erected on the Superior mines, near Wark: Manager Olympius.

Crosscutting is progressing on the Ward-Rose.

On the Golden Eagle two tunnels are in 800 feet. Ore from a recent shipment ran 1.64 ounces per ton.

Conger, Wannamaker & Co., Nederland, recently shipped sixteen tons high-grade tungsten concentrates.

Supt. W. J. Barrett reports a strike of mineral resembling tellurium associated with gray copper in the Grass Mountain tunnel.

C. W. Caryl of Wall Street recently had an assay made of ore from the Gladys which returned 1.37 ounces gold to the ton.

Two samples taken from the 14-foot level on the Tornado yielded respectively $14 and $25 per ton in gold.

A strike of free-gold tellurium is reported made on the 300-foot level of the Lucky Star, at Wall Street.

A 100-foot shaft will be sunk on the John Jay, Ward.

Sinking is in progress at the Superior.

A shaft house is going up at the Milwaukee Extension, or Emma Daniels.

On the B. & M. 300-foot tunnels are run on the 700 and 800-foot levels.

The Big Five has resumed, after a temporary shut down for repairs and machinery. Supt. J. J. Willis has two nine-hour shifts working.

CLEAR CREEK COUNTY.

(Special Correspondence). — The Gold Fissure G. M. Co. have just completed a shaft house 28x60 feet in size and installed a 60 H. P. boiler and steam hoist capable of operating to 1000 feet depth. The shaft has reached 140 feet depth and sinking will continue to perhaps 200 feet, when a crosscut will be run to the vein, which has been opened on adjoining properties. Drifts will also be run from the shaft to parallel veins. The shaft is well timbered and is planked up.

The Empress Co., owners of the Gold Dirt, have this property opened by a 500-foot shaft, with drifts on the vein at various levels. Besides, they are driving a tunnel to cut the ore body at greater depth.

Misses Dillingham & Stewart are making a success of their Silver Mountain mine and now contemplate erecting a tram line to transport ore from the mine to their mill at the railroad, and they will increase their mill capacity.

Empire, Nov. 20.

E. Bondy has bought the Mayflower, on Democrat mountain, and the Empress Augusta, in Argentine district, near Georgetown.

DOLORES COUNTY.

H. L. Jones has leased several dumps at Leadville and he has put the old Rico mill in shape for zinc-lead concentration. Operations will soon begin.

Work on the Robinson group, in Floral gulch, is suspended for the winter.

Air connections in the Wellington tunnel, Rico, are made.

The Colorado M. & C. Co.'s plant at the mouth of the Group tunnel is running.

FREMONT COUNTY.

The Rocky Mountain smelter, Florence, will start up this month.

The Dorcas cyanide plant, Florence, 120x200 feet, with an elevation of 80 feet, is expected to be in full operation next month.

GILPIN COUNTY.

H. C. Eastman, manager Ontario, Central City, reports the shaft down 500 feet, and 1400 feet of drifting. A double-geared 1000-foot lift hoist, air compressor and Sullivan drills are in. Work is being pushed.

Four cars of ore from the Outonagon, on German mountain, were recently shipped to the Randolph mill, Black Hawk.

The Concrete G. M. Co. is putting in Leyner drills.

Owing to the scarcity of water, the Daisy 15-stamp slow-drop mill, Perigo, is closed down.

The shaft on the Scandia is down 550 feet. Sinking will be continued to the 800-foot level.

The Cashier G. M. & R. Co. has ceased sinking until it can establish stations at 500 feet in the Brooklyn, Lake district. The company is extending the 400-foot west level and is driving a crosscut south from this level.

Returns from twelve and one-half cords of ore treated at the 50-stamp mill of the Gilpin Mill Co., Black Hawk, from the East Boston gave thirty-two ounces gold per ton, besides twenty-five tons concentrates worth $30 per ton. The 300-foot level workings east of the main shaft are improving with development.

M. Stedman has a body of ore on the Sweet Home, Apex.

The West Notaway, Black Hawk, is shipping three cars concentrating ore weekly to Idaho Springs.

Hall & Trennery are down 50 feet on the I X L. The ore carries considerable iron.

Sinking on the National is in progress.

GUNNISON COUNTY.

(Special Correspondence).—The 48-inch round copper matte furnace of the Hoffman S. & R. Co. will soon be set up at Marble. It is designed to operate on the Carbonate and other groups of mines which are well opened in this district. On the Carbonate group about 10,000 tons of copper carbonate ores are exposed, which it is estimated will yield about 10% copper, with some silver.

Scott & Ogden of Aspen have a 2½-year lease on the Black Queen group, in the same locality, which is expected to produce a considerable tonnage of silver-gold-bearing ore for the Hoffman smelter.

Marble, Nov. 21.

The tunnel on the Gold Link group, in Gold Brick district, near Pitkin, is in 50 feet. A new track and a car are in, and buildings are going up.

On the Walter Wilson, in Italian basin, the shaft is down 150 feet.

R. McNeil is shipping lead ore from the Undine, near Marble.

HINSDALE COUNTY.

Smith & Gaines will push work on the Ajax and Moro claims, on Henson creek, near Capitol City, during the winter. Twelve men will be put on, and next spring they expect to put in a tramway and mill.

LAKE COUNTY.

(Special Correspondence).—J. S. Loder reports that the two additional Loder hot-blast furnaces being installed at pyritic smelter of the Boston Gold & Copper Reduction Co. will be in operation by Dec. 15th. There has been one furnace in operation for some time. The new ones are 36x140 inches on the interior. Four high-pressure boilers, 150 H. P. each, and a 500 H. P. Corliss engine are being put in, to bring the power up to the requirements.

Leadville, Nov. 24.

Operations are resumed at the No. 2 shaft of the Weldon, Leadville, recently burned.

Sinking is resumed at the A. V. shaft of the A. V. Co., near Harrison avenue, Leadville. A 10x10x16 water tank will go in.

Drifting is in progress on 500-foot level at the Valentine.

The Capitol hill shaft is down 200 feet.

Improvements to the Gold–Copper smelter are under way.

Ore from 700-foot level of the Sedalia, Leadville, recently gave forty ounces gold, fifteen ounces silver and 20% lead—about $32 per ton. A new electric lighting plant is going in; O. C. Bartholomew, manager.

Manager Guth is pushing work on the Banker, Leadville. Ore from the 800 level recently assayed eighty-two ounces gold, six ounces silver and 3% copper to the ton.

The Belle of Granite is producing from forty to fifty tons ore per day.

Manager Mamlock of the Doris expects to open up good ore bodies this winter.

The Resurrection shaft No. 2, now down 300 feet, will be sunk to the 1000-foot level. Drifting will begin at the 800-foot level. Ore bins with double tracks underneath have been put in.

Several projects are on foot at Leadville to inaugurate electric power at the mines near there.

LAS ANIMAS COUNTY.

The La Belle Coal Co., operating the La Belle, at La Belle, 6 miles from Trinidad, is shipping coal to Denver. The company is advertising for fifty coal miners.

The Prospect Coal Co., operating one-half mile from Trinidad, has 100 men working.

The mines of the Colorado Fuel & Iron Co., at Sapris, Starkville and Engleville are running full time; 4000 men are employed.

The Victor Fuel Co., at Hastings, Downing, Gray Creek, Chandler and Maitland has 3600 men employed.

The Colorado & Southern, it is said, will soon begin shipping coal to Galveston and New Orleans, and eventually to South America. The company will increase number of employes at Trinidad to 100.

OURAY COUNTY.

It is estimated that ores running from $12 to $15 per ton, after a reasonable wagon haul, can be treated at a profit by the new Home pyritic smelter at Ouray, which is expected to be blown in in latter part of December; W. West, manager.

The Silver Link (copper), near mouth of Poughkeepsie gulch, will put in a gasoline hoist. Shaft, now down 85 feet below tunnel level, will be sunk an additional 15 feet, at which level drifting will begin.

The new Loder matte smelter at Ouray is nearing completion.

PITKIN COUNTY.

The Bushwhacker M. Co., Aspen, has reduced royalties to leasers in the Bushwhacker as follows. Old royalties above tunnel level on net value: Up to 25 ounces 25%, 25 to 35 ounces 30%, 35 to 50 ounces 35%, 60 to 70 ounces 40%, 70 to 100 ounces 45%, over 100 ounces 50%. Old royalties below tunnel level: Up to 20 ounces 15%, 20 to 30 ounces 25%, 30 to 40 ounces 35%, 40 to 50 ounces 45%, 50 to 50 ounces 50%, 60 to 70 ounces 55%, 70 to 80 ounces 57½%, 80 to 90 ounces 60%, 90 to 100 ounces 62½%, 100 to 120 ounces 65%, over 120 ounces 70%. New royalties above and below tunnel level: Up to 20 ounces 15%, 20 to 25 ounces 20%, 25 to 30 ounces 25%, 30 to 40 ounces 30%, 40 to 50 ounces 35%, 50 to 70 ounces 40%, 70 to 100 ounces 45%, 100 ounces and over 50%.

SAGUACHE COUNTY.

The San Luis Valley Land & M. Co. has put in a 100-stamp mill, capacity 200 tons per day, on the Independent, on Cottonwood creek, near Crestone. The mill also has forty Frue vanners. The company has also put in a sawmill, with capacity of from 10,000 to 20,000 feet per day, on Spanish creek.

SAN JUAN COUNTY.

The 40-stamp addition to the Gold King mill, Silverton, is about completed. Mill will have a daily capacity of 200 tons. Big bodies of ore have been opened up recently, and it is thought that capacity of mill will have to be doubled within a year.

The two mills on the Sunnyside are running steadily.

The new Kendrick & Gelder smelter is running. The furnace has a daily capacity of 200 tons.

SAN MIGUEL COUNTY.

F. Smith of Ouray has an option on the Parnell and Emmet mines of Telluride. Ore from the Parnell has assayed .08 ounce gold, 12 ounces silver and 46% lead per ton, while that from the Emmet has run 252 ounces silver and 37% lead per ton.

At the Gold King, Telluride, twenty stamps are dropping on that property, now being worked by leasers. Ore returns $20 per ton. Ten stamps are dropping on ore from the Alta, connected with the plant by a bucket tramway 1400 feet long. Work will be continued through the winter.

J. B. Bailey, general Supt. San Miguel Con. G. M. Co., has men driving a tunnel from the Hamburg workings, 250 feet above main level, to cut vein of the Elizabeth, adjoining.

Another tunnel is being run from the Golden Chief to cut vein of the Savage. It is in 700 feet and will be driven to 1450 or 1500-foot mark.

On the Little Eva, from a point 1100 feet in tunnel, a 300-foot upraise is being driven.

Dutton & Moorehead are pushing work on the Overlook, near Telluride.

The Hamburg and Champion mines, on Bear creek, are equipped with a 120-stamp mill and are connected by a tramway ¾-mile long.

The 60-ton concentrating plant of the San Bernardo M. & M. Co., near San Bernardo, is treating an average of fifty tons ore per day; fifteen cars of concentrates are shipped monthly.

The additions to the mill of the Liberty Bell are completed and plant now has eighty stamps, with capacity of handling 300 tons ore per day.

SUMMIT COUNTY.

(Special Correspondence).—R. S. Jones, owner of the Wintergreen mine, at this place, is preparing to start operations on that property again, after a close-down of two years. Mr. Jones has a contract to supply the Rocky Mountain smelter at Florence with fifty tons per day of Wintergreen ore, which carries about 45% excess of iron, 23% sulphur, 5% to6 % silica, a small per cent of copper, and gold and silver to the amount of $5 to $7 per ton of ore. He is putting in a compressor so that air drills may be used.

Kokomo, Nov. 21.

The Ten Mile Leasing Co. is incorporated to work the New York and Surplus properties, at Robinson, containing 108 acres; H. M. Shepherd, manager.

TELLER COUNTY.

(Special Correspondence).—The building over the Gold Coin shaft is constructed of brick, with roof supported by a steel structure; is of such design and finish as to make an attractive appearance. The interior is well arranged and includes shaft house, compressor and engine room, boiler room and blacksmith shop. The gallows-frame, constructed of heavy Oregon pine timbers, rises about 60 feet above the collar of the shaft, the roof over the sheaves forming a cupola to the main building; hoist cylinder 24i nches diameter, 48-inch stroke, 12-foot reels for 3000 feet of steel cable. It is operated from a platform, on which are hand and foot levers. The disc strap and post brakes are operated by compressed air, as is also the reversing gear of the engine. The shaft is three-compartment — two for double-deck cages and one for pipe space and ladderway. The depth of the shaft is over 1000 feet

The air compressor is a cross-compound; high pressure steam cylinders 20 inches diameter, low pressures 34 inches. The same figures apply to the dimensions of the air cylinders. Both high and low pressure cylinders have 36-inch stroke. The steam cylinders have a position behind the air cylinders. The flywheel is grooved for rope transmission from an electric motor in case the latter should become the motive power, in which case the steam cylinders could be disconnected.

This compressor is rated 400 H. P., with capacity to operate twenty-four drills, and it is calculated that a duplicate of it will soon be put in to be operated by electricity, hence the air cylinders to be left out of the construction.

The Denver Leasing Co. is sinking and developing on the Victor Con. claim, which belongs to the Calhoun M. Co. The shaft is 150 feet deep, over which is an electric hoist. The property is on Battle, near the Ajax.

The Ajax is preparing to put in a 25-drill air compressor. The shaft is still sinking. Its depth is now 700 feet and it will be sunk to 1000 feet. At present about ninety tons per day are being hoisted.

The Coriolanus group of several shipping properties on Battle mountain is being equipped with a complete plant of machinery, consisting of two Fairbanks, Morse & Co. boilers, a Leyner air compressor, a Mine & Smelter Supply Co. hoist, a heavy wood gallows-frame and a shaft house to enclose all, including blacksmith shop. The equipment is being put in under the directions of C. L. Cleaver. The main shaft, over which this equipment is being placed, is 500 feet deep, double compartment and well timbered up.

The Whisper shaft, on the Gold Sovereign group, has worked under lease for three or four years to Allison, Myers & Stumpf, who now ship 125 tons per month of ore running one and one-half to two ounces gold to the ton, from their 400-foot shaft. Some of the shipments have been high grade. The Gold Sovereign ground has been under lease since it was opened up. There are nine to ten acres in the group on the west slope of Bull hill.

The John A. Logan is now equipped with a new plant of machinery, which consists of three Heine safety boilers, aggregating 900 H. P., a Norwalk 35-drill air compressor, having compound air cylinders, a 38x36-inch steam cylinder, with intercooler between the high and low pressure air cylinders, a first-motion, duplex hoist, having a capacity for 2000 feet depth, with a speed of 3000 feet per minute. Over the 1030-foot shaft is a heavily timbered gallows-frame, which reaches 60 feet above the collar of the shaft. Electric motors will be put in to supply power in the machine shop and to operate a blower in the blacksmith shop.

At a point 1100 feet east of the Logan, but 300 feet higher, is the American Eagle shaft, which is equipped with a roomy shaft house and a hoisting engine with 24x48-inch cylinders. This shaft is 1200 feet deep. Air drills will be operated here by air from the Logan compressor, which will also supply similar power for the Orpha May. In a short time the underground workings of the Eagle, Logan and Orpha May will be connected, the entire group being now the property of W. S. Stratton. John Stark is superintendent and F. E. Ramsay master mechanic.

The old Wild Horse shaft is now known as the Bull Hill shaft, the new Wild Horse shaft, adjoining it, having been equipped with machinery for hoisting. The entire group belongs to the Consolidated Gold Mines Co., controlled by the Woods Investment Co. WASCOTT.

Victor, Nov. 24.

(Special Correspondence).—Recent improvements and developments at the Granite mine, on Battle mountain, put that property in first-class condition. A new steam hoist of slide valve type, with cylinders 18x36 inches and conical reel for round cable, good for 1500 feet depth, will be ready for operating by Dec. 1st. Its power will be furnished by two boilers of 225 H. P. The shaft is now 1000 feet deep, having recently been sunk from the 800 to the 1000 level. Crosscuts have been run from the shaft to the vein on the ninth and tenth levels and upraises are being made to connect the two lower levels with the upper workings at the eighth. During the progress of this development ore shipments have been merely incidental; but, after Dec. 1st, a large tonnage will be shipped regularly. The new shaft house is ample and the shaft itself is well timbered, and the character of the underground timbering is the pride of those in charge. Compressed air for drill power is conveyed from the La Bella power plant at Goldfield, a distance of 2500 feet, through a 4-inch pipe line. This is one of the Smith–Moffat groups. C. H. Cannam is Supt. WASCOTT.

Victor, Nov. 24.

On the Uncle Sam, Cripple Creek, the shaft is down 350 feet.

Drifting is in progress on the 140-foot level of the Gold Bond.

T. J. Moynahan is hoisting ore from the 150-foot level of the Mariposa.

F. O. Wood has opened up ore on the 200-foot level of the Last Claim, on Mineral hill.

Two shifts are working on the Moose. The shaft is down 1000 feet and drifts are being run both ways at this point.

The Anchor G. M. Co. will work the Black Jack, on Beacon hill, Cripple Creek. A 150-foot shaft is on the property, but it is probable a new one will be sunk.

A duplex sinker will be put in on the Acacia and water drawn from the 500-foot level.

Crosscutting is in progress on the 100-foot level of the Anaconda of the Arno Co.

The Mattie Williams, on Galena hill, is shipping ore.

The main workings of the Bonanza King above the 300-foot level are reported about played out.

Work is started on the Ida May and Silver Lake.

A 100-foot shaft will be sunk on the property of the Olympian G. M. Co., on Bull hill.

Supt. Camp of the Elkton, Victor, thinks the new plant will start in a week or so.

The initial shipment of ore from the 178-foot level of the Deadwood was recently made.

Ore from the 260-foot level of the Bonnie Nell, on Raven hill, Victor, assays $12 gold to the ton.

Lessee Burris of the Australia and Little May claims is shipping smelting ore.

Lessee Kellum, operating the Sunshine and Anna Bell claims, is pushing work with good results.

Drifting is in progress on the 78-foot level of the Gold Sovereign.

Timbering is being done in the levels of the Joe Dandy.

The tunnel on the Ben Harrison, on Bull hill, is in 140 feet.

Snyder, Holbrook & Co., leasing the first block of the Trail, on Bull hill, are crosscutting on the 175-foot level. Work is slow, owing to hardness of rock.

On the second block of the Trail, Williams, Holbrook & Co. are drifting north on the 51-foot level. Ore from this level recently ran $12 to the ton.

The El Paso M. Co. will take over the management of the Kimberley M. Co. on Dec. 6th, it having secured control of 600,000 shares of stock in the latter company. During October the Last Dollar shaft was sunk from the 800 to the 900 foot level.

During the week ending Nov. 17th the Independence produced 960 tons ore that averaged $55 per ton, making a total value of $52,800.

The Nabob G. M. Co. has put in a four-drill compressor on the Nabob. The shaft is down 400 feet. At 500 feet drifting will begin.

F. Murray, leasing the Gold Coin dump, is saving about two tons ore per day, half being screenings and balance coarse rock. The former average about $30 to the ton, the latter about $50 per ton. On the Triangle, of the Jack Rabbit, a basalt dyke is struck at 125 feet.

Two ten-day runs at the Butterfly-Terrible, Cripple Creek, recently returned two gold bricks—216¾ ounces and 298 ounces, respectively—valued at $8000. The mill is running steadily.

On the Providence, Victor, crosscutting is in progress on the 300-foot level.

Keller, Jack & Co. are sinking a 500-foot shaft on the Jolly Jane.

Morrell, Smith & Co. are sinking on the Maggie, and are putting in a hoist and house.

S. Stafford is shipping ore from the 60-foot level on block 20 of the Anaconda.

The Pointer shaft cut the vein at 525 feet.

Whipp & Glenn have opened up a body of ore on the Uncle Sam, Cripple Creek.

A shipment of twenty-five tons of ore of the new strike on the Colorado King is made.

The Woods Investment Co. will sink a new shaft on the Maybelle block, Lawrence townsite. The old shaft will be retimbered and sunk to the 500-foot level.

IDAHO.

BOISE COUNTY.

Twenty-two tons of ore from the Mattie, on Willow creek, near Idaho City, owned by Charles Small, recently yielded $50 a ton.

IDAHO COUNTY.

(Special Correspondence).—The Imogene, carrying high-grade ore, has been bonded by W. Houston and associates to Spokane, Wash., men. The property is located on Meadow creek, in Newsome district, and shows from 5 to 10 feet of ore.

The Alamance (a California corporation) Co.'s mill at Elk City, installed this season on the old Blue Dragon, has started up.

Butters Bros.' dredger, on lower Red River meadows, is reported to have made a successful season of eight months.

Moose Creek placers are opening up a continuation of their old channel for next year's operations. Two short flumes 30 inches wide and 7½ inches to 12 feet grade, with undercurrent and tables, have been set. Tailings from upper flume run through bedrock race and through lower flume. The channel will be tapped by an open cut through the rim. Gravel to the depth of 140 feet has been shown at the present stage of work in place of 100 feet anticipated. The deposit is proving larger in every way than was expected, what was supposed to be the limit of the channel proving to be a slide of country rock, cutting out a portion of the channel, but showing old wash intact thereunder.

The Iron Crown mine and mill at Newsome have shut down.

The Montana placers, R. G. Huston manager, are to resume work in the spring.

Newsome, Nov. 25.

D. Reber of the Crown Point, Dixie, says that machinery will be put in, and that competent miners are needed.

LEMHI COUNTY.

The Idaho Exploration & Copper Co., which recently bought the Queen of the Hills, Salmon City, will add five stamps to their 5-stamp mill; M. Rosenkrands, manager.

SHOSHONE COUNTY.

The Montana & Idaho M. & D. Co., capital $1,000,000, is incorporated at Wallace.

Near Wallace, there are ten concentrators in operation, having a combined capacity of 4850 tons per day.

MICHIGAN.

HOUGHTON COUNTY.

Fifty tons Mohawkite copper ore, shipped last June by the Mohawk mine to New Jersey smelters, was taken to Swansea, Wales, no American smelters being prepared to treat arsenical ores. Returns received show $143 per ton; smelters want all of this ore that can be given them.

The Calumet & Hecla Copper M. Co., Houghton, has filed articles of association in renewal; corporate existence of the old company will expire April 21, 1901. In less than thirty years the company has paid dividends of $70,000,000.

MONTANA.

BEAVERHEAD COUNTY.

Men are employed on Stone Creek copper claims, operated by Chicago companies. Tunnels are being driven and a shaft sunk below water level.

FLATHEAD COUNTY.

J. O. D. Ross will work his copper properties on Bull river, near Troy, during the winter.

GRANITE COUNTY.

The Albion C. Co. of Butte will operate the Albion, Revenge and Teutonic claims, near Flint, next year.

LEWIS AND CLARKE COUNTY.

A Sadtler process smelter is projected for Helena, to have a capacity at first of 300 tons ore per day.

MADISON COUNTY.

Brakey & Miller are down 50 feet on the Hobson, near Sheridan.

Timbers are going in on the Centennial-Toledo, Brandon.

A strike is reported on the Madison.

H. Dillabaugh is pushing work on the Lulu, in Georgia gulch, Sheridan, and last week shipped ten tons ore to Pueblo, Colo.

Machinery is going in at the Lake Shore.

E. L. Shafner of Cleveland, Ohio, operating the Lake Shore, near Sheridan, expects to have the 20-stamp mill running by Jan. 15th.

E. H. Trerise, general manager Madisonian, near Meadow creek, has fifty men working. New machinery is going in and more men will be put on.

MEAGHER COUNTY.

The Sparta, Banner, Anna Paul and Frances claims, on Willow creek, 4 miles east of White Sulphur Springs, are leased to G. Hailey and others of White Sulphur Springs and G. W. Towers of Butte. Men will be put on and work pushed.

The Silver Belt, Neihart, has twenty men working. The drift is in 125 feet.

Machinery weighing 39,000 pounds for the Porcupine M. Co., Dorsey, is on the ground and construction is under way. The mill will be enclosed and worked during the winter.

SILVER BOW COUNTY.

The Butte & Boston, Butte, has 600 men employed.

The Silver Bow shaft No. 3 is down 575 feet; 200 feet were sunk during the past year.

A depth of 1075 feet is reached on the Blue Jay.

Work is progressing at the East Gray Rock, 175 men being employed.

NEVADA.

ESMERALDA COUNTY.

Supt. McCormick of the Vulcan, Hawthorne, says that the Parrot will resume shortly, and that thirty men will be employed.

LINCOLN COUNTY.

A mill is going in at Quartette for the Searchlight mines. The latter employ sixty men.

A 20-stamp mill is going in at El Dorado canyon.

The Highland mill, Pioche, recently made a run on twenty tons of ore from the Bristol mines, near there. E. F. Freudenthal manager.

STOREY COUNTY.

The recorded output to the end of 1899 of the principal mlnes on the Comstock lode is approximately as follows:

Con. Cal. & Va.	$131,759,340
Belcher	36,810,500
Crown Point	34,000,000
Yellow Jacket	19,000,000
Savage	17,242,100
Gould & Curry	15,707,707
Chollar-Potosi	15,354,800
Ophir	11,090,000
Hale & Norcross	9,951,600
Kentuck	6,550,000
Imperial	5,733,500
Justice	3,270,000
Sierra Nevada	3,000,000
Union Con	2,500,000
Confidence	2,000,000
Overman	2,000,000
Empire	1,966,199
Occidental	1,000,000
All others recorded	3,857,600
Total	$322,793,346

There was a considerable production before the records were kept, probably $20,000,000 to $30,000,000. Recorded dividends to date amount to a total of $119,240,780. Total assessments levied up to the present time do not foot up $100,000,000.

The tunnel in the Burning Moscow, Virginia, is in 140 feet.

A raise is started 140 feet in on the 1750-foot level of the Con. California & Virginia.

Crosscutting on the Central tunnel level is in progress at the Mexican.

On the 1600-foot level of the Sierra Nevada 350 feet of the west drift are cleaned out and timbered.

The Holman tunnel on the Silver Hill is in 682 feet.

At the Chollar work in the main north drift is resumed. Wires for electric lighting purposes are going in throughout the mine. The south drift from the main tunnel, 40 feet east from the end of the drift and 972 feet in from the mouth, is in 169 feet.

During the week ending Nov. 24th 344 tons of ore were taken from the stopes on the 325-foot level of the Gould & Curry.

The Utah surface tunnel No. 2 is in 752 feet.

The Hale & Norcross tunnel is in 1884 feet, 10 feet having been driven during the week ending Nov. 24th.

The air compressor and electric motors at the Yellow Jacket are in.

WASHOE COUNTY.

The following officers of the Reno Smelting & Reduction Co., Reno, were elected on the 22nd inst.: O. J. Smith, president; H. Martin, vice-president; A. D. Ayers, secretary; Washoe County Bank, treasurer. Operations will soon resume.

The Reno Star, Reno, is shipping two carloads of ore weekly. Returns run from $752 to $1640 per carload.

WHITE PINE COUNTY.

The pumps at the Chainman, Ely, are undergoing repairs preparatory to clearing the shaft of water.

NEW MEXICO.

COLFAX COUNTY.

The new 3000-foot tunnel which will run under Baldy mountain, near Elizabethtown, is under way. Hand drilling will be done during the winter, and next spring machine drills will be put in.

RIO ARRIBA COUNTY.

The Standard M. Co., Petaca, is pushing work on its mica mines near there.

SANTA FE COUNTY.

The smelter at Cerrillos is reported sold to the Con. M. & S. Co. of West Virginia for $125,000.

TAOS COUNTY.

The Black Copper M. Co., now putting in a 10-stamp mill on the Black Copper, Red River, will also put in Bartlett concentrating tables.

The Red River Copper Co., C. S. Bristow Supt., will sink to 300-foot level.

T. Smith has men working in Cunningham gulch, near Tres Piedras.

The vein opened upon 100-foot level of the Strawberry is increasing in size as development progresses.

Work on the Freeport and Cinnabar claims, near Good Hope, will be pushed. Ore recently taken out ran $2000 to the ton.

OREGON.

BAKER COUNTY.

D. H. Stearns plans to work property near Huntington, dredger to be operated by electricity.

The Sumpter Miner states that there have been shipped into the Sumpter mining district within the last twelve months an aggregate of 5,000,000 pounds of mining and milling machinery.

The tunnel on the Tammany, in Cracker Creek district, near Baker City, now in 100 feet, will be driven an additional 500 feet.

The new mill for the Mammoth, Baker City, will be started up on the 5th.

A new 10-stamp mill will go in on the Bald Mountain.

At the Cornucopia the new electrical machinery is going in and will, it is stated, be ready by Jan. 1.

At the Concord, Sumpter, recently bought by the Concord G. M. Co. for $35,000, 1000 feet of tunneling has been done since last January. Work will be pushed during the winter.

JACKSON COUNTY.

Kubli Bros., operating on Gall's creek, near Ashland, have seven men working. A 60-foot shaft is sunk from 425-foot level, and east and west drifts are run, showing up good ore. Work will continue through the winter.

W. Bleckart, who has been operating on Gall's creek with ground sluices for thirty-four years, will probably put in a giant.

JOSEPHINE COUNTY.

W. G. Wright has started his mill near Grant's Pass.

A. E. Meredith has completed his bridge and pipe line across the Illinois, and will soon start piping.

Operations will begin on the Fay, Taylor and Ryel placers, on Powell's creek.

The 6x7-foot main tunnel at the Waldo (copper), Waldo, T. W. M. Draper general manager, is in 225 feet. An upraise is made from this level. The new smelter is working satisfactorily. D. H. Lawrence is Supt. of latter.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The cyanide plant on Yellow creek, near Deadwood, is treating fifty tons ore per day.

Work is being pushed on the Uncle Sam.

Good ore is coming from the Harrison at Lead.

UTAH.

BEAVER COUNTY.

The Royal Copper M. Co. of Chicago, capital $6,000,000, is incorporated to work property in San Francisco district; R. J. Coleman, general manager.

A 6x14-foot-10-inch triple-compartment, 20-foot shaft has been sunk on the Cactus (copper) of the Royal Copper M. Co., near Frisco. Ore carries gold and silver values.

JUAB COUNTY.

During week ending Nov. 24, the following shipments were made from mines at Tintic:

	Cars.
Centennial Eureka	20
Bullion-Beck	2
Gemini	5
Godiva	4
May Day	1
Grand Central	1
Carissa	3
Mammoth	1
Ajax	4
Swansea	3
Star Consolidated	4
Tesora	12
Showers Consolidated	1
Total	61

The Humbug, Tintic, is shipping ore to Salt Lake smelters.

LINCOLN COUNTY.

Manager Lathrop reports a strike on 100-foot level of the Ophir at Stateline. Work will be pushed.

SALT LAKE COUNTY.

An assessment of 2 cents per share is levied by the Northern Light M. & M. Co., Salt Lake, to continue work through the winter.

A 300-foot flume is going in at the Castro placer, Bingham; the dam is being repaired and things put in shape for work next spring and summer.

The mill at the Butterfield (Queen tunnel) is going in.

At the Red Wing Extension the upper tunnel is in 75 feet; lower tunnel is in 150 feet.

The Nast will soon make a 100-ton shipment.

The Homestake and Eldora groups in Little Cottonwood canyon, near Union, are reported sold to W. F. Snyder for $36,000. Ore assays 40% lead and 9 ounces silver per ton. Work will be pushed during the winter.

SUMMIT COUNTY.

Following are shipments of ore from the Mackintosh sampler for week ending Nov. 24:

	Pounds.
Daly-West	822,000
Silver King	769,000
Anchor Con	166,000
Ontario	95,000
California Con	48,000
Total	1,900,000

Manager J. E. Bamberger of the Daly-West, Park City, is pushing work on the 1400-foot level. One hundred and thirty-five tons ore daily are handled at the mills and over sixty tons ore per day are marketed.

During the year the properties of the Anchor M. Co. at Park City have produced 5,200,000 pounds lead, 155,501 ounces silver and 330 ounces gold, with 3800 pounds copper.

TOOELE COUNTY.

The Con. Mercur G. M. Co.'s transactions for October show a net profit of $47,167.81. During the month 30,243 tons of ore yielded bullion valued at $133,280.27; cost of mining, $1.40 per ton; cost of milling, $1.44; total expense of production, $2.84 per ton; total expenses of operation aggregated $86,112.46.

The new concentrator of the West Argent M. Co., at Stockton, is running; cost, $12,500; capacity, 100 tons per day; manager, F. R. Ball.

The Bingham West Dip Tunnel Co., owning 520 acres land on west slope of the Oquirrh mountains, will drive a tunnel through these mountains to strike the Bingham district 2000 feet below the lowest workings of that camp. They also expect to use the water opened up for power and irrigation purposes.

The Cygnet of Stockton is shipping ore running high in lead, with several ounces silver per ton. Work will continue through the winter.

Manager F. R. Ball of the West Argent, Stockton, will run mill to its full capacity.

The shaft at the Honerine, Stockton, is unwatered and crosscutting is in progress on lower level; Manager Scheu.

UTAH COUNTY.

J. Knight will close down the Black Jack, near Provo, for the winter, and maybe indefinitely, as outlook at present time does not justify further outlay for development.

A recent shipment of four cars ore from the Star Con., Springville, Manager Packard, returned $2328.87. Assay yielded 1.56 ounces gold and 7 ounces silver per ton, giving a net value of $21.84 per ton.

WASHINGTON.

FERRY COUNTY.

The Republic Con. G. M. Co., Republic, will enlarge its plant.

The California M. Co., operating the California group, near Republic, are down 300 feet.

The Republic mill will begin treating about twenty tons ore from the Black Tail, Republic, by Jan. 1, when more men will be put on at that mine, Supt. W. M. Crummer.

The Bodie, on Toroda creek, near Bodie, will be worked during the winter. A new 100-foot shaft is being sunk. One hundred tons ore will be shipped to Midway, B. C., for test. If results are satisfactory, ore will be shipped to that point during the winter. Main tunnel is in 325 feet.

The crosscut tunnel at the Maud West is in over 250 feet.

On the Oxford the crosscut tunnel is in over 125 feet.

The Ruby Fraction, on west bank of Eureka gulch, near North Republic, is reported sold to D. A. Mills, who owns the Oversight adjoining. The two will be consolidated. A steam plant may be put in early next spring.

Two 10-hour shifts are working in the Wauconda tunnel, now in 190 feet. Driving averages 3 feet per day.

The Oronga, Manager Manley, will resume.

General Manager M. R. Straight of the Unga group will push work on tunnel, now in 300 feet.

The south drift on No. 2 level of the San Poil, Republic, is in 720 feet.

Supt. Porter of the Golden Lion—Little Four property—has driven new tunnel in over 80 feet.

Crosscutting is in progress at the Black Tail.

The winze at the Princess Maud is down over 280 feet.

The California and Gold Ledge mines now have telephone connection with Republic.

Crosscutting is in progress on 135-foot level of the Gold Ledge, Republic.

PIERCE COUNTY.

There are twenty-five coke ovens in operation at Fairfax. More will be put in next spring.

The Northern Pacific R. R. Co. has men prospecting for coal between Carbonado and Fairfax.

SNOHOMISH COUNTY.

A 50-foot tunnel will be driven on the Bunker Hill-Sullivan group, Index.

More men will be put on at the Nonpareil, Everett.

The Copper Bell, Gray Bros., has resumed. A new settling pot for handling the matte and slag is going in.

WHITMAN COUNTY.

Kyme & Smith of Moscow will drive a 100-foot tunnel this winter on the Hoodoo Queen, Hoodoo, for the Gold Mountain M. & M. Co.

Taylor Bros. are working two shifts on the Mother Lode. They will put in a new concentrator next spring.

New machinery is going in on the Blue Bird. Work will be continued through the winter.

The Bishop, on Jerome creek, has resumed after a long idleness. Shipments of ore are expected to begin soon.

WYOMING.

ALBANY COUNTY.

A strike of good copper ore is reported made on 80-foot level of the Rambler, 45 miles west of Laramie.

CARBON COUNTY.

Copper is reported found on Green mountain near Grand Encampment. Selected samples gave returns of copper, gold and silver.

FOREIGN.

BRITISH COLUMBIA.

A mill will go in on the Rambler-Cariboo to treat low-grade ore.

Cinnabar is reported found on the west side of Lake Okanogan, opposite Miston, in Keremeos valley.

The Arlington M. Co., Ltd., has done about 5000 feet of work on the Arlington group, near Slocan.

W. H. Jackson is pushing work on the Black Bear, Wide West and Eclipse, Lardeau.

The Paradise, on Toby creek, East Kootenay, has 2000 sacks ore ready for shipment.

A diamond drill will go in on the Deane, J. H. Fink manager.

Work on the Old Abe will resume shortly.

The Kootenay Perry Creek Co. will continue operations through the winter.

The additional furnaces for the Granby

smelter, Grand Forks, will go in in January. They will have a joint capacity of 600 tons, making the total capacity of plant 1200 tons daily. A matte converter will go in at the same time.

KLONDIKE.

Vice-Consul H. T. Roller, in charge of the Dawson consulate during the absence of Consul McCook in Philadelphia for the winter, gives the following summary of gold shipments from Dawson to the outside, by months, for the season of 1900:

May	$ 561,100
June	6,797,200
July	2,459,750
August	1,954,700
September	1,259,440
October (to 17th)	1,358,400
Total	$14,390,590

LOWER CALIFORNIA.

Reports from Ensenada state that sinking for oil will be begun at Cape Colnett, 75 to 100 miles below there; M. Bernstein manager.

MEXICO.

W. C. Bogue, manager Mine & Smelter Supply Co., Salt Lake City, Utah, who has just returned from Mexico, states that near Tachaca Oaxaca, two mills, 100 and 120 stamps, respectively, are in operation.

A strike of copper ore is reported from Cananea.

The new 25-drill compound air compressor at the Grand Central, La Colorado, is running. Power is supplied by a 300 H. P. Corliss engine.

SIBERIA.

The Russian Government has decided to establish at Tomsk, Siberia, special works for the testing of gold-bearing sand and ore similar to institutions of this character in Australia.

TASMANIA.

The North Mount Lyell M. Co. will put in large reduction works.

Personal.

W. A. CLARK is at Jerome, Ariz.

D. W. BRUNTON of Denver, Colo., is in Utah.

R. L. DUNN has returned to California from Alaska.

T. F. WALSH has returned to Colorado from Europe.

R. J. DAYS of Los Angeles, Cal., is in St. Louis, Mo.

S. B. MILNER of Salt Lake, Utah, is in Twin Falls, Idaho.

J. J. WILLIS is appointed Supt. Big Five, Ward, Colo.

S. J. MILLER has returned to Tombstone, Ariz., from Europe.

B. A. JACKSON has returned from the Orient and is at Jackson, Cal.

D. W. BRUNTON has returned to Denver, Colo., from Mercur, Utah.

E. M. TAYLOR is appointed Supt. Signal M. Co., Nevada county, Cal.

M. BIERY is appointed manager Melczer M. Co., Copeta, Sonora, Mexico.

G. KISLINGBURY has returned to San Francisco from Durango, Mexico.

W. H. CUNNINGHAM of the Con. Mercur, Mercur, Utah, is in Chicago.

G. S. PEYTON of Royal Copper M. Co., Frisco, Utah, goes to Chicago, Ill.

J. DEDERICHS has returned to Salt Lake, Utah, from Spokane, Wash.

C. S. BRISTOW is now Supt. Red River Copper Co., Red River, New Mexico.

R. J. CORY, Denver, Colo., manager E. P. Allis Co., is in Salt Lake, Utah.

P. J. DONOHUE of Salt Lake, Utah, has returned there from Polaris, Mont.

G. PAXTON of Red River Copper Co.. Red River, New Mexico, is in Joplin, Mo.

W. B. PHILLIPS of Pittsburg, Pa., has been appointed State Geologist of Texas.

G. D. BLOOD, foreman Marsac mill and refinery, Park City, Utah, is in Berkeley, Cal.

J. A. FLEMING, Pres. Black Warrior Copper Co., Amalgamated, is in Globe, Ariz.

L. C. TRENT of Salt Lake, Utah, goes to Tasmania as manager Mount Lyell M. Co.

E. B. KIRBY, general manager War Eagle, Rossland, B. C., is in Toronto, Canada.

J. H. FOUNTAIN is appointed secretary Southwest Miners' Association, Los Angeles, Cal.

J. O'NEILL, Supt. Anaconda and Never Sweat mines, Butte, Mont., is in Salt Lake City, Utah.

W. H. LEFFINGWELL, M. E., recently returned from Boston, Mass., to Cripple Creek, Colo.

W. C. BOGUE, manager Mine & Smelter Supply Co., Denver, Colo., has returned from Mexico.

MESSRS. HEATHER, JR., CAMPBELL AND NEWTON of Boston, Mass., are in Jamestown, Cal.

J. H. HAMMOND is now consulting engineer Stratton's Independence mine, Cripple Creek, Colo.

F. H. PETTENGILL, vice-president and general manager Clyde M. Co., Cripple Creek, Colo., has resigned.

MESSRS. SMITH, HALL AND LEACH, of the West Argent, Salt Lake, Utah, have returned to Chillicothe, Mo.

A. EKMAN has returned to Oroville, Cal., from Paris, where he had charge of the California mining exhibit.

W. WEST, formerly of Ward pyritic smelter, is now manager of new Home pyritic smelter at Ouray, Colo., vice R. R. Bowles, resigned.

W. M. O'SHAUGHNESSY, consulting hydraulic engineer, has returned to San Francisco after a year's engagement in professional duties in the Hawaiian Islands.

Commercial Paragraphs.

THE Weigele Pipe Works, Denver, Colo., have turned out 13½ miles of pipe the present year for placer and water power work.

THE Link Belt Engineering Co. of Nicetown, Philadelphia, has an office in Pittsburg, Pa., in charge of T. Frank Webster, 1501–1502 Park building.

ON the 23rd prox. the stockholders of the Ludlow–Saylor Wire Co., Fourth and Elm streets, St. Louis, Mo., will consider and vote on the proposition to increase the capital stock of the company from $100,000 to $400,000.

THE Gardner Electric Drill & Machinery Co. will soon occupy a three-story brick building on Blake St., Denver, Colo., for factory and salesroom for the Electric rock drill, which was described and illustrated in this paper in the issue of May 26, 1900.

DAVIS & BYLER, mining engineers, Victor, Colo., have prepared a topographical, wood-carved chart of Cripple Creek district, which will be finished in colors, showing the geological formation and other features, including the railway lines, mines, mills and towns of the district.

ALVIN PHILLIPS, whose ore-testing plant at Denver, Colo., is kept constantly busy, reports that recent tests by concentration and cyanide has determined the erection of milling plants in Idaho and southern California. Mr. Phillips' tests on the Bartlett concentrating table have been specially interesting.

THE Southern Pacific announces rates of $8 and $10.50 per ton on coke from West Virginia and Tennessee to California points. The company also announces a reduction in the rate on iron pipe from Eastern shipping points to California as follows: From Tennessee and Alabama, 75 to 59½ cents per 100 pounds; from New York pier, 75 to 50 cents; from Pueblo, 50 to 37½ cents.

THE Westinghouse Electric & Manufacturing Co. of Pittsburg has the contract for the appliances used in the Missouri River Power Co.'s plant at Canyon Ferry, Montana, for the purpose of transmitting power to Butte. The contract calls for six 1000 H. P. generators, six dynamos of the same capacity, twelve 1200 H. P. transformers, twelve switchboards, and a quantity of other electrical apparatus, all of which is to be delivered within five months. The generators are to be coupled to the six water wheels on the same shaft. One transformer will be used for the step-up from the low to the high tension current, and six for the step-down at Butte. It is expected that the plant which will be installed will furnish 6000 H. P., making the total capacity of the plant 10,000. The contract for the water wheels has not been let.

Recently Declared Mining Dividends.

	Payable.
Gold Coin M. Co., Colorado, $20,000	Nov. 24
Con. M. Co., Colorado, $10,000	Nov. 24
Silver Shield M. & M. Co., Utah, ½c per share	Dec. 1
Osceola Con. M. Co., $3 per share	Dec. 1
Colorado Fuel & Iron Co., Colorado, 8% on preferred stock	Dec. 1
Butte & Boston, Montana, $5 per share	Dec. 10
Acacia G. M. Co., Colorado, 1c per share, $15,000	Dec. 15

Catalogues Received.

The American Copper Mining & Extraction Co., patentees of the Gardiner copper leaching process, have issued from their office at Denver, Colo., an illustrated pamphlet, giving information relative to this process and results of experiments therewith.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING NOV. 20, 1900.

662,163.—HOISTING APPARATUS—H. C. Behr, S. F.
662,341.—HAY PRESS—A. Bennett, Puyallup, Wash.
662,053.—SHADE ROLLER BRACKET—H. M. Benson, S. F.
661,945.—WEIGHING MACHINE — J. W. Berry, Tacoma, Wash.
662,252.—FILTER—J. O. Crosscup, S. F.
661,957.—BOX NAILER — I. E. Davis, Coralitos, Cal.
662,060.—LADDER—I. M. Dillman, Oakland, Cal.
662,262.—SHINGLE — C. A. Galvin, Modesto, Cal.
662,273.—OIL CAN—F. B. Hinkelbein, San Jose, Cal.
662,276.—GAS GENERATOR—J. P. Kistler, Tacoma, Wash.
662,004.—TURFING TOOL — H. E. Laurence, Fresno, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COMBINATION GUN CARTRIDGE.—No. 662,137. Nov. 20, 1900. H. A. Tellerson, Oakland, Cal., assignor to Winfred Castor of San Francisco. This invention relates to an improved construction for gun cartridges. It consists of a two-part base with means for removably securing the parts together. A paper or eqivalent shell has one end crimped and clamped between the two, and a pin secures the two parts of the base in the interlocked position. One of the parts of the base has a hole with an inclined wall which is engaged by said pin to allow for variations in the thickness of the shell, and to insure the alignment of the parts.

DESIGN FOR A CALENDAR.—No. 30,366. Nov. 20, 1900. M. C. Hall, Bakersfield, Cal. The leading or material feature of this design consists of the representation of a watch with a stem and ring. Arranged within the inner periphery of the watch are a series of small representations of dials having figures indicative of the hours and names of cities in different longitudes around the world, hands on the dials point to the hours, indicating the time in those cities with relation to each other. Interior to these small dials and concentric with the outer rim is a pictorial representation of a globe, showing a part of the world. The main dial is supported upon a rectangular base which is subdivided for the number of days contained in a month. The ends of this base are connected with supporting posts, one of which has upon the top the figure of Time, with scythe and hour-glass, and upon the other the figure of the Goddess of Liberty. The bases of the posts are represented as spanning the Golden Gate, and upon each side are views of the elevations of land between which the waters of the strait flow.

Latest Market Reports.

SAN FRANCISCO, Nov. 28, 1900.

SILVER—Per oz., Troy: London, 29⅝d (standard ounce, 925 fine); New York, bar silver, 64⅛c (1000 fine); San Francisco, 64⅛c; Mexican dollars, 51c.

COPPER.—New York: Lake, 1 to 3 casks, $17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.75; carload lots, 16.50; Casting, 1 to 3 casks, 16.62½; carload lots, 16.45. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.37½; Salt Lake City, $4.00; St. Louis, $4.30; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £17 5s per ton.

SPELTER. — New York, $4.35; St. Louis, $4.15; San Francisco, ton lots, 5¾c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $14.50; gray forge, $14.00; San Francisco, bar, per lb., 2½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $20.00; open hearth billets, $23.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $28.50; San Francisco, ton lots, 30c; 1000 ℔s., 30½c; 500 ℔s., 30¾c; less, 31c; bar tin, ⅌ ℔, 35c.

QUICKSILVER. — New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.00 ⅌ flask of 76½ ℔s.; Export, $45.

NICKEL.—New York, 50@60c ⅌ ℔.

MAGNESIUM.—New York, $3.00 ⅌ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¼c; slab, 5¾c; bar, 7c.

BABBITT METAL.— San Francisco, No. 1, 10c.

SOLDER. — Half-and-half, 100-℔. lots, 18.70c; San Francisco, Plumbers', 100-℔. lots, 15.85c.

ASSAY LITHARGE.—San Francisco, 10c ⅌ ℔, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

BISMUTH.—New York, ⅌ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

PHOSPHORUS. — F. o. b. New York 50@60c ⅌ ℔.

TUNGSTEN.—New York, ⅌ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.— San Francisco, crude, $17 ⅌ oz.; New York, $18.20 per Troy oz

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¼c ⅌ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32½@33½c ⅌ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ⅌ ℔.; soda ash, $1.60 ⅌ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ⅌ ℔.; blue vitriol, 5½@6c ⅌ ℔.; borax, concentrated, 7@8c ⅌ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾ @ 2c; nitric acid, in carboys, 8c ⅌ ℔.; caustic soda, in drums, 3@4c ⅌ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ⅌ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

OILS.—Linseed, pure, boiled, bbl., 86c; cs., 91c; raw, bbl., 84c; cs., 89c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 70c; cs., 75c; No. 1 bbl., 50c; cs., 55c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 65c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

AND PACIFIC ELECTRICAL REVIEW.

Whole No. 2107.—VOLUME LXXXI. Number 23. SAN FRANCISCO, SATURDAY, DECEMBER 8, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Electric Mine Locomotives.

As in other forms of electric transmission, mine haulage is progressive. The first electric mine locomotive was put in use in 1888, and in the twelve years there is a notable advance in such application. Where mine conditions are such as to admit of mechanical haulage, the electric locomotive presents many features of economical efficiency that commend it to public consideration. The first cost is necessarily high; but, figuring on the matter as an investment proposition where a degree of permanence obtains, the consequent saving in operation and maintenance brings into view its economical features. Among other claims in that regard are brought forward the statements that the use of an electric haulage plant is economical because of freedom from complicated mechanism in the locomotive; small friction loss; power consumed only when doing work, and then in proportion to the work done; absence of heat, smoke, gas and steam; inexpensive line construction; size of locomotive needing no extraordinary enlargement of vertical entry section; locomotive wheel base, admitting of operation on curves of radii as short as 15 feet; light weight of locomotive for given tractive duty and capability of operating on heavy grades; adaptability of the electric power to pumping, hoisting, lighting and other mine duties besides haulage.

On this page appear illustrations of various types of locomotives built by the General Electric Co. Fig. 1 is of their standard mine locomotive, equipped with cab and special draw-bars for surface work. This locomotive, as portrayed herewith, is used by the Minnesota Iron & Steel Co., Minneapolis, Minn.; its weight is 13 tons; draw-bar pull, 4500 pounds; speed, 8 miles per hour. Fig. 2 shows an electric locomotive used by the Bunker Hill & Sullivan M. & C. Co., Kellogg, Idaho. Supt. Barbridge says this locomotive hauled a train of twenty cars, each weighing, when loaded, about 3500 pounds. Its draw-bar pull is 1000 pounds; speed, 6 miles per hour. Fig. 3 is of an industrial locomotive for inter-factory transportation, used by Balfour & Guthrie of San Francisco. Its weight is 4000 pounds; draw-bar pull, 500 pounds; speed, 8 miles per hour.

In the issue of Nov. 25, 1899, was given a description of the electric traction at the Hidden Treasure mine, Placer Co., Cal., with illustrations specially engraved for this paper. Regarding the operation of this locomotive, Harold T. Power, president of the company, says that, when operating by animal traction, not over 180 tons of gravel could on an average be hauled in two shifts of ten hours each; with the electric locomotive an average of 350 tons of material was handled during the same period of time. With animal traction it required 30 minutes to take in the men; the electric locomotive made the trip in 8 minutes. The locomotive runs steadily 20 hours a day, 6 days in the week. The issue referred to has detailed figures comparing electric with animal traction at the last named mine, which are of value to any one interested therein.

THE latest addition to the much discussed subject of the origin of the Yosemite valley, Cal., is by H. W. Turner, a fine monograph just issued by the California Academy of Sciences. Mr. Turner's position and experience entitles his views to considerable credence, and in very extended discussion of the subject he inclines to the belief that the Yosemite valley "was formed by river erosion, facilitated by strong jointing."

◆

THE importance of Cripple Creek, Colo., as a gold-producing district is graphically illustrated by this year's gold output therefrom, which, it is now estimated, will aggregate $23,000,000. In the last nine years Cripple Creek has produced nearly $90,000,000 in gold, with a profit to the producers of about one-half that amount, and estimates for next year include a gold output for the ensuing twelve months of $30,000,000.

◆

THE hysterical headlines in the dailies concerning the alleged formation of a "great gold trust" that is going to absorb and control all the principal gold-producing properties in the world are not to be given serious attention. Such a project is impossible from the very nature of things, and none know this better than the very men named as the projectors. Even assuming that the airy scheme were an accomplished fact, it could apply only to the present. Prospectors and miners are daily developing new properties susceptible of great gold output, and the possibilities of such further development are so great as to border on the illimitable.

◆

COPPER stocks are attracting unusual attention. Last week the $75,000,000 capitalization of the Amalgamated Copper Co. was for the first time quoted on the New York Stock Exchange. The Anaconda Mining Co.'s stock was already on its list. The Amalgamated Co. gives little information to the Stock Exchange or any other public or private organization as to its affairs, and though it regularly pays 8% dividends, the general public does not encourage such secrecy by purchase. The result of the noted reticence is that while an 8% or even a 6% dividend-paying stock ordinarily now sells for considerably above par, the stock of the Amalgamated Copper Co. sold last month, after its being placed on the New York Stock Exchange, as low as 94⅝. In general, however, at the present cost of production and selling price, copper is considered in the East as "a good buy." The Old Dominion, of Arizona, is producing 10,000,000 pounds per annum at a cost of seven cents per pound, which is indicative, in a general way, of the present profits in copper mining.

Studying Mining Engineering.

There is a manifest connection between the big salaries paid a few prominent mining engineers and the enormous increase in the number of young men "taking a mining course" at so many mining schools and in so many colleges and universities. The prizes look so big that the attraction is great, and, evidently, a great majority of the young men now studying in "mining colleges" look forward to the time when they, too, will enter upon a successful career as mining engineers at a fine salary.

It is to be sincerely hoped that each deserving student will win such a prize, but there is a difference between getting one's degree in a college and getting a good paying position, or, having such a position, in successfully and satisfactorily holding it to the mutual satisfaction of all concerned. Without decrying the praiseworthy effort, the laudable ambition or the hearty endeavor that impels a bright and capable young fellow to try and fit himself for so responsible a position, it is to be borne in mind that knowledge is not judgment, that learning is distinguishable from experience, that good intent is not proved capacity, and that the graduate from a mining college is only at the threshold of his career. He finds the field fairly filled by able men of experience, and, however gifted or endowed with educated energy, he must first learn something not possible to be learned in college—how to use his head and his hands in practical work; how to get on with others; how to act therein where so much depends upon such action; and that there is considerable work of the hardest and commonest kind that can only be learned by doing it.

Thousands go out of our colleges every year with their heads full and their hands empty; crammed with knowledge, but destitute of the "know how;" the proud possessors of degrees, but without cognizance of the practical requirements of their chosen profession, and then begins the dreary process of unlearning—of unloading the useless lumber—and retaining the few clear, bright ideas that, coupled with the knowledge acquired only by experience, will win them place. Happy those who have the fortunate faculty of forgetting; for it is only in discarding considerable of what they carry out of college that they can ever hope to succeed.

This is not said to daunt the ardor nor deter the effort of any young man who is seeking, through college, to fit himself for the position of mining engineer. Under certain limitations and with certain provisos he is on the right track; but he should realize that, while the college can and will do much for him, the number of those who are likely to attain prominence or profit is necessarily circumscribed, and that once in the field he can only get what he earns, and by his work alone can he demonstrate his value amid difficulties that do not exist in less arduous professions. The field of mining engineering offers just about the same professional rewards that any other lucrative and desirable profession proffers. The young engineer can not step from the college campus to a high position; he must show what he can do, and, as in all other walks of life, the world will pay a man whatever value he sets upon himself just so soon as he demonstrates that he is worth that. He must, however, despise not the day of small things, nor expect to be immediately placed in charge of great enterprises. It is for him to win plumes and then wear them. Happy he if he can learn the truth of this without the set-backs, disappointments and heart-breaks that so often prematurely age and weaken the spirit of the young man who fails to realize that the day he leaves college he is only beginning, and that the best he may expect to carry away from his alma mater is the trained brain. In this lies the great advantage of college education, for it is a great advantage to know what to do. The equally important advantage of knowing how to do it can, however, only be learned by subsequent work.

There is good in study and in college training: it economizes time and cultivates mentality; its influence is for good and its development favors the creative powers. The study of mining engineering or any other form of mining is to be commended when under competent instructors, but the student should remember that one must learn as long as life lasts, and that when the college doors close behind him the best and most valuable part of his education lies before him.

Proposed Federal Appropriation.

Minining and scientific progress was practically considered in the first session of the present Congress by the introduction of a bill in the interests of mining and metallurgy to appropriate yearly to each State and Territory money for the maintenance of schools of mines. Notice was made of the measure at the time of its introduction. It will be remembered that it provided about as follows: That there shall be annually appropriated out of money from the sales of public lands to each State and Territory for the establishment and maintenance of schools or departments of mines and mining in connection with the colleges for the benefit of agriculture and the mechanic arts, now established or which may be hereafter established in accordance with the provisions of an Act of Congress approved July 2, 1862, the sum of $10,000 for the year ending June 30, 1901, and an annual increase of the amount of such appropriation thereafter for five years by an additional sum of $1000 over the preceding year, the annual amount to be paid thereafter to each State and Territory to be $15,000. Such appropriations are to be expended only for geological instruction, mining engineering, metallurgy, research in road-building material and its proper application, and the branches of learning pertaining thereto, including the various branches of physical, natural and economic science and the facilities for such instruction, research and experiment, the idea being "to promote a liberal and practical education and secure the most intelligent use, conservation and development of the mineral resources of the country." In any State or Territory where a school of mines has been established by the Legislature thereof, separate from the colleges or universities hereinbefore named, the appropriation is to be paid to such institution.

The bill further provides: "That a detailed report of the operations conducted by the respective schools or departments of mines, during each year ending the thirtieth day of June, shall be transmitted on or before the first day of the following November to the Governor of the State or Territory in which said college or school is established, and a printed copy of said report shall be sent to each school or department of mines herein provided for, and to the Secretary of the Interior. Said report shall contain a statement of all experiments and work of a practical and scientific nature conducted during the preceding year, which may be considered of special value to the mining and metallurgical industries, together with the condition and progress of such school or department, including general information as to the number of its professors and students, its courses and methods of instruction, its library and general equipment. Bulletins or supplementary reports shall be published by said schools or departments from time to time on subjects of importance to the mining community or to the interests of any particular branch of mining industry or mining districts."

The bill is in direct line with existing requirements; the small amount embraced in the appropriation should be regarded as an investment that would make direct return of an exceedingly profitable nature.

It will take some effort, however, to direct public opinion to the manifest value of the proposition, and from our standpoint the success of the bill does not seem of present promise. The measure will be opposed by those who see in it a menace to their individual interests, and such opposition will be more active than the sleepy indifference of the public to anything of that nature.

◆

THERE is a growing demand for mica consequent upon its use for electrical insulation, and among manufacturers of electrical machinery mica in such small sheets as were formerly unsalable now finds purchasers. Even scrap mica is now being utilized for lubricants. Last year the United States produced 108,570 pounds sheet mica, valued at $70,587, and 1505 tons scrap mica, worth $30,878. This was considerable of a decrease as compared with former years, caused by increased imports, which last year amounted to 256,228 pounds, valued at $1,616,397. During the year 1899 the total importation of mica manufactured was 1,709,839 pounds. The importation of mica is on the increase, and domestic production is on the decrease.

Concentrates.

"CONCENTRATES" knows of no place in this country where tin ore is mined or smelted.

LAST year there was a total production of zinc oxide directly from the ore in the United States of 39,663 tons.

WATER in freezing tends to purify itself, the tendency being to precipitate the solid matter as the water congeals.

A GOVERNMENT EMPLOYE is not exempt from the annual required assessment work on a mining claim that he locates.

THE fluorspar mined near Prescott, Ariz., runs about 35 cents per ton silver, but is used as a flux by the San Francisco smelting firm to which it is shipped.

AT the beginning of the Boer war there were about 13,000 white men employed in mining in the Rand, S. A., whose average salary was about $1600 per year.

UNDER certain conditions and in conformity with certain requirements, "the vein or lode can be followed beyond and beneath the side lines of the location."

"ORE IN SIGHT" is indeterminate. Where three sides of the ore body are visible, it is possible to give measurements of quantity and estimates of values.

THERE have been poets among miners. The great German poet Goethe was a miner, and for many years had charge of all the miners in the duchy of Weimar.

ONE indication of the cessation of hostilities in South Africa is the fact that cipher telegrams may again be sent, they being no longer interdicted, and a code book is once more of some value.

A GOOD anti-friction metal is made of Banca tin 89%, antimony 7.4%, Lake copper 3.6%. The Government bought 20,000 pounds of that alloy last week, delivered at Washington, D. C., at 27½ cents per pound.

FINANCIERS figure that at present there are about 12,500 tons of gold in the world, of which about 7200 tons is monetary gold stock, nearly six times as much gold being in circulation as there was 100 years ago.

THE "electric explosion" noted in the San Francisco daily papers as occurring in a building corner Sansome and California streets, was an explosion of gas. Electricity does some queer things, but never "explodes."

A MAN can not hold a quartz location "by building a reservoir and spending $100 worth of work on the reservoir, but doing no other kind of work on the quartz claim," even though the reservoir be situated on the claim.

EIGHT PERSONS can locate, jointly, 160 acres placer claim; for each twenty acres the equivalent of $500 in work or improvement must be done before the locators can secure patent. One discovery on the whole tract is sufficient.

CRYOLITE is extremely fusible, melting in a candle flame; it is used in the manufacture of aluminum and sodium. It is found in small quantities in Colorado. Its chief source of supply is from Greenland, where it is found in large deposits.

SQUARED TIMBERS 12 to 18 inches are frequently used for mine timbering, and in the Cœur d'Alenes are thoroughly coated with lime when put in, which, adding to the light of the station, aids in preserving the timber, and as a slight fire preventive.

IF an inventor forgets or abandons his invention after a reduction to practice in private, and before a public use, his competitor may claim the patent. If he forgets or abandons it after a public use, his competitor can take no patent, but the forfeiture will inure to the benefit of the public.

THE watt is the unit by which electrical energy is measured. It is calculated as being equal to the current of one ampere flowing at a pressure of one volt, i. e., a current of ten amperes with a pressure of 100 volts represents 1000 watts. A horse power is understood to be the equivalent of 746 watts.

IN figuring on electrical transmission and thus utilizing water power, where the question comes up of relative cost, it is to be remembered that in the case of building a dam and construction and maintenance of a reservoir, is involved a fixed investment, and one that is not ordinarily susceptible of being turned into money.

IT is now common in chlorination work to neutralize the free chlorine in the leach liquors by ferrous sulphate instead of by use of SO_2, about seventy-five pounds of the sulphate being added to thirty tons of the solution. The ferrous sulphate is obtained as a by-product from the generation of the hydrogen sulphide there used as a precipitant for the gold.

THERE is nothing electric about "galvanized" wire. The process of manufacture is purely mechanical throughout. The wire, after annealing, is cleaned in dilute hydrochloric acid, then run through a trough containing a slightly stronger bath of the same acid, into molten zinc, then rewound, the superfluous zinc being wiped off as the wire leaves the bath, by means of asbestos or sand.

MOLYBDENITE, concentrated, is worth about $200 per ton. Molybdenum is quoted at $1.45 per pound in New York City. It is not used on the Pacific coast. The Illinois Steel Co., Chicago, or the Bethlehem Steel Co., Bethlehem, Pa., could furnish information as to probable purchase of either the molybdenum sulphide or the metal itself. It is commercially used as a deoxidizer in steel manufacture.

FOR shingling 4-penny cut nails are considered superior to 3-penny wire nails. The latter are the same size all through, and they rust out near the head by continual exposure, while the former has twice the amount of material near the head than at the point, and will last much longer. Iron nails are considered preferable to those made of steel.

A CHANGE in the output of a mine is not unusual. In the Comstock, Nevada, the ore was almost exclusively silver bearing at first, but depth yielded bullion that was 54% silver and 46% gold; the Anaconda was originally a silver mine, but with depth changed to copper; in many cases in Colorado silver-lead ore has changed with depth in gold ore assaying in some cases twelve ounces to the ton.

IT is against the business policy of this paper to take machinery or supplies of any kind in payment for advertisements therein. It would be manifestly unfair to our advertising patrons to do so, because the only use the paper would have for such material would be to sell it, and that would immediately put the paper in the position of being a competitor of the men who advertise herein; hence such proffers are invariably declined.

ANY company can change its principal place of business by holding a special stockholders' meeting to amend its by-laws for that purpose. The principal office must be in the State in which the company is incorporated, but they can have as many other offices as the board of directors deem advisable. The company can do business in any county in this State by filing a certified copy of their articles of incorporation with the county recorder where they desire to operate.

AN assay from a specimen piece of ore, however accurate, is no index of the value of the ore body from which it came. The assayer can only give the value of the sample furnished him. To afford any fair idea of the value of the mine the sample must be of the average of the ore and not a picked specimen; and a "mill run" of ten tons can, with a little further effort, be simply an aggregate of selected ore much richer than the average ore from the mine would furnish.

WITHIN the last decade sulphuric acid has been commercially produced by passing a mixture of air and sulphur dioxide over finely divided platinum heated to 400° C. Sulphur trioxide is thus formed as a vapor, which is dissolved in water, thereby forming sulphuric acid. Special precautions are taken to keep the heat below 800° C., at which temperature the sulphur trioxide is decomposed into sulphur dioxide and oxygen. On account of its simplicity and cheapness, this method seems likely to replace the older and more cumbersome process.

READERS of this paper doubtless notice that through the years appear fine engravings of mining scenes from every part of the earth where mining is carried on. For the photographs from which these engravings are made we are largely indebted to the thoughtful kindness of so many of our friends who, traveling about, send pictures of note from where they are sojourning for a season. We would be pleased to receive photographs of mining scenes for such reproduction from our readers everywhere, and would gladly give due credit for such graphic remembrance.

WORK on the Sutro, Nevada, tunnel began October 19, 1869. Connection was made with the Savage shaft July 8, 1878. The distance from the mouth of the tunnel to the Comstock vein is 20,016 feet. The tunnel was bored by "day's work," $5 per day being the lowest wages paid workmen. The "system or plan by which the owners were remunerated for the expense" never fully materialized. The plan was to secure sufficient in royalty for the use of the tunnel by Comstock mine owners to produce profit. But by the time the tunnel reached the Comstock the bonanza days were about over.

THE two names muscovite and sericite practically signify the same mineral, though sericite is employed for the fine-grained or fibrous and tufted modifications resulting from the replacement of other minerals. Sericite is probably the most universal and abundant of all minerals forming in altered rocks near fissures. Only a few classes of ore deposits—namely, those in limestone and those in recent volcanic rocks, involving propylitic alteration—are comparatively free from it. A vast proportion of so-called "talc," "clay" and "kaolin" is really sericite. Sericite forms from quartz in many rocks, though this action is less intense than in the case of the silicates.

AS TO the question, "What is steel?" "All metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation or converted, cast or made from iron or its ores, by the crucible, Bessemer, Clapp-Griffiths, pneumatic, Thomas Gilchrist, basic, Siemens-Martin or open-hearth process, or by the equivalent of either, or by a combination of two or more of the processes, or their equivalents, or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable iron castings, shall be classed and denominated as steel." Steel is an artificial compound of pure iron and carbon. The iron gives the strength and the amount of carbon regulates the hardness, toughness and ductility of the compound, so that the compound is kept low if a soft and ductile metal is desired for use in boiler plates, hoops, sheets or wire. It is carried somewhat higher for rails and decidedly higher for tool steel, cutlery and drills.

IN any given conditions minerals tend to assume the forms most stable under those conditions. Since the conditions prevailing during vein formation are very different from those prevailing afterwards, it may be inferred that the products of the first process might easily be changed. Such is, indeed, the case, as one finds many altered rocks which have evidently undergone more than one change. Especially near the surface, under the influence of oxidizing waters, the minerals formed in the rocks along veins are apt to suffer great changes. Examples are frequent, showing that the minerals which filled the open spaces along a vein have been completely dissolved and partly or wholly replaced by others. This is particularly true of fillings of calcite or baryte. Instances are known in which large masses of these minerals have been completely dissolved and replaced by quartz, as in the case of those of the De Lamar mine, Owyhee county, Idaho.

A PLANT to work the Hoepfner wet process for the extraction of copper at Papenburg, Germany, has a daily capacity of a metric ton of refined copper. The ore is first crushed in ball mills and leached with cupric chloride solutions. The solution dissolves copper, lead, nickel and silver, the cupric salt being reduced to the cuprous state. After purification and being freed from silver, the solution is allowed to flow to a compartment with carbon anodes and copper cathodes. Chlorine is liberated at the anodes, regenerating the cupric solution, which is returned to a fresh charge of ore. It is claimed that 91% of the contained copper was obtained after four hours' treatment of Rio Tinto ore containing 3.37% copper, and only 3% of the iron content dissolved. By longer contact 98.5% of the copper was extracted, with only 4% of the iron taken up. It is claimed, moreover, that 1 H. P. in twenty-four hours will produce fifty-four kilograms of copper, as against fifteen kilograms by the sulphate process.

THE total bullion product of the Con. Cal. & Va. mine, on the Comstock, Nevada, up to Oct. 1, 1896, according to the official statement of President Fish, was as follows: Gold $61,780,474.86, silver $69,856,832.96, total $131,637,307.82. Dividends: California $31,320,000, Consolidated Virginia $42,930,000, Con. Cal. & Va. $3,898,000, total $78,148,000. The Savage-Norcross-Chollar joint shaft, known as the Combination, is the deepest vertical shaft on the lode, having a depth of 3375 feet from the collar of the shaft to the bottom of the sump. This shaft has five compartments, requiring an excavation 40 feet in length by 10 feet in breadth to admit of timbering. The lowest workings in the Sierra Nevada, Union and Mexican joint winze reached a depth of 3200 feet below the surface. The Yellow Jacket new shaft had a depth of nearly 3000 feet, the Forman 2800. The Crown Point and Belcher lowest workings were at a depth of nearly 3000 feet below the surface. The Best & Belcher and Gould & Curry joint shaft, known as the Osbiston, had a depth of 2800 feet.

IF two or more own a mining claim in common, each co-owner, however great or small his share may be, has a right to go to work anywhere on the claim that he wishes to, so long as he does not interfere with any of his co-owners who may have gone to work before him. No agreement or understanding with his co-owners is necessary. If one (or more) of the co-owners in a claim commences operations on the claim, without any agreement with the other co-owners, he can take out ore and market it and can not be prevented except by process of law. If the proceeds of the ore exceeds all his expenses of mining and marketing it, he must divide the net profits with his co-owners, pro rata to their respective interests in the claims. If, on the other hand, he fails to realize enough to pay expenses, he can not hold his co-owners for any part of the loss. In case he refuses to give an account of his operations to his co-owners, they can sue for an accounting, and, if they so desire, can couple with the suit an action for the ejectment of the co-owner who is working the mine, and petition for a receiver.

IN Souter vs. Maguire (78 Cal., 543), it was held that where the locator of a mining claim marked the corners of the end lines, placed a stake or blazed a tree at each corner of the claim, and in places brushed out the lines, so that a person could get through, and placed a notice in the center of the claim defining the boundaries, that it was sufficient to justify a finding that he had marked off the boundaries as required by the Act of Congress. In the absence of State legislation, or local regulation, what constitutes a sufficient marking is a question to be determined by the jury according to the circumstances in each particular case. The Land Department of the United States (L. O. Regs., par. 15) recommends, and in many localities the custom prevails of driving stakes, building rock mounds, or blazing and marking trees, or brushing out along the end and side lines of the claim, and, in addition thereto, posting a notice in a conspicuous place on the claim, and sometimes marking the end lines of the ledge. The law does not require this character of marking; but inasmuch as it has been held by the highest courts to be a sufficient marking, it has been adopted by miners. Whether the boundaries of a claim are distinctly marked on the ground is in all cases a question of fact, and not of law. All that the law requires is that the location must be distinctly marked on the ground, so that its boundaries can be readily traced. This requirement is an imperative and indispensable condition precedent of a valid location.

Relative Values of Fuels Used on the Pacific Coast.

From Determinations Made by IRVING C. ALLEN, M. S., University of California.

The question of the relative values of fuels for producing heat and for convenience and desirability for use, in proportion to cost, is one of importance.

In addition to the article published in our issues of Sept. 15 and 22, on the use of "California Crude Petroleum as a Fuel," by Ernest H. Denicke, College of Mining, University of California, we have the results of some elaborate and exhaustive tests of coals and other fuels handled at San Francisco, which have been made by Irving C. Allen, M. S., College of Chemistry, University of California. This article is taken from a thesis, written by Mr. Allen, in which he gives at length his method of making these determinations, both mechanical and chemical, with descriptions of the apparatus used.

These tests, which include the leading coals handled at San Francisco, showing their exact comparative values for heat producing, and their chemical analysis, are the results of many months of careful, painstaking labor made by Mr. Allen as Assistant State Analyst, under the direction of Prof. W. B. Rising, Dean of the College of Chemistry. (Mr. Allen is now Government Chemist at Manila.)

We wish to call especial attention to his description and manner of using the Berthelot combustion bomb and accessories, an elaborate apparatus manufactured in Paris for determining fuel values, which description we copy in full from his thesis. The value of the calorie is stated to be "the quantity of heat required to raise the temperature of one gram of water through 1° Centrigrade."

The bomb used in these determinations was made by M. L. Golaz, Paris, and consists essentially of a cylinder of the best tool steel, 10 cm. external diameter at the base and reduced 8 cm. from the base to an external diameter of 7 cm. This cylindrical shell is 1 cm. in thickness and is nickel plated outside and porcelain lined within, and is of 586 c. c. capacity. On to this screws a cap with a hexagonal top, made to tighten with a large wrench, and is made tight with a lead washer and an iron shoulder. Through the center of the cap passes a conical-seated screwcock of fine nickel, made to admit oxygen. The body of the bomb is 16 cm. high, with the screwcock projecting 11 cm. above. Electrical communication is made with the interior of the bomb by well-insulated platinum wires passing through the cap. One of these wires is bent into a ring at its lower end and supports the small platinum dish containing the sample. One end of a small iron wire, used to ignite the coal, is wound tightly around each of these wires and completes the circuit within the bomb.

The calorimeter itself consists of a brass cylinder or cap 14.5 cm. in diameter and 23 cm. high, and contains 2300 grams of water, into which is immersed the bomb. This is protected from external thermal influences by an air jacket 1.5 cm. thick, a water jacket 7 cm. thick; and over the whole is a felt wrapping 1 cm. thick. The water in the inner cup is thoroughly stirred by a coiled agitator, worked by a string in the hands of the observer.

All observations were made at a distance of about 8 feet from the calorimeter, with the aid of a good telescope, in the following manner: About one gram of the sample is accurately weighed into the platinum cup and the cup placed in the ring of the binding post. A length of fine iron wire (No. 35) 7 cm. long, is made to loop under the surface of the sample in the cup, and each end is wound three times tightly about one of the binding posts, passing through the cup of the bomb. If the iron wire be much longer than 7 cm., beads of burning iron will drop during the combustion into the cup and fuse holes through the bottom. If the wire be not firmly wrapped about the binding posts, the current passing through the wire may not be sufficient to cause fusion, and the sample may not be ignited, and this necessitates opening the bomb and rewrapping the wire—a troublesome operation after the apparatus is set up. To make the fusion of the wire, an ordinary lighting circuit enters the laboratory, and from this is shunted through the bomb a small current of 4.6 amperes and of about one volt, of just about sufficient strength to cause fusion of the wire. In this shunt current there is a spring key, and by snapping this key a spark is struck, when all connections are properly made. If there be no spark, there is a faulty connection in the circuit, and it may be looked for either outside or inside the bomb and corrected. This spark is not of sufficient duration to cause fusion of the iron wire, and shows before any readings are made that the apparatus is properly adjusted.

All ragged edges of the lead washer are carefully cut away, for splinters of lead may cause leaks when the bomb is charged, and the screw threads are slightly vaselined, exposing no vaseline inside the bomb, and the cap screwed on. The bomb is gripped in a clamp fixed to the table and the cap tightened. Connection is made with the oxygen cylinders by means of a strong copper tube and oxygen run in until the manometer indicates a pressure of 25 atmospheres. (These cylinders are of heavy iron, of 6 liters capacity, and are charged with a pressure of 1100 pounds. When the pressure of any one cylinder falls below 25 atmospheres, the connections may be changed to a cylinder of high pressure and the bomb charged up to 25 atmospheres, thus utilizing the oxygen in the cylinders until the pressure falls as low as two or three atmospheres.)

The screwcock on the top of the bomb is closed and the bomb removed and placed in the inner cup of the calorimeter, into which 2200 grams of water have been accurately weighed. The thermometer—which reads to thousandths of a degree Centrigrade—and stirrer are adjusted and the stirrer run for five minutes before any readings are made. After five minutes a reading is taken at the end of each minute until a series of five concordant readings are obtained, and the initial temperature, i. e., the temperature of the calorimeter bath before the ignition is made, is ascertained. The shunt circuit is completed for five seconds and the sample is ignited by the fusion of the iron wire. After the lapse of about ten seconds the temperature will rise rapidly for about four minutes and while during this time no readings of the thermometer are possible, the time must be recorded, and when the temperature begins to fall regularly a series of readings must be made—one each minute for from ten to fifteen minutes. The average rate of cooling or radiation after ignition is ascertained. Assuming that this radiation represents the cooling from the instant of ignition—which is not absolutely true, as the radiation from the calorimeter bath immediately after ignition is necessarily less than when the temperature of the bath has risen 3° or 4°; the temperature is calculated at the instant of ignition. This temperature, corrected for radiation, is the temperature to which the calorimeter would rise if subjected to no external thermal influences. As there were 2200 grams of water in the calorimeter bath, and the water equivalent "E" of the calorimeter is ascertained to be 521 calories, the increase of temperature over the initial temperature multiplied by 2721 indicates the calories liberated by the combustion of fuel and iron wire.* Deducting the calories liberated by the weight of iron wire used, the calories liberated by the sample of coal is ascertained.

The bomb and calorimeter are illustrated on the front page. The plate represents the bomb and calorimeter disconnected; BC = bomb cylinder; BK — bomb cap; D = combustion dish; B = base for cylinder; P = binding posts; S = stirrer; A = agitator; C = calorimeter cup; M = mirror; T = thermometer.

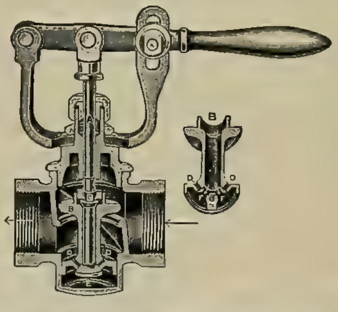
* According to Berthelot, 1 gm. of pure iron wire, burning to Fe_2O_3 liberates 1576 8 calories.

◆

A New Throttle Valve.

The Pendry balanced throttle valve, shown in section in the accompanying cut, is considered by the makers well adapted for use on hoisting engines, marine engines, steam shovels and on all quick acting engines, as by means of it the full boiler pressure can be instantly admitted to the cylinders and as instantly shut off. In addition to its quick opening feature, it is also a perfectly balanced valve, and so can be easily operated, no matter how great the steam pressure being used.

Its operation is as follows: The stem A forms two seats with the main valve B—one at its upper and one at its lower end. The first slight movement of the handle will raise the stem A off its upper seat. The steam passes in through this opening, down through the body of the valve B in the space around the stem and into the balancing chamber E through the openings marked F on the small sectional view of the valve body to the right. In this way the full boiler pressure is admitted into the chamber E, balancing the valve; and, as the same pressure is below as above it, it is very easily operated. While this valve is primarily a quick opening one, it can be opened as slowly and as gradually as a screw stem valve, and will stay open at any point one may desire to set it. This feature makes it adapted for use on all types of steam engines. The question of leakage can also be prevented in this valve, as it has but one seat, and this can be ground the same as that of a globe valve. A circular giving full description may be had by addressing the manufacturers—The Detroit Lubricator Co., Detroit, Mich.



Pyritic Smelting in the Black Hills.*

NUMBER IV.—CONCLUDED.

In the replacing of lime with magnesia, the formation temperature rises rapidly until one-eighth of the lime has been replaced with magnesia; then it falls until one-fourth has been replaced; then rises until one-half has been replaced, and suddenly falls until five-eighths have been replaced, and then rises rapidly until the whole of the lime is replaced, where it reaches a formation temperature too high for metallurgical work.

The curve, after the addition of magnesia, while it falls at two points rather low, at no time reaches the line of the basal or normal lime-iron silicate.

That the same or a similar curve would be obtained if a different percentage of silicate were used—as, for instance, our Deadwood slags—is probable; but the use of magnesian limestone for our slags was preferred to the pure limestone. Nothing like a scientific attempt was ever made to determine the formation point of our slags, hence I can not say that they were less fusible than they would have been with all lime and no magnesia. They did seem more liquid, and certainly less magnesian limestone was required for the same work. This was due, of course, to the lower combining weight of magnesia. One part by weight of silica to form a bi-silicate slag requires 0.93 parts of lime, but only 0.66 parts of magnesia.

Again, the Hofman curves show that the formation temperature falls when lime is replaced by alumina. It falls below the line of his basal silicate until as much as three-fourths of the lime has been replaced by alumina. The slags, however, were very viscid. Now, if magnesia raises the formation point above the normal, and alumina lowers it, the net results might be, in our slags, not only to cancel each other's effects, but to give a more fluid slag, owing to the multiplication of bases, which in a general way is known to have that effect.

In pyritic smelting the slags must possess distinct characteristics—even if accomplished at the sacrifice of other points. First—They must be of low specific gravity, owing to the low specific gravity of the matte, that a perfect separation may be had by gravity. The high silica, lime, alumina and magnesia, and low iron, tend to bring this about. Second—In order to have time for the matte to settle out they must not chill it too quickly. It is desirable, therefore, to form a slag which will remain fluid as long as possible. The low formation points of the high silica slags tend, I think, to aid this.

Before the appearance of Prof. Hofman's paper the peculiarities of slags were known only in a general way; and, speaking for myself, I knew more from the work of Percy and Smith than from any other sources. Percy did not, however, do more than to make mixtures and melt them in crucibles and note the results. In determining what silicates I could make at Deadwood I simply followed the Percy–Smith methods; but by the aid of Prof. Hofman's paper it is now possible for the first time to predict what effects certain elements will have. In new work that I am doing for a matte smelting plant at Buena Vista, Colo., and another for Cripple Creek ores, I have found this paper of great value.

TABLE III.—BALLING'S TABLES FROM "COMPENDIUM DER METALLURGISCHEN CHEMIE."

One part by weight of silica requires	Parts by weight of bases	One part by weight of bases requires	Parts by weight of silica
For singulo-silicates:		For singulo-silicates:	
Lime	1.86	Lime	0.535

In our slag calculations we saved time by the continual use of Balling's well-known tables. The problem in our sort of smelting is very simple. We determined by means of the second table how much silica was fluxed by the iron, lime, etc., contained in the ores, subtracted it from the total amount to be fluxed, and then, by means of the first table, sought how much limestone must be added to take care of the remaining silica. Of course, a chemist can do all this without the aid of tables, and, moreover, since the publication of Robert Austin's work and of Hofman's "Lead," these tables are easily obtainable. That they may be still more easily had I give them here, feeling that their publication by the Institute will be appreciated.

If any one doing this kind of smelting will keep his slags between $4RO, 3SiO_2$ and RO, SiO_2, his troubles will be few, provided he has proper bases—i. e., lime and iron, etc. If there is a trade secret about matte smelting for gold and silver, it is this only. The Balling tables will enable the most ignorant to observe these limits. The "typical" slags of Iles, Eilers, Schneider, Raht, Hahn, Page and Livingston may be left as guides for the lead smelters, who have need of them by reason of a widely different problem. To the matte smelter they are not only useless, but confusing, and, I believe, often the cause of failure. With the iron matte low in copper, it is immaterial whether a little more or less iron goes into the slag. The resulting matte will carry the gold and silver in any case. The smelter in this line is not concerned with problems relating to the scorification of copper and lead.

REFINING AND DISPOSITION OF THE MATTE.—With iron matte, or matte very low in copper, there exists usually no problem, for it can be sold to the lead smelters. With high percentages of copper in the matte, however, there is a difficulty. It carries usually too much gold for the ordinary copper refineries, and too much copper for the lead refineries.

At one time, about 1892–93, we had a difficulty in disposing of our matte. We erected a lead furnace, bought lead ores, and crushed and added the matte raw to the lead charge. I found that the matte gave up nearly the whole of its gold to the lead. It still contained much silver. This matte was very different from the "first matte," and for want of a better name we called it after the Germans, "herd rohstein" (hearth matte), and added it to the matte smelting charge, but, owing to its containing lead, this treatment had not much success, as the lead was lost. The resulting bullion in the lead process—very high in gold—was sold to the lead smelters. Fearing that they might decline to buy this, also, we erected one very large cupel, and two smaller ones, all of the English type, intending to cupel the bullion and add the resulting litharge to the lead process. The whole process was borrowed from pyritic smelting as it is practiced in Kongsberg and in Russian Siberia, save that I used an ordinary American lead smelting furnace, and English cupels. The process, except as to the loss of lead in the matte furnace, was promising, and, in the favorite language of the patent right man, "continuous." The "first matte" went into the lead furnace, the second or hearth matte back into the matte furnace. The lead bullion went to the cupels, and the litharge back to the lead furnace. I do not know how this experiment would have ended, for our difficulties with the lead smelters were adjusted and our relations with them ever afterwards remained of the most pleasant character.

The idea of refining, however, continued with me, and in connection with Arthur Howe Carpenter I made many experiments, sometimes original, but more often after the lines laid down by the old metallurgists, who seemed to have covered, in theory at least, about everything. The most satisfactory process, and the one I should have followed had I remained at the works, was that laid down by Jars (I think in 1784) and quoted by Percy in the first edition of his "Metallurgy." Afterwards it was patented by the Vivians and others, and forms the first step, at least, of the Argo process. It will be remembered that our process was mainly for gold, and that copper matte so high in gold was not desired by electrolytic copper refiners. Any process that would take out the gold and other "impurities" would fit it for their process. The first step is the well known copper-bottom process described for us by Dr. Pearce in his presidential address. I proposed not to try to separate the silver from the matte, but to proceed at once to the copper-bottom process, which I thought might be performed either by the French "selecteur" method or as is now done at Argo.

The resulting product—high-grade copper matte—having given up nearly all of its gold and much of its silver, could be blown up to blister copper and sold directly to the refiners. The copper bottoms I granulated, oxidized and cast back into matte and effected a second "selecting," similar in all respects to the first.

This selecting process is not wholly successful unless the copper matte is impure, a certain percentage of lead being necessary. This lead is, of course, concentrated in the first bottom or "selecting," so that this carries a very large percentage of lead. In the second selecting this is so increased that the resulting bottom may be at once cupelled—often requiring little or no additional lead. In fact, the first bottom can be directly cupelled, with the addition of lead, if so desired, the coppery litharge being, as shown by Samuelson, even more fusible than the purer litharge of the ordinary methods. In practice six parts of lead to one of copper give very satisfactory results. The coppery litharge forms a product which can be treated by the lead smelter, who has but to add to it his ore charge—the lead going to the bullion and the copper to the matte.

It is unnecessary actually to repeat the selecting process in all its details upon the first bottoms as above described. Equally good results, with much less trouble, can be had by simply returning the first bottoms, or "plates," to a reverberatory furnace, with additional sulphide material, and running them over and over until they are sufficiently reduced in size for final treatment by cupellation with metallic lead. The resulting coppery litharge is easily reduced to metallic lead and matte by treatment in a small reverberatory or "softening" furnace, with galena or iron pyrite. The lead may be used over and the matte is returned to the ore smelting.

Factors of Safety.

TO THE EDITOR:—In the enclosed clipping the statement is incorrect, and might get some engineer or boiler owner into serious trouble if followed:

> In the case of a boiler 72 inches diameter, double-riveted lap seam, $\frac{11}{16}$-inch rivets spaced 3 inches between center, thickness of plate $\frac{9}{16}$ inch, of 60,000 pounds tensile strength, the safety valve should be set to relieve the boiler at 130 pounds.

First, the United States factor for safety on steam boilers is $4\frac{2}{10}$ for punched holes and $3\frac{5}{10}$ for drilled holes. Philadelphia city law, also the English, French and Russian laws, require a safety of 5, whereas in the example given the safety factor under 130 pounds steam pressure would be $2\frac{37}{100}$, or just a little more than twice the steam pressure carried.

Second, the size of rivets given ($\frac{11}{16}''$), $\frac{3}{4}''$ holes, is entirely too small for $\frac{9}{16}''$ boiler plate. They should be $\frac{15}{16}''$ rivets driven in 1°″ rivet holes pitched about $2\frac{3}{4}''$, centers, to get a fair joint.

The average shearing resistance of good iron rivets in a lap joint (single shear) is 38,000 pounds per square inch of section.

Taking the example as given, it would work out as follows: Boiler 72″ diameter, $\frac{9}{16}''$ plate, 60,000 pounds T. S., $\frac{11}{16}''$ rivets, $\frac{3}{4}''$ rivet holes, 3″ pitch. $\frac{9}{16}''\times3''\times60{,}000$ T. S. $=101{,}250=$ solid plate. $3''-.75=2.25\times60{,}000=75{,}537$ net section. (Rivet hole $=\frac{3}{4}''$) $.75\times.75\times.7854=4417$°″ $\times\,38{,}000=16{,}784$ pounds shearing resistance of one rivet. Two rivets $=16{,}784\times2=33{,}568$ pounds. The rivets are the weakest; therefore the strength of the rivets divided by the strength of the solid plate $=33{,}568\div101{,}280=33\frac{1}{10}\%$ as the efficiency, or percentage of the joint to the strength of the solid plate. (It should be 70%.)

Then, $.5625\times60{,}000$ T. S. $\div\,36''$(radius) $=937\frac{1}{2}$ pounds as the bursting pressure of the solid plate. Then, $937\frac{5}{10}\times33\frac{1}{10}=310$ pounds as the bursting pressure of the seam. Then, $310\div4\frac{2}{10}$ as the safety factor required by United States law for punched holes $=73\frac{8}{10}$ pounds as the safe working pressure; if the rivet holes were drilled, then $310\div3\frac{5}{10}=88\frac{6}{10}$ pounds as the safe working pressure.

If the joint had been properly proportioned, then the safe pressure for drilled holes, according to the United States law, would be $937.5\times70\%=686$ as the bursting pressure of the seam; then, $686\div3\frac{5}{10}=193$ pounds as the safe working pressure.

J. B. WARNER,
Chief Inspector, San Francisco.

Witte Gas and Gasoline Hoist.

The latest improved Witte gas and gasoline hoist, illustrated on the front page, is designed to use any grade of gas or liquid fuel capable of generating heat, but fuel which leaves no sediment. The hoister bed has bolted to it the engine and all the working parts, levers included, only one foundation being necessary. A loose drum is bushed with phosphor bronze; bearings have large spring grease cups to properly lubricate them. The gears, being on the outside of the hoister bed, can be changed to any ratio capable of speed required for different classes of work. The hoist is so constructed that different size drums may be furnished for the different classes of work. The hand levers are so arranged that the tripping device may operate with the palm of the hand or fingers by changing a pin. There are six key seats for the adjustment of the power thrust screw, and the speeder attachment, being on the inner side of the flywheel, permits easy starting. The engine is dowel-pinned onto the hoister bed to prevent movement. The two flywheels of the engine are close up to their main bearings, to prevent springing of the crank shaft. Full instructions and drawings accompany each machine, to enable any one to set it up. The Witte Iron Works, Kansas City, Mo., furnish a guarantee for five years, covering any defective workmanship or material. They are represented in San Francisco by the Tracy Engineering Co.

THE Wetherill patents for concentrating weakly magnetic materials have been contested in Germany, and, after an exhaustive examination of the grounds of contest, the examiners have fully sustained the validity of the Wetherill patents.

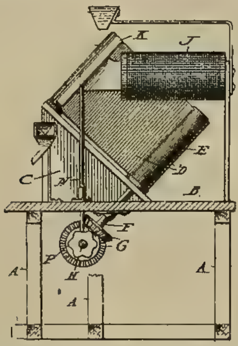
THE Master Mechanics' Club of Cripple Creek district, Colo., has been organized, meetings being held weekly, at which papers of interest to the profession are read by members, and social relations cultivated.

Mining and Metallurgical Patents.

Patents Issued November 27, 1900.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

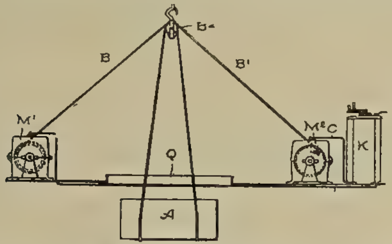
APPARATUS FOR SEPARATING GOLD FROM MAGNETIC SANDS.—No. 662,409; E. Gates, Chevy Chase, Md.



Apparatus for separating gold from magnetic sand, pole piece provided with wavy or zigzag grooves containing filling of diamagnetic material, means for energizing magnet just sufficiently to cause sand to lose its otherwise amorphous arrangement and to assume arrangement of frond-like structure, apron extending across magnetic field over which material is fed, means for causing apron to travel in direction transverse to feed of material, means for imparting succession of slight vibrations to apron, means consisting of plate underlying apron, and rod and cam for jigging plate.

◆

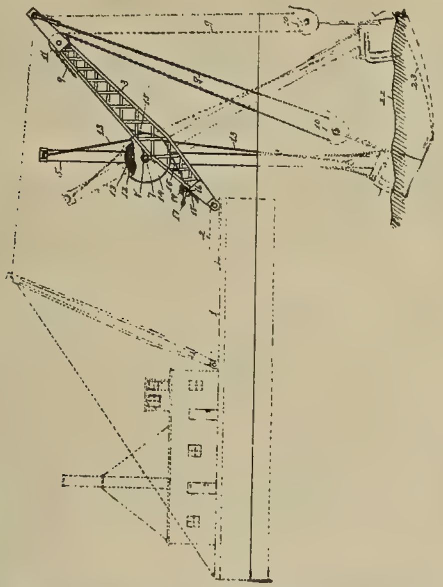
CONTROLLER FOR ELECTRIC MOTORS.—No. 662,450; J. B. Linn and M. W. Day, Schenectady, New York, assignors to General Electric Co., of New York.



Combination in controlling device for electric motors, two independent controlling switches, reversing switch, independent means for operating switches, interlocking device for effecting, when desired, simultaneous operation of controlling switches, second interlocking device for preventing operation of reversing switch when either of controlling switches is in operative position, and for preventing operation of either of controlling switches when reversing switch is open.

◆

DREDGER.—No. 662,462; R. R. Osgood, Lansingburg, N. Y.



In an excavator, combination with trunnion-supported sleeve; of dipper handle reciprocatory therein, means for swinging dipper handle; drum rotatively supported concentric with but independently of sleeve; cables oppositely wound upon drum and connected with dipper handle near its opposite ends; means for controlling rotary movements of drum.

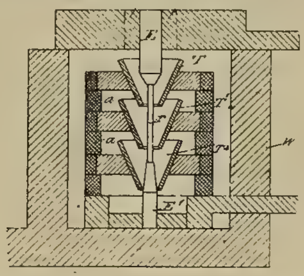
◆

PROCESS OF HARDENING IRON OR STEEL.—No. 662,502; L. Schiecke, Magdeburg, Germany; assignor to O. Gentsch, same place.

Process for hardening steel and iron, consisting in heating of piece to be hardened within coating composed of pounded charcoal, corn flour, slaked lime and neat's-foot oil; cooling red hot piece in water with addition of sal-ammoniac and layer of oil to exclude air; sinking piece into mud of argillaceous substances contained at bottom of vessel until cooling is complete.

◆

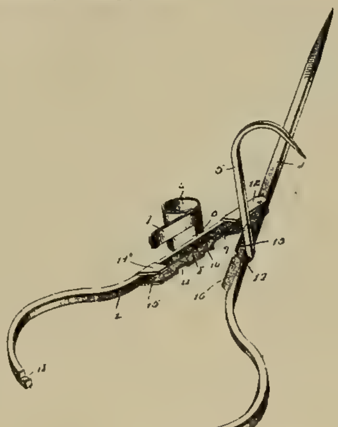
ELECTRIC SMELTING FURNACE.—No. 662,537; H. Koller, Nuremberg, Germany.



An electric furnace having vertically disposed current-feed electrodes, vertical series of superposed disconnected hopper-shaped electrodes arranged between feed electrodes and means for insulating them one from other and from current electrodes, lower smaller end of one hopper extending into top larger mouth of hopper below it.

◆

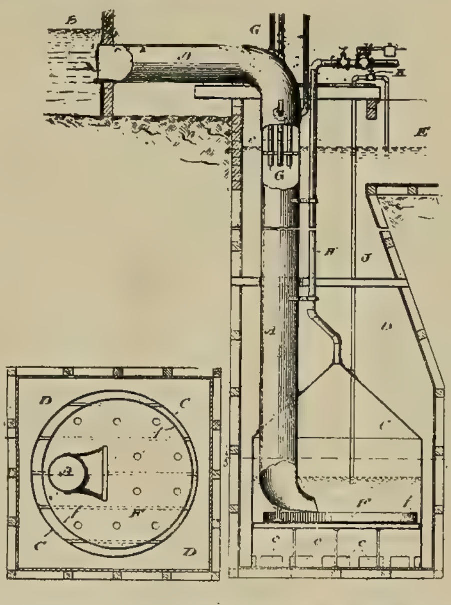
MINER'S CANDLESTICK.—No. 662,565; A. Howard and J. Howard, Ouray, Colo.



A miner's candlestick, comprising piercing member having cutter, coacting member pivoted thereto having lateral under flange, lateral top flange at one end, and lateral top flange opposite one portion of cutter, former member having portion of its cutting blade adapted to engage with under flange, a portion having its cutting edge adapted to enter between opposite top flange and under flange.

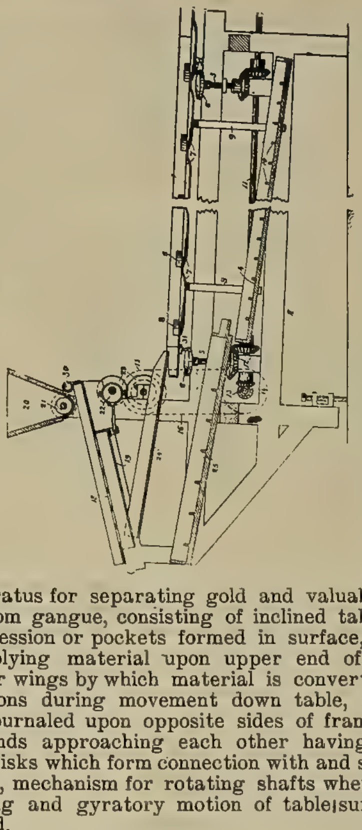
◆

HYDRAULIC AIR COMPRESSOR.—No. 662,884; F. C. Starke, Milwaukee, Wis.



In hydraulic air compressor, combination of descending water conduit or pipe having water intake opening and air inlets at upper end and laterally directed and horizontally extended discharge opening at lower end of conduit or pipe projects and opens, ascending water conduit leading out of lower part of chamber and having discharge opening below water intake opening at upper end of descending conduit, horizontally disposed spreading table located in chamber between outlet and discharge opening of descending conduit, air-delivery pipe leading out of upper part of chamber.

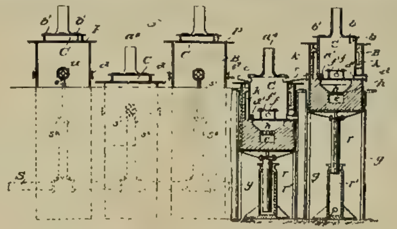
SEPARATOR AND AMALGAMATOR.—No. 662,685; J. P. Clarke, Alameda, Cal.



Apparatus for separating gold and valuable material from gangue, consisting of inclined table having depression or pockets formed in surface, means for supplying material upon upper end of table, guides or wings by which material is converted into depressions during movement down table, inclined shafts journaled upon opposite sides of frame with upper ends approaching each other having crank pins or disks which form connection with and support for table, mechanism for rotating shafts whereby an oscillating and gyratory motion of table surface is produced.

◆

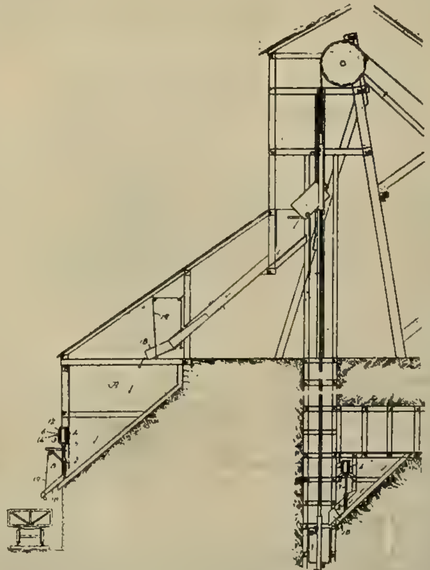
APPARATUS FOR REFINING AND DESILVERIZING LEAD.—No. 662,836; S. Tredinnick, Butte, Mont.; assignor of one-fourth to A. Wetzstein, same place.



Apparatus for refining and desilverizing lead, comprising series of kettles, means for connecting kettles for effecting discharge of contents of one into another, hydraulic cylinders on which kettles are mounted, fluid tank, pump, connections between tank and pump and pump and cylinders to supply fluid to raise cylinders, and connections for exhausting fluid from cylinders back to tank.

◆

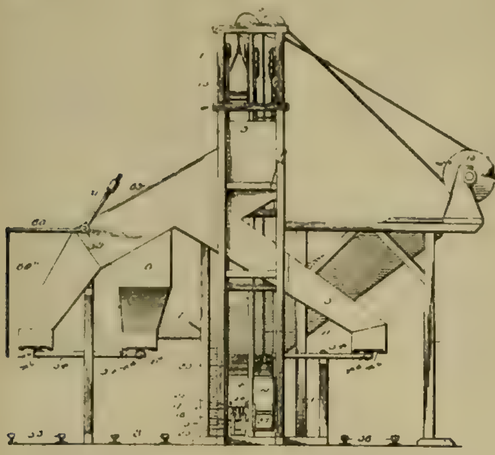
CHUTE CLOSURE.—No. 662,672; J. S. Hickey, Anaconda, Mont.



Combination of bin for ore or coal, discharge chute connected with bin, cut-off gate disposed transversely in chute and movable in right line therein, gate and bottom of chute being arranged at an acute angle with relation to each other and converging in direction of lower line of force represented by moving mass descending chute, discharge portion of chute extending beyond gate, motor connected to gate and adapted to force same through mass of material and thereby close chute, hinged, counterweighted apron at discharge end of chute.

◆

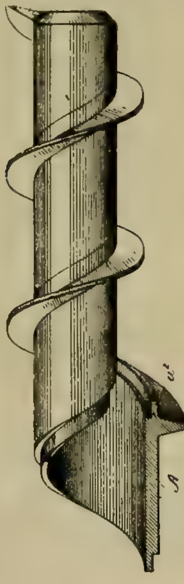
MINING ELEVATOR.—No. 662,731; R. Lee, Sherrard, Ill.



In an elevator, series of chutes, with feeding-hopper, one chute having its receiving end adapted to be closed by slide or door, a counterbalancing lever, having axial rod or fulcrum provided with flexing or jointed arms connected by door or slide.

◆

COAL DRILL.—No. 662,646; M. Hardsogg, Ottumwa, Iowa.



Drill made from strip of metal cut away on interior face to form shouldered overlap and cut away on exterior edge to form shouldered underlap and provided on exterior face with continuous longitudinal triangular shaped rib, for winding of strip on itself to bring shouldered laps into engagement and form hollow body having continuous smooth interior for drill and to cause rib to form continuous elevating spiral on exterior face of body and permitting sharpening of drill by grinding rib.

The Lunkenheimer Co.

THE LUNKENHEIMER COMPANY.

The new machine shop building which the Lunkenheimer Co. has just completed, Fairmount, Cincinnati, O., is 90 by 172 feet long, two stories and basement, built on the usual machine-shop gallery style of construction. There is a traveling crane 30 feet wide which runs the full length of the building, leaving galleries on the second floor, on both sides, 30 feet wide. The construction is steel throughout and designed to safely carry a load of 300 pounds per square foot. This building was erected for the purpose of taking care of three important departments of the company, viz., iron valve, injector and safety valve. By the erection of this new building the manufacturing facilities have been increased about 25% and employment is given to 100 men, in addition to the force already operated, bringing the total force up to 500 hands, all of whom are engaged in the production of high-grade brass and iron goods and engineering appliances.

Use of Hot Blast in Smelting.

TO THE EDITOR:—As to the use of the hot blast in smelting, one of the first and most important items to consider when heating the air blast is that it in no way interferes with the regular working of the blower, as the blast passes through the blower cold as in the ordinary way, so that all calculations as to the amount of blast required and used can be based on the regular volume handled by the blower, the same as when using cold blast, and it is customary to calculate the amount of blast furnished by the tables sent out by the manufacturers of the different blowers. In this way the amount of free oxygen sent into the blast furnace, whether heated or cold, can be calculated provided there would be no obstruction to the free passage of the air through the heating apparatus. It is therefore necessary that the area of the heating box shall be sufficiently larger than the inlet where the cold blast enters that no back pressure is created, and the outlet of this heating box shall be made with nearly double the capacity of the inlet on account of the increased volume of blast occasioned by the heating process.

The first heat required is for heating the air blast up to the temperature when the oxygen will combine with either the carbon of the coke or the sulphur contained in pyrites; then the necessary heat for melting ores and fluxes so that they will combine to form the proper silicates for fluid and clean slag is produced by the oxidizing of the fuel added to the charge by the free oxygen contained in the blast. If a cold blast is used, all the free oxygen going in with it is required to oxidize the extra fuel required to heat the blast, thus leaving none for the sulphur. If more cold blast is used, so as to get still more free oxygen, it drives the heat still farther away from the tuyer openings into the furnace and reduces the smelting area of the furnace in that proportion, driving the heat higher up in the furnace, burning the fuel and smelting the ore so near the top of the furnace that any metals volatilized have no chance to get caught by filtering up through the cool layers of ore charges on the top, and keeps the fuel burning so high above the tuyers that it leaves very little for the blast to encounter as it enters unless a very large quantity has been used.

When the cold blast enters the furnace from the tuyer openings, and encounters the hot material without fuel mixed with it to generate the heat, a crusted furnace soon becomes a consequence starting at the tuyer nozzle and reducing the capacity of the furnace until it closes it. This is the result when either too much cold blast is used or too little fuel is used with the cold blast. By the use of the hot blast this trouble is greatly decreased, and the hotter the blast is the better it is, up to a point where all the remaining heat necessary for smelting can be produced by the combination of the oxygen in the blast with easily oxidized elements in the ore, such as sulphur, arsenic, etc., etc. When these elements are not in sufficient quantity to produce by oxidation the balance of the heat without making too high a concentration, i. e., not having enough sulphur to make matte for the regular clean working of the furnace, then sufficient fuel should be used in order to save the necessary sulphur for making a proper grade of matte, so that with a hot blast, a cool top, and careful feeding, a more uniform grade of matte is made than has ever been possible to make by the use of the cold blast. At the same time there is less loss of precious metals by volatilization.

The advantages of a hot blast over a cold blast are in the improved chemical conditions, economy of fuel, and the greater capacity of the furnace. Where the blast is heated without any expense, every degree of heat so obtained is a saving of that percentage of coke needed for fuel in the working of the furnace. As a matter of fact, the saving goes beyond that point because of the fact that the cold blast chills the charge at the point of contact in the furnace from each one of the tuyers, thus reducing the activity of the coke furnished and imposing an increased demand on its utility.

This chilling action reduces the capacity of the furnace in proportion to the area occupied by the chilled portions, and as near the nozzle of each tuyer will be found a large surface of the charge chilled below the fusing point by the action of the cold blast, which by the use of the hot blast would be kept active, this proportion cuts a material figure, so that the use of the hot blast in that direction alone is a decided advantage. As a matter of fact, it has been found in the practical working of furnaces on a large scale that it is advantageous to heat the blast by separate ovens running at a heavy expense for fuel where the expense for fuel in operating the ovens for heating the air was more than double the saving of the fuel in the furnace charge. It was found that the increased capacity of the furnace and the improved chemical conditions which result in bringing about a more thorough fusion of the ore more than compensate for the extra cost of the fuel to heat the air. This fact having been demonstrated on a large scale by successful smelting companies, one can see how much advantage it will be in the cost of operating any furnace where the air can be heated automatically without any cost; and, realizing the field for the improvement in that direction, several inventions have been brought out to accomplish that end. Most of those I have seen utilized the heat escaping from the fumes of the furnace by means of coils of pipe at some distance above the feed floor of the furnace. Where a furnace is properly fed and properly operated so as to prevent volatilization of the precious metals, there should be very little heat above the feed floor, so that to utilize the invention it is necessary to keep a strong blast running through the entire charge of the furnace, igniting the free atoms of sulphur and the coke on the top of the charge, thus causing a heavy loss by volatilization where the ore contains any tellurides, lead or other volatile substances, and thus destroying a great portion of the fuel heat before the charge reaches the oxidizing portion of the furnace. In other cases, attempts have been made to use the waste heat escaping from the slag, but in doing so they have been taken in such a way that the fumes from the slag were driven back into the furnace again; thus furnishing an impure blast with a great portion of the free oxygen already removed. The object of my researches has been to secure a hot blast which would furnish the air heated to a sufficient degree of heat to prevent chilling, at the same time increasing the capacity of the furnace and minimizing the use of fuel, and to accomplish this without any additional cost for operation. This I have been able to do by what is known as the Bretherton hot blast apparatus, and in constructing this apparatus I have kept in mind the principal features required for its successful operation, doing away with the back pressure on the blower so that the volume of air would not be minimized, taking the heat from the escaping heat of the hot slag by building an oven around the fore-hearth, the oven having flues passing through it for the escaping fumes of the slag, similar to the flues of a boiler, and have augmented the heat acquired in that manner somewhat by using a set of air jackets above the water jackets around the furnace, the air having a continuous passage from blower to tuyers. In this way I have been able to keep the top of the furnace cool so as to prevent volatilization.

Denver, Colo. S. E. BRETHERTON.

California Miners' Association Committees.

The following are the committees of the California Miners' Association for the ensuing year:

Executive Committee at Large:—J. H. Neff, W. C. Ralston, T. L. Ford, A. D. Foote, E. Coleman, C. H. Lindley, C. G. Yale, W. W. Montague, J. J. Crawford, B. N. Shoecraft, M. E. Dittmar, L. Glass, L. P. Crane, C. T. Deane, D. McClure Jr., G. E. Dow, J. W. C. Maxwell, C. M. Belshaw, E. A. Belcher, W. P. Hammon, J. F. Halloran, J. McMurry. W. S. Keyes, W. H. McClintock, W. G. Dodd, D. T. Cole, H. T. Power.

County Executive Committees:—Alameda: F. A. Leach, S. B. Christy; Amador: J. F. Parks, R. Tregloan; Butte: O. P. Ormsby, F. W. Griffin; Calaveras: F. F. Thomas, A. J. McSorley: El Dorado: W. A. Winsboro, C. H. Weatherwax; Fresno: A. R. Briggs, W. H. McKenzie; Inyo: J. J. Gunn, J. E. Meroney; Kern: B. T. Price, T. B. Treadwell; Mariposa: A. H. Ward, N. C. Ray; Mono: R. T. Pierce, J. S. Kain; Northern California: C. C. Bush, C. D. Galvin, E. B. Edson; Nevada, J. S. McBride, W. F. Englebright; Placer: F. Chappellet, I. H. Parker; Plumas: A. B. White, S. W. Cheyney; Sierra: F. S. Moody, F. R. Wehe; Shasta: L. T. Wright, F. Hurst; Solano: A. C. Holly, A. Tregidgo; Santa Clara: T. Derby, E. W. Carson; San Francisco: J. O. Harron, L. W. Harris; Sacramento: J. H. Batcher, A. W. Hinkson; Sonoma: A. Abbey, C. A. Grimmer; Southern California: H. Z. Osborne, C. A. Burcham, D. Murphy; Tuolumne: W. R. Gillis, O. F. Greely; Yuba: W. B. Meek, J. E. Durfee.

Committee on Finance:—A. Carrigan, J. Sloss, W. G. Dodd.

Committee on Legislation:—J. F. Davis, C. H. Lindley, W. B. Lardner, J. R. Tyrrell, W. C. Ralston, F. L. Stewart, F. S. Moody, A. E. Muenter.

Committee on Lands:—J. M. Wright, C. G. Yale, M. B. Kerr, H. E. Pickett, B. S. Rector.

Committee on Department of Mines and Mining.—W. C. Ralston, Irving M. Scott, J. F. Halloran, C. G. Yale, W. S. Keyes.

Committee on Dams:—A. Caminetti, J. Spaulding, F. Searles, J. S. McBride, M. B. Kerr, A. C. Hinkson, J. O'Brien, W. B. Meek.

Oil and Gas Yielding Formations of California.

NUMBER III.

The following is a continuation of the advance sheets of the official report on the oil formations of California, written by W. H. Watts, and shortly to be issued by the State:

The asphaltum deposits at Asphalto are found under two conditions: (1) as superficial deposits of impure asphaltum, and (2) as veins of asphaltum in the Middle Miocene formations. The superficial deposits of asphaltum have been formed by exudations of heavy oil. They originally covered a good many acres and were from 1 foot to 12 feet thick. This asphaltum varies greatly in quality. Some of it is brownish in color and resembles ironite. It is frequently dry and powdery and more or less mixed with earth. The best asphaltum in these superficial beds lies near the surface. In some places it forms a stratum varying in thickness from a few inches to 2 feet or more. This stratum consists principally of a dull black, compact asphaltum, but some of it possesses a pitch-like luster, and here and there it is rendered viscous by fluid petroleum. Beneath the upper stratum the asphaltum is frequently impure and rotten and interbedded with drift. Attempts to mine and refine this asphaltum have proved unprofitable.

The principal asphaltum mines are 1½ miles southeast of McKittrick. In these mines the asphaltum occurs as irregular veins and intrusive masses in the Middle Miocene rocks. These veins are from a few inches to 5 feet or more in thickness. In one of the workings that the writer examined in 1894 the foot wall is light-colored clay and the hanging wall soft sandstone.

In a cut made by miners who were prospecting for petroleum in the N.E. ¼ of S. 34, T. 30 S., R. 22 E., M.D.M., several strata of impure asphaltum 1 inch to 1 foot in thickness were cut through. The asphaltum was found to be interbedded with thin strata of light-colored clay, sand and pebbles. One of the uppermost strata, which is composed of dark-colored sand, is fossiliferous and contains fresh water shells.

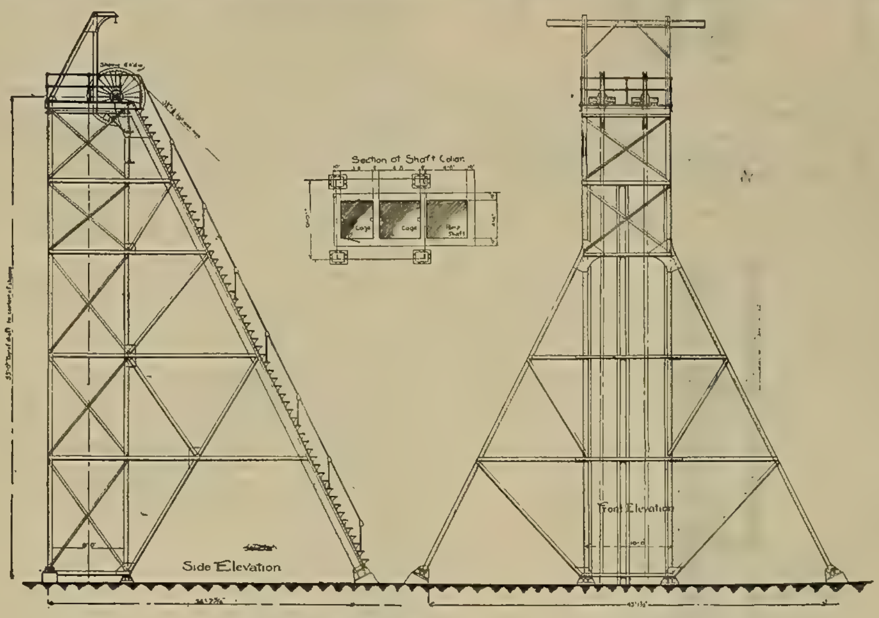
In the Coalinga district oil mining has been carried on in two fields, in the Oil City field, which lies to the north of the north fork of Los Gatos creek, and in the Alcalde field, which lies between Alcalde creek and the north fork of Los Gatos creek. The most important of these fields is the Oil City field, about 9 miles north of the Coalinga railroad depot, on the Southern Pacific Railroad. The lowermost formation consists of hard sandstone containing numerous concretions. This sandstone is overlaid by dark-colored shales and sandstone containing Eocene fossils. Some of the strata of sandstone interbedded with dark-colored shales yield an oil of low specific gravity, and have proved very productive. The shales and concretionary sandstone on which they rest are of Eocene (Tejon) age. Resting nonconformably on the Eocene rocks is a light-colored siliceous shale, hereinbefore mentioned as belonging to the Lower Neocene series. Seepages of heavy, tar-like oil issue from this shale, and in some places form beds of asphaltum. In some of the wells in this vicinity an oil of 18° B., apparently from oil sand in this formation, has been obtained. The light-colored shale is very much contorted and the exposed rocks for the most part stand at a greater angle than do the underlying or overlying rocks. Resting nonconformably on the light-colored shales is a series of sandstone and shales—sandstone predominating—which contains numerous fossils and represents the Middle Neocene formation. In most places it dips to the east of south at an angle of less than 25°. In this formation immediately overlying the siliceous shales are strata of oil sand, beds of gypsum, which at one time were mined, and diatomaceous rocks impregnated with petroleum, the last named resembling the diatomaceous rocks seen at McKittrick, in Kern county. The upper portion of the Middle Neocene formations in this locality is characterized by a soft bluish sandstone and fine conglomerate containing fossils of the Middle Neocene age. The soft bluish sandstone dips east of north at an angle of 10° to 15°.

(TO BE CONTINUED.)

An Explosion of Scientific Interest.

A singular though not unprecedented accident took place at the Mammoth mine, in Utah, recently, illustrating applied thermo-dynamics in an interesting but fatal manner, causing the death of one and the severe injury of another of the engineers of the mine, says Prof. R. H. Thurston in Science. The cylinder of an air compressor exploded while in operation in regular work, and with such violence as gave evidence of more than the action of the normal air pressure in its production. The back cylinder head and the cylinder itself were shattered. The violence of the explosion was terrific. The two men were thrown across the room and badly mangled and one instantly killed. Fragments of metal and flesh were found outside the building and a long distance away. The air pressure, at delivery from the compressor, was but eighty pounds per square inch. The cause of the explosion is presumed to have been the compression of the vapors of petroleum given off by oil used for lubrication in too large quantity and of too light a quality. Mingled with air in the right proportion for combustion, the mixture of air and vapor was heated by thermo-dynamic action of compression, approximately adiabatic up to the temperature of ignition, and the explosion followed. This action is precisely that relied upon in the Diesel gas engine, recently attracting so much attention, for the ignition of its charge independently of gas torch or electric spark. The phenomenon has long been known to the engineering profession, although instances of this kind of accident are rare. The use of effective methods of cooling the compressor cylinder and the employment of lubricating oils of high flashing point constitute the preventives.

Steel Head Gear at Cripple Creek, Colo.



Steel Head Gear, Elkton Mine, Cripple Creek, Colo.

The second steel gallows-frame to be put up in Cripple Creek district has just been completed at the Elkton mine. It was furnished through the Hendrie & Bolthoff Manufacturing & Supply Co. of Denver. The frame stands 55 feet from the collar of the shaft to the sheaves. The upright pieces are of lighter weight than is usually seen; but the back braces, extending from the sheaves toward the hoisting engine, are unusually heavy, as in them greater strength it required. These and the side braces, as well as the uprights, are anchored in solid piers of rock and concrete. The two sheaves are each 6 feet diameter, grooved for flat cable rope. The hoisting engine, a first-motion duplex, which has already been described, is ready for business. Two double-decked cages will be operated in the three-compartment, 800-foot shaft, the cage guides being 4x6 inches in size. In this shaft was performed the difficult work of cutting out a third compartment from the 400-foot level to the surface after the shaft had been made three compartment from the 400 to the 800-foot level. Supt. Camps expresses satisfaction at being through with the job. The next improvement at this shaft will be to put in electric bell and station signals.

The waste is taken out on the lower floor, while all cars of ore are delivered at the top floor, 25 feet above the collar of the shaft, and taken thence to the ore bins. The latter are eight in number, each 12x30 feet in size. The ore building, 30x100 feet, is supported by a heavy retaining wall, and it is believed it will not settle. The ore bins and chutes are all steel-lined. In dumping the ore at the top floor it falls upon heavy grizzlies, below each of which is a coarse screen, by means of which the ore is partially graded.

The Elkton, Tornado, Raven and Thompson, all the property of the Elkton Con. M. Co., will from now on hoist about 1200 to 1400 tons per month.

Elkton, Dec. 1. WASCOTT.

Some Diamond Figures.

Not every one has the facilities for measuring and weighing a cubic foot—or even a cubic inch—of diamonds. The figures given below, which were furnished by an official of the De Beers Consolidated Co., will have much curious interest. The first measurement taken was of diamonds sufficient to fill a space of 75 cubic inches, the time being July of the present year. The diamonds were what a coal operator would call "run-of-mine"—that is, they were of all sizes, mixed together just as received from the works where they were separated from the blue ground matrix, but had been cleared by boiling in acid. Three measurements were made, the first giving 14,617 carats, the second 14,666 carats, and the third 14,860 carats, the average being 14,713 carats.

According to these measurements 1,000,000 carats of diamonds of average size would make:

	Cu. inches.	Cu. feet.	Cu. meters.
First............	5,131	2.97	0.0841
Second..........	5,114	2.96	0.0838
Third............	5,045	2.96	0.0827
Average......	5,097	2.96	0.0835

Conversely, taking the average, a cubic foot of diamonds would weigh 336,700 carats, and a cubic meter 11,976,000 carats. Assuming them to run about the De Beers average, a cubic foot would be worth about $2,215,500 and a cubic meter $78,802,000.

During the eleven years ending June 30, 1899, the mines of the De Beers Co. produced, in round figures, 25,098,000 loads of "blue ground"—the diamond-yielding ground—averaging 16 cubic feet each. This is equivalent to 18,851,000 metric tons. The diamonds saved from the blue ground were 24,476,000 carats, including all sizes, and the amount realized for the stones was $161,152,303. This is an average return of $6.58 per carat. The average recovery was 1.3 carats per metric ton, and the average yield was $8.55 per ton of blue ground.

The blue ground extracted during the eleven years would make a cube with sides 740 feet or 226 meters long, while the diamonds recovered would be represented by a cube with sides 50 inches, or 1.27 meters, long. The ratio in size of the diamond cube to the blue ground from which it was taken would be about 1:178 in the length of one side of the cubes, or 1:6,000,000 in total bulk.

Uses of Vanadium.

Vanadium is used in the manufacture of aniline black, which is formed when vanadic acid or a vanadate is heated with aniline chloride, with reduction to $V_2 O_4$. The latter oxide may again be made active by oxidation with potassium chlorate, so that the reaction may be often repeated without any fresh addition of vanadium. This method is useful for staining wood black, as well as in producing an indelible black writing ink. When applied to pottery and fired at a high red heat, the oxides give a fine gold color with a greenish tinge.

Alloys of vanadium and other metals have been obtained in considerable variety by first using aluminum. A cast bar of 1% vanadium had a tensile strength of 11 tons, an elongation of 7%; aluminum bronze, with 8 parts aluminum and 1 part vanadium, gave 45 tons tensile strength and 12½% elongation.

Ordinary malleable iron of about 24½ tons tenacity and 19% elongation was changed by the addition of .5% vanadium to 39 tons and 12% elongation in the forged bar and 33.7 tons and 32% elongation annealed. This has called attention to the remarkable malleability and ductility of the alloy. A mild steel of 30 tons tenacity and 17% elongation, with 1% vanadium, gave 61 tons tenacity and 14% elongation, and, when annealed, 45 tons and 20%; and, although very soft when annealed, these alloys become very hard by tempering.

At present there are no steel manufacturers using the oxide in quantity, as the demand for vanadic acid as a mordant in dyeing takes the entire supply from the slags of the Creusot Steel Works in France—165,000 pounds per annum. A large supply should admit of the use of vanadium in the manufacture of steel for armor plate, forgings for ordnance and naval machinery, projectiles, tools, rolls, calendars, etc., and various bronzes.

MINING SUMMARY.

ALASKA.

At the Sea Level, at Ketchikan, Supt. E. C. Morse, 24-inch steel water pipe will be laid from Gokatcheen Falls to the line for power purposes. A new compressor, drills, hoist, and a 30-stamp mill (with equipments for another ten stamps), will go in also.

A find of rich placers is reported made in Cook Inlet district. Operations are closed down for the winter.

ARIZONA.

COCHISE COUNTY.

Good ore is reported opened up on the property of I. B. Stone in the Dragoons. ——It is expected that shipments of ore from the Copper Crown to El Paso will soon be made.——The Val Verde C. M. Co., Ltd., of Val Verde has applied for patent to 82.5 acres of land near there. ——At Pearce the new Mammoth stamp mill is about ready to start up. A new double-compartment shaft is being sunk to below water level and pumping machinery will be put in.——The 7x5-foot tunnel on the Dos Cabezos (copper), 12 miles southeast of Willcox, is in 140 feet. A 10-foot body of 25% ore was opened up recently. A lower tunnel is run on the 275-foot level.

GILA COUNTY.

It is reported that the London Globe Exploration Co. may bond the Lawrence & Glissau property and other claims near Dripping Springs. A strike was recently made on the Lawrence & Glissau.

GRAHAM COUNTY.

The Medler M. Co. is putting in a 100-ton concentrating plant and a 50-ton smelter 3 miles below Clifton. The concentrator will treat the company's ores, but the smelter will also be open for custom work.——Oil is reported found at a depth of 690 feet on property near Cienega, 8 miles south of Safford.

MARICOPA COUNTY.

A ledge of wolframite is reported found near New River, north of Phœnix.

MOJAVE COUNTY.

The Bonanza King, at Providence mountain, is reported sold to a Philadelphia company for $25,000. Work will be pushed by the new owners.——A road to Hackberry from the Grand Gulch copper mines will be built.——H. O. Mackay will begin operations on the C. O. D. at Kingman.——Bohne & Kempf are shipping ore from the Mint.——The shaft on the Gold Road is down 65 feet.——Russell & Ziemer have men working on the Man, Todd basin.——It is thought that a matte furnace will be put in on the Oro Plata.——J. Uncapher is working the Queen Bee at Mineral Park.——Supt. Hastings of the Ramrod group, at Klondike, has sunk the shaft 300 feet.

PIMA COUNTY.

The Liberty, Tucson, is shipping ore to El Paso; Supt. Wemple.——The Milwaukee & Arizona M. Co., the Chief M. & D. Co. and the Casa Grande M. Co., Quijotoa, are pushing work on their properties near there.

PINAL COUNTY.

The St. Louis Gold Recovery Co. at Mammoth has resumed operations.——The new shaft on the Sunset group, in Casa Grande district, near Florence, is down 100 feet. A good body of iron ore is opened up at this depth. Sinking will be continued, as there are indications of copper ore underlying the iron.——Bley & Adams are driving a tunnel on their claim near Riverside to cut the ledge at a depth of 100 feet.——Supt. H. Parry is pushing work on the crosscut from the bottom of the shaft on the Iron Duke of the Milwaukee & Arizona P. & M. Co. at Mineral Creek. The shaft is down 110 feet and the crosscut is in 166 feet. He is also pushing work on the company's lead property near Casa Grande. A carload of ore was recently shipped to El Paso. It is said that he will recommend the erection of a lead smelter on the property.——Development (sinking, drifting, etc.) on the Shannon, Florence, is progressing at the rate of 100 feet per month.——J. W. Osborne is developing claims in the Castle Creek district.

YAVAPAI COUNTY.

The White Horse group, near Walker, is reported sold to Hayes & McBride of New York for $25,000.——Near Huron the Mineral Copper Hill Copper Co. of Glasgow, Scotland, Manager Comstock, is pushing work on a group of claims (copper and gold). The ore runs from $2 to $100 per ton; W. Bashford Supt.——The deepest workings on the United Verde copper mines, Jerome, are 700 feet. A depth of 2000 feet was recently attained with a diamond drill, and the bore showed a continuation of the ore body to that depth.

CALIFORNIA.

AMADOR COUNTY.

Work on the Keystone, Amador City, is being pushed.

At the Mutual, Sutter Creek, drifting on the west crosscut is in progress.——It is said that the Ivanhoe, Plymouth, will resume under new management.——The new machinery is in on the Kirkwood, near Jackson, and operations will begin soon. ——The Keystone has been in active operation nearly half a century.

BUTTE COUNTY.

(Special Correspondence).—The new 15-stamp mill on Bloomer hill, erected by Wm. Stephens of Redding under contract with the Joshua Hendy Machine Works, was started up on the 1st. It is calculated to crush five tons to the stamp. The power is water under 700-foot head. An 18-inch motor placed on top of ore bin will drive the rock breaker, the water from it to be carried into a tank and used for batteries. A 7-foot Pelton wheel will drive the batteries. In the water wheel, line shaft and pulleys provision is made to drive forty stamps. The mortar blocks, mud and line sills are in place for ten additional stamps, which, when completed, will make twenty-five in all. Adjoining the mill on the south is a new 3-drill compressor and a 6-foot water wheel to drive it.

Bloomer Hill, Berry Creek P. O., Dec. 3.

CALAVERAS COUNTY.

The Eudora, Mokelumne Hill, is reported sold to W. A. Graves, of San Francisco.——Ore from the winze in upper tunnel of the Riverside, at depth of 24 feet, is said to assay $200 per ton.——L. C. Clark, of San Francisco, has bonded the Deep Gulch (quartz), in Chili gulch, for two years for $3000, it is said.

A strike is reported made at a depth of 40 feet on Central hill, near San Andreas. ——On the Lloyd (gravel), on Central hill, bonded to Mr. Palmer of Oakland, a 210-foot shaft is sunk. Twelve men are working on eight-hour shifts. A new pump is in and working successfully.——Manager Hussey is pushing work on the Lucky Boy, on Deep creek, near Valley Springs. ——Supt. A. Pugh of the Farrington G. M. Co. is pushing work on the Lone Star. ——The bond on the Defender, at Camp Contreras, is surrendered, the bondees being unable to fulfill requirements. F. B. Joyce, owner, will operate the mine.——The Sheep Ranch will use electric power from the Utica plant.——Seventeen men are employed at the Oriole, near Angels. A good body of ore is reported opened up up on the 1600-foot level.——At the Ozark, in Quartz gulch, near Murphy, drifting east and west is in progress; Supt. G. Scantlebury.

Work on the Emerson, near Mokelumne Hill, is begun. Water pipes are in and water is being pumped.——C. Weatherwax, Supt. Sunrise, is putting in a new steam hoist; good ore is opened up in bottom of shaft.——Work is progressing at the Last Chance.——The Paragon will resume.

The Lloyd, on Central Hill, near San Andreas, is temporarily closed down, owing to a heavy flow of water which was tapped recently. Pumps of larger capacity will be put in and work resumed.——W. W. Cook of Mokelumne Hill has bonded the Petticoat, near Railroad Flat, and will begin development work.

At Albany Flat ore yielding $14 to the ton is opened up on the Tulloch.——The mill at the Sheep Ranch is temporarily shut down while electric light plant is being put in. Shaft will be repaired and other improvements made.——The tunnel on the Hexter, near Mokelumne Hill, now in 1400 feet, will be driven to the 2000-foot mark.

EL DORADO COUNTY.

The French M. Co. is putting in a big dam at Long canyon for hydraulicking this winter.——The Gopher-Boulder at Kelsey has resumed operations.——Work on the Alpine, Georgetown, is being pushed.——Hughes, Davey & Simpson have bonded the Maggini, an extension of the Hart Consolidated, and will push work.——The Carey M. & M. Co., of Oakland, capital $100,000, is incorporated to work the Carey group near Josephine.——The new pipe for the Hart Consolidated is going in. They will have a head of 400 feet to drive the Huntington mill.

GLENN COUNTY.

The Glenn County Oil & Coal Co., Fruto, is putting in machinery, supplies, etc. Work will be pushed during the winter. The Great Northern Oil Co., Elk Creek, is putting in boring machinery.

KERN COUNTY.

The Golden Gate, Bakersfield, is putting in a rig on 2, 11–24.——The Imperial Oil Co. has ten wells on 33, 28–28, each said to produce 150 barrels of oil per day. ——The Clarke Co., drilling on the southeast quarter of 20, 28–28, has finished its well at 910 feet.

A strike was recently made on the Orphan Boy, in Stringer district, near Randsburg.

LOS ANGELES COUNTY.

The Columbia M. & M. Co. has incorporated in Los Angeles; capital stock $100,000; R. J. Dyas, P. B. McCabe, W. Boeck, C. F. Karns, D. P. McLeod.

MARIPOSA COUNTY.

The annual meeting of the stockholders of the Columbus Con. G. M. Co. of Mariposa will be held in San Francisco on the 10th inst.

MONTEREY COUNTY.

(Special Correspondence).—New placer diggings have been found on the headwaters of Wilson creek. The gold is coarse. A new find has been made near the Lion's Den of coarse placer gold. Gillis & Co., on Spruce creek, the last day they worked took out one nugget weighing thirty-two ounces avoirdupois, together with several smaller ones weighing three ounces, the whole weighing three pounds. The Plasketts, working on the same creek, exhibit pieces weighing from $5 to $10. F. Melville is ground sluicing one of his claims at the head of Spruce creek. He has taken out nuggets from $5 to $12.

Los Burros, Dec. 1.

MONO COUNTY.

The mill of the Goleta Co., at Jordan, is closed down for the winter. Supt. Nelson will push mine work during the winter. ——At the Castle Peak the boiler and air compressor are in, and hoist is going up; piping is being laid.

NAPA COUNTY.

The Mt. Shasta Oil Co. is pushing work on its property in Berryessa valley.

NEVADA COUNTY.

The Empire mill, Grass Valley, is undergoing extensive repairs. New mortars, framework, iron work, concentrators, etc., are going in. A new hydraulic pump will also be put in. It is thought that it will take two months to make the improvements. Forty men are temporarily laid off. Twenty stamps will run while repairs are being made. The new mill will be run by water power, and pipe is now going in to connect mill with the Yuba Co.'s water supply.

PLACER COUNTY.

The Boston–South Dakota M. Co. is handling 25 cubic yards of gravel daily, which averages $5.25 per yard; the product will be increased. The cost of handling it, with the improved machinery now being installed, will be reduced to $1.25 per cubic yard. The mine is being equipped with electrical machinery. The company's agent estimates that there are 900,000 yards of gravel in the Weske channel alone, or enough to supply 250 to 300 yards daily for more than ten years.

The River M. Co., operating the Pleasant Bar, American Bar and Willow Bar placers, on Middle Fork of the American river between Michigan Bluff and Forest City, has leased the Horseshoe Bar property, including ditch and water right of 800 inches under 400 feet pressure, hydraulic elevator, pumps, giants, etc., for five years. The tunnel at Horseshoe Bar is paved with 100 feet of rock and 50 feet of T rails.—At the Dewey Consolidated (gravel), at Iowa Hill, piping is under way; 800 inches water are available.—— At Deadwood, twelve men are employed at the Basin Con. Drift. Average width of channel is 60 feet; main working tunnel is in over 4000 feet. J. C. Whitney, owner; J. W. Dunlap, Supt.

Mr. Patterson will resume operations on the Patterson (gravel) in Badger ravine, near Loomis.——On the Bellevue, the shaft is down 70 feet.

In the Morning Star, at Iowa Hill, portions of the mine may be leased.——Supt. J. Sullivan is pushing work on the Pioneer and expects to have the mill running soon.——Dorer Bros. are running their 10-stamp mill, one shift at present, but will run it steadily as soon as development permits.——Olson & Co. have contract to drive a tunnel on the Southern Cross.——The old Bob Lewis (gravel), at Damascus, will be reopened, it is said, with G. W. Snyder as Supt. A 2000-foot tunnel will probably be run to strike the channel.

A strike is reported made on the Bellevue, near Ophir. Drifting is in progress on the 210-foot level. The ledge is said to be from 18 to 20 inches wide, and that the ore assays $1000 to the ton.

SAN BERNARDINO COUNTY.

A strike of $15 ore is reported 12 miles from Twenty-Nine Palms.

SHASTA COUNTY.

A deposit of bitumen is reported found near Redding.

The Mountain Copper Co. pays the county an annual tax of $45,000.

Shares in the Trinity Copper Co. sell in New York City at $25. The company is capitalized at 240,000 shares. T. W. Lawson of Boston is president of the company and at present owns most of the shares.

The Three Sisters, on Kline gulch, near French Gulch, is bonded to M. Stourfer of Nebraska, Vinege & Hammond of Chicago and T. Motherwell of French Gulch for $10,000. Work will begin on Feb. 1st, it is said.

SIERRA COUNTY.

All materials, etc., for the new stamp mill at the Frost, near Downieville, are on the ground and construction will be pushed.——Another strike is reported made on the Osceola, at Alleghany.

SISKIYOU COUNTY.

Milne & Hassick have leased the Old Vet in Humbug district, near Yreka. A recent twenty-ton shipment returned $20 per ton.——Morton & Shurtleff are pushing work on the North Star.——Manager T. Hegler is pushing work on the Nelson group.——Stoping will soon begin in the upper level of the Craggy.——The hoisting plant at the Black Bluff, in Fool's Paradise district, is in, and operations will soon begin.——The Gold Ball, in Salmon River district, is reported to be producing $600 per day. Ore runs about $60 to the ton. Supt. Ball has sixty-two men working,——Behnke & Welker have put in a water-power arrastra on the Snow Flake, in Eddy's gulch, near the Gold Ball.——In the Olympia the tunnel is in 64 feet; near the end of latter a 25-foot winze is sunk.——Work will soon begin on the Black Bear under new management. A 500-foot shaft will be sunk.——Work on the Van Brunt, in Happy Camp district, is resumed. Two giants are working. Supt. Miller has twenty men working.——Kingsbury & Cuddihy have leased the Minnetta B. (hydraulic) and hydraulicking will soon begin.——B. Hamilton is putting the Siskiyou in shape for a run. ——Woods Bros. will soon begin operations on the Mason Bar.——Gordon & Sons will begin operations on the Gordon soon.——The Lightman, in Cecilville district, is equipped with a No. 2 giant, having a 5-inch nozzle. Water volume is given as 500 miners' inches.——Work on the Giles is being pushed.——The King Solomon closed down for the season on Nov. 16th; Supt. Fletcher.——H. Bowerman will push work on the Wild Irishman, Cecilville, during the winter.——West Bros. will put in pipe and a giant on the Cody Bar.——The Big Bear M. Co., at Orleans Bar, on the Klamath river, has ten men employed and a No. 3 giant at work. They expect to hydraulic the year round. The property consists of 1200 acres.——An assessment (No. 7) of ¼ cent per share is levied by the Golden Star M. Co. on Humbug creek, near Yreka, delinquent Jan. 2, 1901.

Twelve tons ore from the McKinley, on Sutter Creek, in Humbug district, yielded $50 per ton. Perkins & Marlin, owners. ——On the Greenhorn No. 2 (gravel), near Callahan, the shaft is about cleared of water, and drifting will be started.——Russell Bros., of Oakland, have tapped the extension of the Sheba, on Patterson Creek, by running a tunnel through the hill. A ledge of low grade ore, over 12 feet thick, was opened up.——The Little Humbug will start up when sufficient water is obtained.

TRINITY COUNTY.

The new 10-stamp mill on the Brown Bear, Deadwood, is completed.

TUOLUMNE COUNTY.

Unwatering of the Norwegian, Sonora, is in progress.——The Longfellow cyanide plant is running steadily.——Sinking and drifting are being pushed on the Densmore. A larger mill will go in.——The Grand View G. M. Co., capital $250,000, is incorporated and will work a gravel claim near Montezuma.——Work on the tunnel in the Philadelphia Diggings (gravel), at American Camp is progressing. A restraining dam is built, and the 15 miles of ditches are in good shape. Water will be brought from South Fork of the Stanislaus river, 4 miles below Strawberry, and from Rose creek.——On the Over, on Bald Mountain, the tunnel, now in 250 feet, will be driven an additional 700 feet. ——Twenty stamps are dropping at the Dead Horse, near Carters. Supt. Kane is pushing work in the mine also.——A strike is reported made in the Golden West, near Jamestown. A 10-stamp mill is going in, and a double-compartment shaft will be sunk to 1000-foot level.

A strike is reported made on the Tri-Color at Tuttletown.——On the Hopeton, Sonora, the shaft is down 140 feet. The vein is 12 inches wide.——May & Son are drifting at the 70-foot level on property off Baretta street, Sonora.

The Goldwin M. Co. will put in a 10-stamp mill near Jamestown.

COLORADO.

DOLORES COUNTY.

The average cost of drifting, including timbering in and around Rico, is said not to exceed $4 per foot.——The mill of the Colorado M. & C. Co. is running steadily. ——The electric power drills driving the Pro Patria tunnel on Dolores mountain are working successfully. Progress is at the rate of from 4 to 6 feet per day.——A new gasoline engine for running the blower at the Smuggler-Alta group, Rico, is placed.——The Mt. Gorman M. Co. project 1000 feet of development work on the Mt. Gorman group this winter.——The Emma mill, Dunton, is closed down for the winter.

EL PASO COUNTY.

A. C. Adams and associates are reported to have made a strike of 20-ounce ore on block 44 of the Anaconda, Anaconda, recently.

FREMONT COUNTY.

The flues and smokestack for the Rocky Mountain smelter, Florence, are in. Twenty ore bins, 12x14 feet, are going in; automatic conveyors will take ore to the latter. The new 500 H. P. compound Corliss engine is in place and connections with boilers and line shaft are made.——The Florence Oil Co. has five rigs up near Florence and drilling is progressing.——The United Oil Co. has put up a power plant which is operating fourteen wells.——The new mill of the Union Gold Extraction Co. at Florence will be finished Dec. 20th. All departments, with the exception of the finishing rolls and driers, which will be run by steam, will be operated by electric motors. Power will be furnished by a 500-volt Westinghouse multipolar direct current 310 H. P. generator, driven by a 500 H. P. engine, with flywheel 18 feet in diameter, and weighing 36,000 pounds.

GILPIN COUNTY.

The Unexpected, in Lake gulch, Central City, is reported bonded to Boston men. Machinery formerly on the Moyle, on Swede hill, near Black Hawk, is going in on the property. A new shaft house, 30x50 feet, will be erected; S. Hoskin Supt.——The Minnesota is shipping ore to the Rocky Mountain smelter at Black Hawk. On the 300-foot level drifting and stoping are in progress, and a winze is being sunk from the 400-foot level to cut the ore body. Central Development Co. operators.——Night and day shifts are working on the Ophir-Burroughs, on Quartz hill. The shaft is down 1300 feet. Daily shipments of ore are made. Fifty men are employed; A. Waters manager.——The West Notaway is shipping ore to the mills at Idaho Springs.——The new hoisting machinery at the Carr, operated by the Carr M. & Colo. Co., Ltd., is in and working successfully. The new rope is 1600 feet long and ⅞ inch thick. New additions for blacksmith shop and coal sheds are up and the work of straightening and cutting down the shaft is in progress. The shaft, now down 500 feet, will be continued several hundred feet farther.——The Carcasonne M. Co. will put in a gasoline hoisting plant on the Carcasonne. The shaft, now down 175 feet, will be sunk to the 200-foot level. Two shifts are working.——The Imperial M. Co. is cutting a pump station at the fifth level of the First Centennial, in Chase gulch. When completed sinking will be continued 100 feet, and probably 200 feet. The shaft has been retimbered and drifting on the fourth and fifth levels is in progress.——A strike of good smelting ore, carrying copper, iron and lead, was recently made on the West Calhoun, in Leavenworth gulch, near Central City, by the Gold Investment M. Co.

GUNNISON COUNTY.

A long drainage and transportation tunnel is projected by M. A. Hanna and others to run from the head of Tomichi creek and cut the May Mazeppa, North Star, Eureka Nest Egg and other silver-lead properties at Lake hill, near White Pine. The tunnel will be a little over a mile long, and work will be begun next spring. The smelter at White Pine will be put in shape to treat ore as it is opened up.

HUERFANO COUNTY.

New machinery is going in at the Walsen coal mines, near Walsenburg.——The Robinson is shipping coal.——At Santa Clara Supt. Breen is shipping thirty-five cars of coal per day.

LAKE COUNTY.

At the Greenback, Graham Park, Leadville, three additional 125 H. P. boilers are in, and plant now has 555 H. P. A "6" steam line and a "10" water column are in and two No. 3 B sinkers are throwing 800 gallons water to 800-foot level, from which it is conducted to the Emmet, and from the latter to the surface.——A shaft-house is going in on the Congress on Poverty Flat.——The meeting of the Big Six M. Co., which was to have taken place on Nov. 15th, was postponed until Jan. 15th.——On the Ohio, on Breece hill, the shaft is down 200 feet; levels are run at 65, 150 and 200 feet. Ore from the latter runs about $6 per ton.——Ore bins and an elevated track are in at the Moyer.——The shaft on the Valentine, Leadville, is down 500 feet. The Benton M. Co. is sinking another shaft southwest of No. 1 shaft on the Breece.——On the Highland Chief the shaft, now down 100 feet, will go an additional 400 feet.

A new plant is going in on the Black Prince No. 2, on Breece hill, Leadville, operated by Lessee Rodgers. The shaft, now down 250 feet, will be sunk an additional 100 feet. Good ore is opened up.——Work on the Spot Cash will be continued through the winter. The shaft is down nearly 700 feet. At this level drifting will begin.——Carnahan & Gaw, leasing the President, are pushing work on that property with good results.——During the past ten months considerable development work has been done on the Ballard, on Breece hill. At the 422-foot level drifts have been run in four directions, all of them in ore. From the 360-foot level upraises have been run, showing ore up 90 feet. Shipments now average 1000 tons per month.——Operations on the Chrysolite, on Fryer hill, Leadville, will probably be resumed soon.

SAGUACHE COUNTY.

The Eureka Exploration Co., capital $400,000, is incorporated to work property near Crestone.——Coleman & Quinn have men blocking out ore, etc., on their properties near Crestone.——The big mill at the Independent is running. By Jan. 1st it is thought that 200 men will be employed in and around the mill; sixty men are now employed.

SAN JUAN COUNTY.

H. Moore and associates will put in an electric drill on their group of claims in Cascade basin. Electric power will be obtained from the Telluride Power Transmission Co.'s line, which will be run to the mines. Work on the group will be pushed next year.——It is said that the shut down of the Japan will probably be of long duration, as development and repair work will be done that will require nearly two years to finish.

SAN MIGUEL COUNTY.

The Peck cyanide plant at Telluride is closed down for the winter. At time of closing down it was treating 200 tons tailings daily.——Work on the Nellie is progressing. Elliott & Morrison will enlarge their concentrating plant, now 10 stamps, to 15 stamps. The plant is running on ore from a dump on the Sheridan, a Smuggler-Union property.——Shane, Treais & Smith are driving a tunnel on the Fairview; it is in 75 feet. A mill run of 20 tons is being taken out, and it is thought that it will return $30 per ton. Work will be pushed during the winter.——Manager S. D. Sayer is pushing work on the Butterfly.——In Bridal Veil basin, E. L. Sleeper is running a tunnel on the Hacienda group. Work will be continued through the winter.

SUMMIT COUNTY.

The North American Gold Dredging Co., operating the Swan and Blue river placers, will be reorganized and work pushed.

TELLER COUNTY.

(Special Correspondence).—The Arno G. M. Co., of which John Sharpe is president and manager, Sol Camp vice-president, E. W. Sebben secretary and treasurer, was organized to operate on a group of about ten acres of mineral ground underlying the town of Anaconda, Cripple Creek district. In the title by which the lots of this town were transferred to lot owners the mineral rights were not reserved. Within the last few months Mr. Sebben, promoter of the Arno Co., quietly purchased the mineral rights from the numerous lot owners, securing surface title as well to eight lots in one locality, with the result that the portion of the mineral ground lying between the Anaconda and Mary McKinney groups is grouped in one compact ownership, a twenty-year lease from the town having been secured for the mineral rights under the streets and alleys. A steam hoist has been installed on the surface holding of the company and an 85-foot shaft sunk, from the bottom of which a crosscut is being run toward the Anaconda, by which it is expected to open one or two well-known leads. The project is attracting much favorable attention. WASCOTT.

Cripple Creek, Nov. 26.

(Special Correspondence).—The Work is a large group of mines mostly on Raven and partly on Gold hill. The Work Co. is conducting operations on the major portion of the Poorman claim, the rest of the group being in the hands of lessees. Besides the lease of the Woods Investment Co. on the Morning Glory shaft and contiguous ground, there are six other leases, including the May Queen, Poorman, Pelland, Whitford, Regan and Carlson, the total tonnage from all amounting to considerable, the grade of ore being unusually high. The Woods Co. spent nearly $100,000 for equipment and improvements on their lease, the shaft through which they work being 700 feet deep, with crosscuts to the Jack Pot vein at the 550 and 700-foot levels. Other lessees have also spent money freely for improvements. All the leases referred to expire Sept. 15, 1902, thus giving the lessees nearly two years yet to operate. At the expiration of that time the company expects to assume charge of operations. The group carries several distinct veins; there being four veins on the Pelland lease and five on the Whitford. The ore generally has run from one ounce to twenty-five ounces, the maximum value of shipments made, however, being 158 ounces gold and 94 ounces silver per ton. From one of the Gold hill shafts a connection is being made with the Ophelia tunnel, which at that point cuts Work ground 435 feet below the surface. WASCOTT.

Anaconda, Nov. 28.

(Special Correspondence).—The 800-foot, three-compartment shaft No. 2 of the Portland mine has been equipped with a wood gallows-frame, the corner timbers forming a 16x9-foot rectangle, rising 60 feet above the shaft collar. The back braces, which extend from the top toward the hoisting engine, are double, made of 10x14-inch pieces, the upright pieces being 14x14 inches. This construction has been in charge of J. W. Wade, who has directed most of the timbering in the Portland mine within the past two or three years.

At this same shaft No. 2 a new first motion hoist has been installed, as well as a battery of water tube boilers of 1000 H. P. capacity. The installation of a forty-drill compressor for No. 2 is also planned.

Victor, Nov. 24.

Sinking of Climax No. 2, Victor, shaft is suspended at 330-foot level and drifting is in progress at that depth.——Delaney Bros. have placed a gallows-frame over an 80-foot hole, west of the Santa Rita, and will begin sinking as soon as engine and hoist are put in. Work in the tunnel is abandoned, but sinking and crosscutting are progressing.——The Santa Rita shaft, now down 580 feet, will be sunk to the 610-foot level, where drifting north and south will begin. A new hoist may be put in this winter. A new office building is completed; Manager, Conant.——The tunnel on the Climax No. 1 is in 700 feet.——The Gold Bond M. Co. will sink a new 300-foot shaft.——Ross & Hummer, leasing a block of the Gold Bond, will run a second level at a depth of 127 feet.——The Eclipse Con. Co. will soon make a shipment of ore from the 350-foot level.——The German-American G. M. Co., owning the Puzzle, on Gold hill, will develop that property through the Gold Exploration tunnel. Drifting was begun at a point 900 feet from the mouth of bore.

Operations on the Doctor, Cripple Creek, are resumed. The shaft is down 900 feet.——The Ironclad is shipping ore running about two ounces to the ton.——The old shaft-house at the Jewel is being torn down. It is said the property will be worked through a single shaft along with adjoining property on Poverty gulch.——The Elsmere Milling & Land Co., leasing block 14 of the Cameron, Cameron townsite, have opened up a 3-foot vein of $25 ore at the 24-foot level. The shaft will be sunk an additional 50 feet. Ore bins are going in.——A station is being cut on the 800-foot level of the Legal Tender on Bull hill, and sinking is suspended temporarily.——The Isabella is shipping ore.——Drifting is in progress on the 550-foot level of the Marie, and ore is being shipped.——The Victor recently made a shipment of nine carloads of ore. The production runs about 100 tons per day.——F. G. Clark is working the Kitty M. through the Anaconda tunnel.——To Nov. 1st the total gold output of Cripple Creek is given as $104,917,586; October output was $1,956,000.——A strike is reported made on the third level of the Wrockloff lease on the Burns, Victor.——On the Pinto the crosscut driven northwest on the 625-foot level cut the vein 120 feet from the shaft. A third shift will be put on.——J. A. Fitting, bonding the Bertha B., on Raven hill, is crosscutting east through a phonolytic dyke on the 200-foot level to cut the Moose vein.

Supt. Hills of the Sacramento has discontinued drifting on the 250-foot level and is now stoping. Ore runs from $50 to $500 to the ton. Shipments average one carload per week. On the Midnight claim of the Sacramento drifting and crosscutting are in progress.——McCormick and others, leasing block 4 of the Eclipse, on Battle mountain, are drifting north on the 70-foot level.——On the Last Dollar a new lift is completed and the shaft is down 900 feet.——The new 40x60-foot shaft-house at the Rubie is completed and the two new 100 H. P. boilers and ten-drill compressor will be in inside of two months. Shaft is now down 950 feet and will be sunk an additional 400 feet. A new hoist will probably be put in, as the present one is capable of lifting only 1050 feet.——Supt. Fitting will put the new engine on the Lafayette dump, 20 feet above the present location.

The Colorado Ore Reduction Co., with plant at Arequa, will suspend operations, as it has been found impossible to run the plant at a profit. Most of the contracts now in hand will be turned over to the Union Co. at Florence, which is practically owned by the same people. By the closing down of this plant, but one reduction mill—the Economic—will be left in the Cripple Creek district.——A strike of high-grade ore is reported from the Theresa, Goldfield. The shaft is down 500 feet.——Bodewin & Co. are taking out good ore from the 100-foot level of the Trenton on Gold Hill, Cripple Creek. Assays run from $40 to $200 per ton.——T. Bradford, manager Bankers Leasing Co., operating the Morning Star, is shipping ore.——Ore from the Morning Glory of the Woods Investment Co. assays from 5¼ ounces to 8½ ounces gold per ton, obtained from the screenings, while 1¼ ounces are obtained from the coarse rock.——Shove, Aldrich & Co. have secured control of the Little Bessie Co., owning eight acres on Beacon Hill, and will push development.——E. S. Gibbs has leased the J. J. L. on Beacon Hill for one year.——Murray & Swift have opened up $10 ore on 100-foot level of the Maggie, on Gold Hill.

IDAHO.

ADA COUNTY.

Fifty-dollar ore is reported opened up on the Black Hornet, in Black Hornet district.

BLAINE COUNTY.

The new 20-stamp mill for the Hattie group, Hailey, Supt. Black, is expected to be on the ground Jan. 1st.——Operations on the Golden Star are delayed, owing to lack of lumber, coal and wood.

The Hailey Times reports the sale of the McFadden group, near there, for $100,000.

A strike of copyritic ore is reported on 400-foot level of the Tip Top, near Hailey; another strike of same kind of ore is reported from 300-foot level of the Golden Star, ½ mile west from the Tip Top; ore in both cases is said to run $100 gold and 30% copper per ton.

BOISE COUNTY.

Mr. Grayson will resume operations on the Gold Hill, Quartzburg, next spring. Eastman & Hall are developing property near Horseshoe Bend.

Operations on the Little Sammie, near Idaho City, will be continued through the winter. The mill is temporarily closed down.

ELMORE COUNTY.

The Homestake, Neal, Manager Balbach, is closed down for the winter.——Gary & Enebo will work the Elmore during the winter.

Williams & Miles have contracted to work the Denver, owned by Supt. Williams of the Homestake.

OWYHEE COUNTY.

At Silver City, H. Sullivan is crosscutting in the Steuben.——The Trade Dollar Co. has bonded the Ontario.——The Wagener arrastra is running on ore from the Steuben, and will soon run on thirty tons ore from Jacobs gulch strike.

Eight men are employed at the Poorman, Silver City, under Foreman Gerling. Work on the 350-foot level is being pushed.

Wildernicker Bros., operating the Meadow Bank, on Cow creek, near De Lamar, have sunk a 70-foot shaft and have opened up good ore on that level. They will drive a 600-foot tunnel and put in a track.

SHOSHONE COUNTY.

Work on the Sunset and Kill Buck mines, Wallace, owned by J. K. & W. A. Clark, is progressing favorably. A concentrator will be put in next year on Lake gulch. Water power will be used.

WASHINGTON COUNTY.

The new smelter at Mineral is nearing completion.——A new wagon road is built to the Silver Bell.

F. Pierce, manager Iron Dike (copper) on Snake river, in Seven Devils district, near Bear, states that Receiver Price of the Northwest Copper Co. is expending $2000 per month in development work.

The Peacock is shipping ore to Boston, Mass. Ore is hauled by wagon to Concord, on the Weiser river, 75 miles distant, for $7.50 per ton, and rail freight to Boston is $20 per ton; cost of mining is $4 per ton, making total cost $31.50 per ton.

Three railroads are projected into the Seven Devils district—one from Baker City, Oregon, one from Huntington, Idaho, and another down the Weiser river.

MICHIGAN.

HOUGHTON COUNTY.

Shaft No. 5 on the Tamarack copper vein, begun in 1895, is now close to the conglomerate vein and expects to reach it some time this month, at a distance of 4750 feet from the surface. It will continue down after intersecting the lode and next year will attain the depth of 1 mile. It has five compartments and is 27 feet long and 7 feet 2 inches wide inside the timbers.

MONTANA.

DEER LODGE COUNTY.

Placer gold is said to have been found recently 3 miles from Anaconda.

FERGUS COUNTY.

Two shifts (ten men each) will be employed at the Sapphire mines, Yogo, during the winter.——It is said the owners of the Northern Pacific group, in the Judith range, near Lewistown, recently refused an offer of $75,000 for the group.——The new Kendall mill, in the Moccasins, capacity 100 tons ore per day, is running successfully.

FLATHEAD COUNTY.

The new mill of the American Kootenai M. Co. at Libby is about completed. The terminal stations of the tramway are being enclosed, so that operations can be continued through the winter.——Supt. Beager has men running a working tunnel on the Gold Bug. Ore assays $10 to the ton.

GRANITE COUNTY.

The Lehigh, Sunflower and Blue Bell, on Franklin hill, Phillipsburg, are bonded to Eastern men for $15,000. Men are driving an air tunnel to crosscut the lead.

LEWIS AND CLARKE COUNTY.

J. Breen of Spokane, Wash., has bought a one-third interest in the Monitor, in Monitor gulch, on Ten-Mile creek, near Rimini.——Work on the property of the McClure Co., in Basin gulch, will be pushed during the winter. A 1000-foot tunnel is in and the shaft is down 75 feet. ——The Drum Lummon M. Co., operating the Drum Lummon, near Marysville, has bonded the Jeanette, Redemption, Virginia and Marie lodes, and will push work on same. The 60-stamp mill is being put in shape to run.

MADISON COUNTY.

The Salt Lake M. & D. Co. has relinquished the Old Joe, Pony, after paying $2500. It is said that 238 tons of ore were run through Cowan's mill and that returns were only $5.50 per ton; concentrates, 8 to 1, averaged about $25—$1.50 being saved on plates and from 80 cents to $1.80 being found in tailings.——G. Gade will do 600 feet of work on the Nugget Gulch mine.——G. Brown has bonded placer ground near Sheridan. He will interest Eastern men and work it on a large scale, it is said.——The Centennial-Toledo C., G. & S. M. & M. Co. are sinking on claims near Brandon. Work will be continued through the winter.——The new 20-stamp mill of Glass Bros. at Silver Star is running on Broadway ore.——The Vernia & Vedia will be opened up by Holter, Quail & Hanks. A tunnel will be driven.——The mill that was built some years ago to work the Comet tailings will be in operation soon again. New machinery will be put in and work pushed. ——The Eva May and the Ada are shipping ore.——Drifting is in progress on the 600-foot level of the Kennett, Virginia City.

MEAGHER COUNTY.

The Diamond R. concentrator at Neihart will be enlarged, it is said. Ores from the Moulton and Broadwater mines are treated by this plant.——A custom concentrator for treating gold and silver ores is said to be needed in the Neihart district.

PARK COUNTY.

The Milwaukee-Montana-Natural Bridge G. & C. M. Co., Livingston, is getting out ore ready for the new stamp mill which will be put in next spring.

NEVADA.

ESMERALDA COUNTY.

It is reported that Siegel & Co. will soon begin operations on coal mines near Columbus.

EUREKA COUNTY.

Adams & Johnson are pushing work on the Silver Connor, on Prospect mountain, near Eureka.——M. Moran has leased the El Dorado. It has a 100-foot shaft. Work will be pushed during the winter.——Ten men will be employed on the Bay State, at Newark, during the winter.

Negotiations are pending for the sale of a number of mining properties on Adams Hill, near Eureka.——The Venture Corp., of London, England, has bought the Dambler (copper) for $100,000,——The new compressor and electric motors at the Yellow Jacket are running.

LANDER COUNTY.

The Nevada M. Co., of Salt Lake, will sink a 100-foot shaft on the Nevada, near Galena.

LINCOLN COUNTY.

G. C. Fetterman, of the Magnolia, De Lamar, says there are 1000 tons of $30 ore on the dump at the present time.——It is said that from 7000 to 8000 tons of coal are used monthly in the mines at De Lamar.

The Quartette M. Co. has completed the new 20-stamp mill on the Quartette, at Quartette, 13 miles from Searchlight. Contracts will be let this month for the delivery of eighty tons ore daily at the mill. F. W. Dunn, Manager; Mr. Macready, Supt.; Mr. Wheatley, Foreman.

LYON COUNTY.

A strike of $100 ore is reported made at Como.

STOREY COUNTY.

During the week ending Dec. 2, output of ore at the Con. California & Virginia, Virginia, was sixty-five cars, assaying on a basis of $56.63 gold per ton and 106 cars assaying on a basis of $23.97 gold per ton; 45,450 pounds ore, assaying $62.88 per ton, and 76,850 pounds (railroad weight) ore, assaying $60.52 per ton, were shipped to the Selby Smelting & Lead Co., San Francisco.

In the main shaft of the Ophir repairs are under way. The Sutro tunnel on 1700-foot level is in 223 feet.——On the Mexican the Central tunnel level is in 208 feet.——The west drift on 1600-foot level of the Sierra Nevada is cleaned out and repaired 500 feet.

The Holman tunnel on the Silver Hill is in 690 feet. A connection with the Overland winze is made from the 600-foot point, providing good ventilation for both the Overland and Silver Hill mines.

The new electric machinery going in at the Yellow Jacket, Virginia, is expected to be ready by Jan. 1st. The compressor, a compound tandem machine, driven by 75 H. P. motor, and with capacity of compressing 400 cubic feet air per minute, is running.——At the Caledonia the drift from a point 195 feet in on 1000-foot level is out 63 feet. Face of drift is hard quartz and porphyry. Ore recently shipped ran $17.45 per ton, $11.26 being gold. On the 900-foot level west crosscut No. 1 is in 28 feet.——Seven cars ore have been extracted from the north drift on the 900-foot level of the Overman. Ore ran $20.16 per ton, $12.51 being gold.

It is locally reported that the Ophir Co. may buy the Bowie, on Mount Ophir, near Virginia. Should the deal go through a mill will probably be put in.——Three miles south of the Mendha, $20 ore is opened up at a depth of 675 feet.

WHITE PINE COUNTY.

The 20 H. P. hoisting engine, formerly used at the Bowman, on Adams hill, near Eureka, is being put in on the Pilot Knob group (copper) near Ely.

The Rocco-Homestake-Nevada M. Co.'s statement for quarter ending Sept. 30, given to the county assessor, shows total shipments to have been 780 tons ore, value $32,136; extraction charges were $8700, transportation $15,600, reduction $1900, leaving a net profit of $5936.

NEW MEXICO.

BERNALILLO COUNTY.

C. Yocum will push work on the Maiden Bush, Bland, during the winter.——Work is progressing at the Lone Star. The main drift is driven 400 feet. An upraise is being driven from drift to upper workings.

SANTA FE COUNTY.

The Santa Fe G. & C. M. Co., T. J. McLaughlin manager, has completed the new 200-ton copper smelter at San Pedro: 150 men are employed at mine and mill.——R. Griffith is pushing work on the Cash Entry, near Cerrillos.——The Baird M. Co. has forty-five men erecting a mill near Golden. If water supply is sufficient, capacity of mill will be increased to 300 stamps.——On the Hazleton, of the Argo Milling Co. of Milwaukee, Wis., the shaft is down 320 feet.——A 30-stamp mill is going in on the Black Copper (gold) mines, near Santa Fe. Shaft is down 300 feet, and levels are being run both ways at this depth. Twenty men are employed.——On the Iron placers, in Placer gulch, $1 per cubic yard is extracted.

TAOS COUNTY.

The Rio Hondo Copper Co. contemplates the erection of a 500-ton mill at its mines, near Amizett, next year.

OREGON.

BAKER COUNTY.

It is reported that Snake river will be utilized to generate electric power for dredging purposes on Burnt river, near Huntington.

On the Alamo, near Alamo, the shaft is down 150 feet. A tunnel is being run to cut the ore shoot at a depth of 400 feet. A 10-stamp mill—already contracted for—will go in in the spring; J. G. McGuigan, Pres. and general manager.

GRANT COUNTY.

At Granite the Red Boy has a 20-stamp mill and cyanide plant, the Cougar has a 200-ton roller mill and cyanide plant, the Magnolia has a 10-stamp mill, and the Little Giant has a 20-stamp mill.——Hoisting machinery is going in on the Red Boy and a 2000-foot three-compartment shaft will be sunk.——Work on the Ibex group, 5 miles east of Granite, will be resumed. A 10-stamp mill and concentrating plant will be put in.——The tunnel on the Pyrites, now in 500 feet, will be driven an additional 600 feet.

JOSEPHINE COUNTY.

B. E. Meredith, Supt. Wilson-Meredith hydraulic mine, has completed the suspension bridge for his pipe line over Illinois river. The water supply for the mine comes from the other side of the river, and on account of the rocky channel the pipe could not be sunk to the bottom. The bridge consists of two crucible steel cables, 1¾ inches thick and 475 feet long, giving a clear span of 200 feet over the river. The pipe to be carried is 24 inches in diameter, water rushing through under 210 feet gravity pressure. Its total weight is 80,000 pounds. Mr. Meredith will operate two giants, and expects to have a six months' run. Besides the cable for the bridge there is a ¾-inch cable, with trolley, for passengers.

F. Colvig has resumed operations on his Rocky Gulch placer mine, near Galice. ——The Yellow Horn, Leland, stamp mill will soon start up. Supplies are going in and work will be pushed.

UNION COUNTY.

Supt. F. J. Perkins of the Gem, Sparta, has four men getting things ready for a run.——On the Union group there are 700 feet of tunnels ——Work on the Windsor group may be resumed. A 10-stamp mill is on the property.——Work on the Crystal Palace group will probably be resumed this winter.

SOUTH DAKOTA.

LAWRENCE COUNTY.

P. Kleeman will put in a pump on the Mandaline, near Deadwood, and will work the mine through the winter.——A 100-foot shaft will be sunk on the Monarch (mica). Mica is shipped to Valparaiso, Ind., where the company has a plant.——Drifting will begin on the Mayflower (gold).——It is estimated that there is enough ore in sight to keep the 50-ton cyanide plant on Yellow creek running for three years.

The Crosby-Ehrich Co., of Colorado, has bought 230 acres land near Kirk for $400,000, it is said. A new 1000-foot hoist will be put in and sinking of main shaft begun about Jan. 1st. A mill will probably be put in when development permits. The company will be known as the Belt Extension Co., O. B. Armstrong, manager. ——The American Tin M. Co. will push work on its tin properties in Bear gulch.

TEXAS.

The Mine & Smelter Supply Co., of Mexico and Denver, has acquired the El Paso Mine, Mill & Smelter Co., for $100,000.

UTAH.

BOX ELDER COUNTY.

Good reports are received from the Century at Park valley.

CACHE COUNTY.

The Copper King M. & M. Co. will drive a 3000-foot tunnel on the Copper King and Queen mines in Blacksmith Fork canyon, near Logan. The tunnel will cut main deposit at depth of about 285 feet. Tunnel will be 6x4 feet, and it is estimated that it will cost $2000.

JUAB COUNTY.

Operations on the Cleopatra, Tintic, will resume early in January, it is said.——A strike of high-grade ore is reported made on 525-foot level of the Shoebridge Bonanza, Tintic.——On the 2d inst. fire destroyed the boiler-room and blacksmith shop at the Ajax, Mammoth.

MORGAN COUNTY.

The Carbonate Hill and Carbonate Gem mines, in Cottonwood district, near Peterson, are shipping ore to the smelters at Sandy. The two mines may be consolidated and worked under one management.

SALT LAKE COUNTY.

The Sampson, Bingham, recently shipped 250 tons of ore to the Dewey mill.——The Erie is shipping two cars of ore weekly. —— Supt. Garretson of the St. James group is shipping ore. —— The Rogers mill is treating second-class ore from the Silver Shield.——On the Fortune group the Freedom tunnel is in 500 feet. Two feet of good copper ore were opened up recently.——The Dewey mill will run on second-class ore from the R. J. C. Craze lease on the Neptune. Seventy tons of ore from the Red Wing recently returned 27% lead, 24 ounces silver and $2 gold per ton.——The Northern Light shipments of ore to the Dewey mill are temporarily suspended, owing to bad condition of the roads.——The Bingham C. & G. tramway is delivering over 50 tons of ore to the depot daily. Additional cars have been put on.——The Fortune is shipping 25 tons of concentrates daily; values run from 34% to 37% lead and from 10 to 12 ounces of silver per ton.——Work on the Red Wing, Bingham, is progressing. Ore from the Silver Hill tunnel recently gave $1900 to $2000 per ton.——The Savanic, near Grand Gulch, is shipping high-grade copper ore.——The Bingham C. & G. M. Co., Bingham, will put in a switch to connect mine with the Copper Belt railway. Output at present is between 60 and 70 tons of ore per day.——The Dewey mill, Bingham, is running on Neptune ore.

Ore running twenty-five ounces silver to the ton is reported opened up on the Kansas group, near Bingham.——Manager Packard of the Star Con. recently shipped 110 tons of ore which netted about $30 per ton.——A car of ore recently shipped from the Humbug, J. Knight owner, returned $5000.

The Highland Boy, Bingham, tramway, now being extended to upper terminal at tunnel No. 7, will be ready early in December. The new smelter will be ready by Jan. 1st, when from 400 to 500 tons ore per day will be handled. A shipment of 60,141 pounds pig copper was made to the East on the 24th ult.

It is reported that a Sadtler process smelter, with capacity of from twenty-five to fifty tons per day, will be built for the Horn Silver mines at or near Salt Lake. If built, it will be the first commercial smelter using that process, the only other one being an experimental plant in Denver, Colo.

On the Silver Shield and Toledo claims of the Silver Shield M. & M. Co., Bingham, there are 120 feet of shafting, 4000 feet of tunnels and 510 feet of upraises. Eighteen men are employed and regular shipments of crude ore and concentrates are made.

SUMMIT COUNTY.

Drifting is in progress on the Creole at Park City; drift in 25 feet.——The cable and half of the buckets for the Silver King aerial tram are on the ground and construction work will be pushed. Work on ore depot and the refinery will be pushed also.——High-grade ore is being taken from the Ontario drain tunnel at the 1300-foot mark.

S. Bamberger has bought a three-fourths interest in the Dalberg, at Park City, for $12,500, it is said. After January 1st the mine will be worked by a company which will put in a compressor to be operated by electricity, power being obtained from Provo.

TOOELE COUNTY.

The Sharp M. Co. has levied an assessment of ½ cent per share, delinquent January 4.

WASHINGTON.

FERRY COUNTY.

The Roaring Eagle group, on Bridge creek, 32 miles from Republic, is reported sold to E. L. Tate and others of Spokane; J. Sunk manager.——The Flag Hill, Republic, has temporarily suspended operations owing to inflow of surface water.——The crosscut on 425-foot level of the Mountain Lion is in 180 feet. On the 150-foot level the ledge shows an average width of 8 feet. The shaft will be sunk an additional 200 feet, and, possibly, an additional 400 feet.——The crosscut on the Gold Ledge is in 16 feet from the foot wall.

OKANOGAN COUNTY.

Machine drills are in operation in the Palmer Mountain tunnel, near Loomis. The tunnel is in over 4000 feet.——The tunnel of the Utica-Oro Fino is in 500 feet and crosscutting is now in progress. Ore runs from 1% to 8% copper and $10 to $30 gold to the ton.

SNOHOMISH COUNTY.

A strike of gray copper ore is reported made on 320-foot level of the Monte Carlo. The tunnel is in 330 feet and the pay streak has widened to 14 inches.

SPOKANE COUNTY.

The New York M. Co., capital $50,000, is incorporated at Spokane.——The Silver Queen, near Deep Creek, is shipping ore to the Great Falls, Mont., smelter for a test.

STEVENS COUNTY.

W. E. Newton, manager Newton Copper Co., operating the Newton copper group, just across the International boundary line from Greenwood, B. C., reports shaft down 95 feet.

Work is being pushed on the Copper Bullion. A 250-foot tunnel is in on 80-foot level; A. McKinley Supt.——Work on the First Thought, Bossburg, is being pushed by Supt. A. Sharpe.——The Orient has air compressor, machine drills and a hoist; 500 feet of tunnels are run.——On the Examiner, on Flat creek, F. A. Russell manager, a steam pump and hoist are in and work will be pushed during the winter.

The Lafayette, on Iron mountain, will resume operations within a few weeks.——On Sulphide mountain the Pacific Star Co. is sinking on the Pacific Star.——The Easter Sunday is being prospected with a diamond drill. A 100-foot shaft is sunk on the property.——The tunnel on the old

Eagle, at Chewelah, is said to have opened up a good body of galena recently.

WHITMAN COUNTY.

A find of a 5-foot vein of coal is reported made by Warren & Howe in the Clearwater mountains, 12 miles from Orofino.

WYOMING.

Denver says that Union Pacific officials have bought for $250,000 the Rambler mine, Battle Lake, and that the Union Pacific R. R. may build a spur to the property. G. Doane, the owner, says that the mine has not been sold and that he does not propose to sell it.

FOREIGN.

BRITISH COLUMBIA.

Over 4000 tons ore have been shipped from Slocan lake points this year.——The Chaplean Co., operating near Kaslo, has bought the Clyde Fraction for $10,000, it is said.——The Humming Bird, Grand Forks, is shipping regularly to the Granby smelter.

The new electrical compressor for the Nickel Plate, Rossland, is going in, and stoping is in progress preparatory for shipping ore.——The C. P. R. R. Co. is building 100 cars for Kootenay ore traffic.——The tunnel on the Storm, Slocan, is in 150 feet; crosscutting is in progress on this level. The wagon road up Silver mountain is completed.——The new Boundary Falls pyritic smelter will probably be blown in before Jan. 1st.——A smelter may be erected in South East Kootenay next spring.——Ten thousand sacks of ore are ready for shipment at the Paradise, Windemere.——Supt. E. W. Liljegran of the Humming Bird, Grand Forks, says that shipping is resumed, fifty tons ore being sent to the smelter at that point weekly. The ore averages $20 per ton.——The Stemwinder, Rossland, shaft is down 300 feet. There are 700 feet of crosscuts, drifts, etc.——On the Brooklyn the shaft is down 250 feet.——The sampling mill at the Le Roi, Rossland, is nearing completion.——A diamond drill is working in the face of the north drift on the 350-foot level at the White Bear.

CHILI.

It is said that the Guggenheims will build another smelter on the west coast.

MEXICO.

M. T. Burgess, formerly of Utah, is developing an old Spanish mine at Cerro de Galligos, 100 miles west of Chilpancingo, capital of State of Guerrero, southwestern Mexico. Mr. Burgess says ore will average $50 per ton.

G. Kislingbury, representing New York men, is closing deal for a half interest in the Escuadro (silver), Oaxaca.

Commercial Paragraphs.

W. H. STROUT & SON, who have opened an assay office at 1725 Arapahoe street, Denver, Colo., have put in a double muffle furnace, manufactured by F. W. Braun & Co. of Los Angeles, Cal.

THE Electric Railway & Manufacturers' Supply Co., 548 Mission street, San Francisco, Cal., is the exclusive distributing agent on the Pacific coast for the Ericsson's interior telephone. Replaces speaking tubes for stores, mills, mines, etc.

SECRETARY and General Manager H. W. Hoyt has been elected President of the National Founders' Association at its recent convention in New York. This is the largest body of employers in the United States having the avowed object of promoting harmonious relations with its employes. The Association represents a capitalization of more than $200,000,000.

THE Homestake Mining Co. of Lead, South Dakota, has placed an order with Gates Iron Works for 10,000 special stamp shoes, probably the largest order for stamp shoes ever placed by one company. The Gates Iron Works has been supplying the Homestake Co. with its shoes for several years, the trade having been established under severe competition on the point of quality, the Gates Iron Works having been successful in producing stamp shoes combining great strength and hardness. The order will require fifty-one freight cars to transport it.

ASA M. MATTICE has been appointed Chief Engineer of the Westinghouse Electric & Manufacturing Co., and will enter upon his duties this month. Mr. Mattice was for ten years up to a year ago principal assistant to E. D. Levitt of Cambridgeport, Mass., and has been actively connected with the design of all the large machinery coming from Levitt's office during that time. During the past year he has been remodeling the Cocheco cotton mills at Dover, N. H. Mr. Mattice is an engineer graduate of the Naval Academy of the class of '74, of which class E. H. Warren, vice-president of the Westinghouse Electric & Manufacturing Co., is also a member. He was assistant to Admiral Melville at the beginning of the new navy, and had an important part in the design of the machinery of the Maine, San Francisco and others of the important early ships. The Westinghouse Co. is to be congratulated on the additional strength which he will give to their already strong engineering staff.

Personal.

C. A. CLARK of Mercur, Utah, is in Denver, Colo.

E. C. DEFORREST of Denver, Colo., goes to Florida.

W. SCALLON is elected Pres. Anaconda Copper Co.

M. R. WILBURN of Nevada is in Grass Valley, Cal.

B. S. REVETT has returned to Colorado from Siberia.

GAY LOMBARD of Cedros Island is in San Francisco.

J. J. BLAKE of Salt Lake, Utah, is in Downieville, Cal.

L. D. SIVYER, E. M., of Spokane, Wash., is in Colorado.

H. SNYDER of Culiocan, Mexico, returns there from Salt Lake, Utah.

F. C. LAIRD of Willow River, B. C., will spend the winter in Chicago, Ill.

J. LOWLES of London, Eng., one of the directors of the Velvet, is in Rossland, B. C.

THOMAS COUCH of Montana, Massachusetts and California, is in San Francisco.

A. R. PARKER of Boston, Mass., is examining the Centennial–Eureka, at Tintic, Utah.

D. H. LAWRENCE, Supt. Waldo G. & C. Smelting Co., Waldo, Or., is in San Francisco.

H. H. ROGERS will succeed the late Marcus Daly as Pres. of the Amalgamated Copper Co.

A. C. MORRISON is now general manager Crystalline M. Co., Sonora, Cal., vice T. Mickel.

G. EHRENBERG succeeds Jos. McDonald as manager Helena–Frisco mine, Cœur d'Alenes, Idaho.

R. D. GRANT of Salt Lake, Utah, goes to Butte, Mont., and from there to New York and Boston.

M. D. KELLY has resigned as Supt. Jumper Gold Syndicate properties, Tuolumne county, Cal.

T. F. WALSH of Colorado was elected Pres. of the National Irrigation Congress recently held in Chicago, Ill.

B. H. TATEM of Montana is nominated by the President to be assayer in charge of the assay office at Helena, Mont.

F. KLEPETKO, general manager Anaconda and Butte & Boston properties, Butte, Mont., is in Salt Lake, Utah.

H. TREMBATH is appointed foreman of principal Gold Hill mines, Eureka, Nev., vice J. Langan, now in California.

A. BORDEAUX, general manager Ralston Divide G. M. Co., Long Canyon, Cal., will spend the winter in Georgetown, Cal.

T. H. OXNAM has gone from Redding, Cal., to examine property in the vicinity of the Palmarijo mines, Chinipas, Mexico.

J. B. HARRELL, formerly of DeLamar, Idaho, now has charge of the 100-stamp mill of the San Luis Valley M. Co., Crestone, Colo.

JOS. MCDOWELL, late manager Frisco Con., Wallace, Idaho, goes to Alaska to take charge of the Treadwell mines on Douglas Island.

A. C. WEHE, Pres. and general manager Milwaukee–Palmer Mountain G. & C. M. Co., Weheville, Wash., will spend the winter in Los Angeles, Cal.

J. M. BOUTWELL of the United States Geological Survey has completed the survey of the Bingham, Utah, district, and returns to Washington, D. C.

A. L. WATERS of Globe, Ariz., has returned to Matape, Sonora, Mexico, where he is in charge of mines owned by the British Gold Mines of Mexico Co.

S. E. BRETHERTON, Denver, Colo., has been engaged of late examining various properties with the view of introducing his method of pyritic smelting where conditions are found adaptable to it.

CALEB WHITEHEAD, the special commissioner who was sent by the United States Government to Alaska to examine the gold deposits of the Seward peninsula, has returned to Washington and is now engaged upon the compilation of his official report. Dr. Whitehead was recently offered, and refused, $20,000 a year to join the Turkish Government as metallurgical adviser.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING NOV. 27, 1900.

662,757.—JAR CLOSURE — Mae Birney, New Whatcom, Wash.
662,665.—CULTIVATOR — G. L. Bradley, Palaha City, Wash.
662,684. — PAVING BLOCK PRESS — J. Brower, Oakland, Cal.
562,685.—AMALGAMATOR—I. P. Clarke, Alameda, Cal.
562,895.— UNDERREAMER — W. Duncan, Los Angeles, Cal.
662,563.—HAND CAR—Hall & Gray, San Marcos, Cal.
662,623.—GRATE BAR—T. W. Heintzelman, Sacramento, Cal.
662,597.—SIDEWALKS, ETC.—P. H. Jackson, S. F.
662,625.—TYPE CASE—H. L Keyte, Merlin, Or.
662,871. — FIREPROOF STRUCTURE — D. Kilpatrick, Los Angeles, Cal.
662,540.—VEHICLE AXLE—A. C. Massey, Los Angeles, Cal.
662,677.—HOOK AND EYE—Nevada McMahon, S. F.
662,573.—REPRODUCING TYPE—W. H. B. Miller, Oakland, Cal.
662,576.—ROLL PAPER HOLDER—T. C. Phillips, S. F.
662,818.—SHINGLE JOINTER—J. Randall, Gate, Wash.
662,552.—STEAM TRAP—J. St. Mary, S. F.
662,597.—PHOTO MOUNT—P. J. Stuparich, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

REPRODUCING TYPE OR THE LIKE.—No. 662,573. Nov. 27, 1900. W. H. B. Miller, Oakland, Cal. This invention relates to a means for reproducing metal type, both face and body, from any corresponding type and at a single operation without the use of a pattern or need for finishing processes. It consists of a mold-box having a movable side between which and the fixed side of the box the type may be fitted, spacing blocks adjustable in the channel thus formed to fit upon each side of the type, a bottom formed of enameled surface blotting paper, in which an impression of the type face may be made by a blow or pressure, a cap fitting the top of said mold having an opening, a melting pot and guides therefor and a gate movable under the opening and means for opening said gate in unison with its adjustment to the molding-box.

PROCESS OF PRODUCING PHOTOGRAPHIC MOUNTS.—No. 662,579. Nov. 27, 1900. P. J. Stuparich, San Francisco, Cal. The object of this invention is to produce variously shaded card mounts for photographs by proper blending of suitable inks upon the printing plate, and so mounting the plate and the cards which are to be printed as to properly apply the shade at a single impression. It consists in removing the center from the printing plate and applying a shaded ink to the remaining portion of the plate to form a deepening tint from one side or angle to the other and bounding an uncolored center, finally impressing the plate upon a card placed to receive the impression.

HOOK AND EYE.—No. 662,667. Nov. 27, 1900. Nevada McMahon, San Francisco, Cal. This invention relates to hooks and eyes for clothing. It consists of a hook formed by bending wires substantially as shown to form a bight which comprises the hook, divergent portions of said wire upon each side and above the level of the hook and divergent and rectangular fastenings formed at front and rear upon opposite sides of the structure. An eye is formed by a curved bight adapted to enter between the guards and engage the hook, the wire diverging from the base of the eye to form exterior angles, and thence converging, extending parallel and finally turned outward to form rectangular fastening loops.

Latest Market Reports.

SAN FRANCISCO, Dec. 6, 1900.

SILVER—Per oz., Troy: London, 29⅞d (standard ounce, 925 fine); New York, bar silver, 64⅝c (1000 fine); San Francisco, 64½c; Mexican dollars, 51c.

COPPER.—New York: Lake, 1 to 3 casks, $17.25 cash; carload lots, 17.00; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.50; Casting, 1 to 3 casks, 16.75; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.32½; Salt Lake City, $4.00; St. Louis, $4.25; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £17 per ton=3.67c per ℔.

SPELTER. — New York, $4.35; St. Louis, $4.15; San Francisco, ton lots, 5¾c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $14.50; gray forge, $14.00; San Francisco, bar, per lb., 2½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $20.00; open hearth billets, $23.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $28.50; San Francisco, ton lots, 30c; 1000 ℔s., 30½c; 500 ℔s., 30¾c; less, 31c; bar tin, ⅌ ℔, 35c.

QUICKSILVER. — New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.00 ⅌ flask of 76½ ℔s.; Export, $45.

NICKEL.—New York, 50@60c ⅌ ℔.

MAGNESIUM.—New York, $3.00 ⅌ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¼c; slab, 5¾c; bar, 7c.

BABBITT METAL.— San Francisco, No. 1, 10c.

SOLDER. — Half-and-half, 100-℔. lots, 18.70c; San Francisco, Plumbers', 100-℔. lots, 15.85c.

ASSAY LITHARGE.—San Francisco, 10c ⅌ ℔, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

BISMUTH.—New York, ⅌ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

PHOSPHORUS. — F. o. b. New York 50@60c ⅌ ℔.

TUNGSTEN.—New York, ⅌ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.— San Francisco, crude, $17 ⅌ oz.; New York, $18.20 per Troy oz

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¼c; less than one ton, 15¼c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ⅌ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32½@33½c ⅌ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ⅌ ℔.; soda ash, $1.60 ⅌ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ⅌ ℔.; blue vitriol, 5½@6c ⅌ ℔.; borax, concentrated, 7@8c ⅌ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ⅌ ℔.; caustic soda, in drums, 3@4c ⅌ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ⅌ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

MINING AND SCIENTIFIC PRESS. AND PACIFIC ELECTRICAL REVIEW.

Whole No. 2108.—VOLUME LXXXI. Number 24. SAN FRANCISCO, SATURDAY, DECEMBER 15, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Link-Belt Stair Lift.

The latest contribution to elevating machinery for passengers is the Link-Belt stair lift, the invention of the president of the Link-Belt Engineering Co., James Mapes Dodge of Nicetown, Philadelphia.

The stair lift, of which are here presented several illustrations, departs radically from other machines designed for this purpose and possesses many unique advantages. Its general appearance is that of the familiar one-flight staircase. A great number of steel links are so assembled as to make a belt flexible in one direction and rigid in the other, which is fitted at intervals with shafts carrying self-oiling rollers. By means of a stationary frog, which switches the rollers alternately into the upper and lower channels of the steel sides, treads and risers are formed at the base, presenting a smooth, flat surface on which the passenger steps as naturally as upon a regular step and maintains his position, the steps sliding upward without jar to the floor above, when they disappear around the sprocket after delivering the passenger independent of any effort of his own.

FIG. 1.

The treads and risers after passing around the head roller again become a flat belt, thus reducing the space required for their return and making the vertical depth of the stair lift but a trifle more than of an ordinary stairway.

This construction makes a strong and noiseless apparatus of light weight, so that buildings of reasonable strength can carry the machine without the necessity of building special foundations.

The Link-Belt stair lift occupies but little space on either floor. Its width from rail to rail is 3 feet. The belt constituting the steps is 21 inches wide, experience having shown that greater width does not give increased actual carrying capacity. The width of the steps and slant of the risers prevent overcrowding and insure comfort to passengers when every step is occupied. Traveling at the rate of 90 feet a minute, with a passenger on each step, 3000 per hour can be elevated without crowding and without the delays due to waiting for an elevator. This is six or seven times the capacity of large passenger elevators of the best type. Under maximum load, 5 H. P. electrical current is required to operate the machine, and as no attendant is necessary to load or unload passengers, its cost of operation is limited practically to the price of the current.

The treads being level, and the forward movement of the machine of remarkable smoothness, no traveling hand rail is used or required, the footing being firm. This gives to the passenger the free use of both hands, an advantage greatly appreciated where they are accompanied by children and carrying parcels. The machines can be finished to harmonize with even the most esthetic surroundings. They can be stopped or started from either floor instantly, and in case of panic or fire may be used as an exit. The five figures portrayed herewith are self-explanatory of the device described, that will be noted with interest in connection with its manifest need and convenience.

Patents for Pacific Coast Inventors; Notices of Recent Patents; Personal; Recently Declared Mining Dividends; Commercial Paragraphs; Books Received, 589.

IT has been the pleasure and the privilege of this paper for forty years to get commendatory letters from men whose good opinion was worth having, and who, in renewing their subscriptions, have said kind words regarding the value of the paper to them. Year by year many of those who so wrote have crossed the great divide; but yet, as the years go by, come in increasing numbers the same kindly commendations from an ever widening circle of new readers who like the paper and say so. The paper is cordially appreciative of such universal good-will, and is glad to carry into the next century consciousness of continued friendship and interest on the part of so many that seems to increase in numbers and extent as the years go by.

PROBABLY no modern invention has been proved capable of more extended and developed use than the telephone. Every month evolves some new economic phase of its applicability. The latest is the reported project of the Northern Pacific Railway Company to substitute through telephone service for its telegraph line, with intent to use the telephone to the entire discarding of telegraph and mail service. The plan does not seem wholly feasible, and the matter must be looked upon as an experiment. In large establishments the telephone is now used as a great saver of time, affording instant communication with different heads of departments and the various employes. The long-distance telephone service has seriously cut the business of several Eastern railroads, it being quicker, cheaper and a saving of time for business men to talk from Chicago to New York or Cincinnati to St. Louis instead of making railway trips to and fro.

THE review of West Australian mining law, the subject of a specially written paper on page 581, is interesting in connection with the long continued and unsuccessful effort to secure needed changes in U. S. mining law. The colonies do not seem to be above profiting by experience. Since the last (or latest) election of Stewart of Nevada to the U. S. Senate, this journal has postponed hope of manifestly necessary changes in the Federal mining law—changes made mandatory by conditions that do not wait upon musty precedent or "senatorial courtesy." The suggestion in the article in this issue regarding the erection of public reduction plants has been a favorite idea among some mining men for several years, but can not meet with unqualified approval. Anything of so paternal a tendency is not to be strenuously advocated. Those things can best be settled by the laws of private economic advantage, and, while the idea may work well in Australia, it would be a probable failure here, as the whole thing would soon become the prey of professional politicians.

Of Public Value.

Under the auspices of the California State Mining Bureau has been published Bulletin No. 19, the result of extensive research on the part of W. L. Watts, E. M., concerning the oil and gas yielding formations of California. The importance of the oil interest and the magnitude of operations therein demanded such work, and the bulletin forms a compendium of up-to-date scientific information on the oil fields of California. It is of further value to any and all anywhere interested in the geological circumstances attendant thereon, or in the economic values of such production.

In the last four issues of this paper have appeared copious extracts from this latest bulletin; and now that the monograph itself has appeared, it is commended to those who want complete information on the subject of which it treats. The work has been carefully and accurately compiled, and, like other publications of the California Mining Bureau, will doubtless be in universal demand.

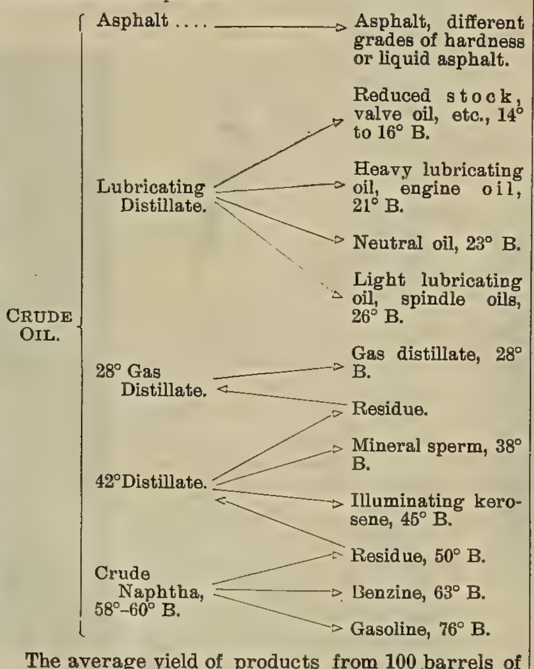
In addition to the special articles contributed to this paper on the subject of relative oil values, and bye-products which have appeared during the last three years, there is considerable matter in the latest bulletin that deserves notice because of the applicability in all parts of the country of the specific information furnished.

The bulletin shows that the ultimate analyses of samples of oil from California and the Eastern States compare as follows:

Locality Where Oil Was Obtained.	Specific Gravity.	Nearest Degree..	C........	H........	O........	N........	S........
Oil Creek, Pa.	0.730	62° B.	82.0	14.8	3.2	......	....
W. Virginia..	0.840	36° B.	84.3	14.1	1.6	......	....
California....	......	......	86.934	11.817	....	1.1095	....
California....	0.920	22° B.	84.0	12.7	1.2	1.7	0.4

An examination of the foregoing table shows that in the California oils the content of carbon as compared to that of hydrogen is greater than it is in oils from Eastern States. Dr. Salathe says: "The refining of the crude California oils is not an easy task, and they require refining methods different from those practiced with Eastern or Russian oils. The complicated nature of this class of asphaltic crude oils necessitates complete elimination of all unstable hydrocarbons by inexpensive practical processes. Another great difference exists between the specific gravities of Eastern oil distillates and those of California oils. Viscosity of distillate or reduced stock being equal, the gravities are from 5° to 6° B. lower in California oil fractions than in those of Eastern oils. Flash and fire tests are from 10° to 30° F. lower in California oil distillates than in Eastern distillates of the same gravity."

Following is a diagram of products available from California crude oil by refining, showing where redistillation is required:



CRUDE OIL.

Asphalt, different grades of hardness or liquid asphalt.
Lubricating Distillate.
Reduced stock, valve oil, etc., 14° to 16° B.
Heavy lubricating oil, engine oil, 21° B.
Neutral oil, 23° B.
Light lubricating oil, spindle oils, 26° B.
28° Gas Distillate.
Gas distillate, 28° B.
Residue.
42° Distillate.
Mineral sperm, 38° B.
Illuminating kerosene, 45° B.
Residue, 50° B.
Crude Naphtha, 58°-60° B.
Benzine, 63° B.
Gasoline, 76° B.

The average yield of products from 100 barrels of Ventura county mixed crude oils of 24° B., determined by actual running on a large scale, is as follows:

	Bbls.
Gasoline, 76° B	3
Benzine, 63° B	4
Kerosene, 45° B	15
Heavy kerosene, 38° to 40° B	8
Gas distillate, 28° B	21
Light lubricating (spindle) oil, 26° B	10
Neutral oil, 23° B	12
Heavy neutral oil, 21° B	6
Reduced stock, lubricating oil, 14° B	5
Asphalt, crude	11
Loss	5

The bulletin continues: "The extraction of pyridine bases with dilute sulphuric acid should be done before the redistillation of the distillates, as the treatment of those distillates with concentrated sulphuric acid will otherwise form certain sulpho-conjugated products, which, during the washing process with water and alkali, decompose and reenter into solution with the refined products."

"The petroleum of the Eastern States is composed principally of hydrocarbons of the paraffine series. As previously mentioned, by far the greater portion of the California oil is used for fuel, and that in a crude state. It is the general opinion of those who use oil as fuel that, weight for weight, there is not much difference between the fuel value of oils of different specific gravities, provided the oils are clean, or a suitable allowance is made for water and other foreign substances which they contain. A portion of the oil is used for fluxing asphaltum and for the manufacture of illuminating gas, and a portion is refined. The portion refined yields crude naphtha, illuminating oil, gas distillate, lubricating oil and asphaltum. The naphtha distilled from California oils is of special value for use in gasoline engines. Those who have made comparative tests of California and Eastern gasoline in gasoline engines claim a superiority for the California product.

"As might be expected from the foregoing statements concerning the relative composition of petroleum from the Eastern States and the asphaltic oil of California, illuminating oil manufactured in this State contains more carbon and less hydrogen than does illuminating oil manufactured from Eastern petroleums. The result is that, when burned under similar conditions, California oil gives a more smoky flame than does oil manufactured from Eastern petroleum. This is due to the fact that it requires more oxygen to effect the complete combustion of carbon than it does to consume hydrogen."

"There is no doubt that, as time goes on, more use will be made of the constituents of our asphaltic oils in chemical manufacture."

FUEL VALUES OF CALIFORNIA PETROLEUM COMPARED WITH FUEL VALUE OF COAL.

	Available Heat Units in One Kilogramme.	Available Heat Units in One Ton, Calculated as 909 Kilogrammes.	One Ton of 2000 Lbs. Nanaimo Coal and Equivalent in Bbls. of Petroleum........
Nanaimo coal..............	6,684	6,075,756	....
Sample of petroleum, 15° B., from practical working test in locomotives on Southern Cal. R. R.....	......	9,886,585	3.870
Sample of crude petroleum, 16.5° B............	9,800	8,908,200	3.487

Sample of Los Angeles oil, 13° B..................	10,203	9,274,527	3.630
Maximum fuel value obtained in calorimetric tests....................	10,381	9,436,329	3.693
Minimum fuel value obtained in calorimetric tests....................	9,991	9,081,819	3.554
Sample of Summerland oil (crude)................	9,688	8,806,392	3.447
Sample of Summerland oil extracted by naphtha...	10,242	9,309,978	3.644

The relative fuel value of coal and Los Angeles oil, as shown by combustion in furnaces, is given as follows: The heating furnaces of Los Angeles Steel & Iron Co.: One ton Wellington coal equals 2.50 barrels of oil; for steam purposes, one ton of Wellington coal equals 3 barrels of oil. Los Angeles Consolidated Electric Railroad Co.: Steam purposes, one ton of Wellington coal equals 3.62 barrels of oil. Los Angeles Courthouse: Steam purposes, one ton of good coal equals 3.10 barrels of oil. Southern California Railroad Co.: Steam purposes, one ton of Nanaimo coal equals 4 barrels of oil.

Concentrates.

A LAKH OF RUPEES is $32,100.

THE California State Miners' Association is not incorporated.

T. M. LOMBARD at Cedros island uses salt water for amalgamation.

ONE person can not locate 160 acres placer ground; eight, jointly, can.

THERE is no substance which will render dry paper an electrical conductor.

A PLACER MINING CLAIM can be located within the limits of a Government forest reservation.

THE gold commissioner at Dawson estimates the season's Klondike output of gold at $20,000,000.

CYANIDE OF GOLD is insoluble in water but is soluble in alkaline sulphides and sodium hyposulphite.

A LIFTING MAGNET can not be made with an alternating current; direct current must be employed.

NO LEGAL mining location can be made on land on which agricultural patent has regularly issued.

GRANOLITE is a generic term for granular igneous rocks of all kinds, syenite, granite, gabbro, etc.

REGARDLESS of what is asserted in advertisements or otherwise, any corporation stock in California is assessable therein.

CHROME ORE carrying 50% sesquioxide of chromium is worth about $10 per ton in San Francisco and $20 in New York City.

NOTHING has been received from the Chemical & Metallurgical Society of South Africa since the breaking out of the Boer war.

WHERE a dyke accompanies a vein, it is ordinarily to be considered more as an indication of permanency than of richness of the fissure.

MINING STOCK may be issued either for cash or property in Colorado. Where issued at par, for cash, "full paid," it is non-assessable.

HYDROCYANIC ACID, or "Prussic acid," or hydrocyanide, is a very poisonous gas, formed by the action of acid on cyanide of potassium.

A "50-TON PLANT," in the sense referred to, means that the capacity of the roller mill is to put through fifty tons in twenty-four hours.

LIQUID AIR is the extreme limit of compressed air; its boiling point is 312° below zero F.—that is, it boils at 524° F., below the boiling point of water.

PAPER can be made fireproof by moistening with a solution of ammonium sulphate, 8 parts; boric acid, 3 parts; borax, 2 parts; water, 100 parts.

THERE remain sixteen days in which the necessary $100 assessment work can be done on unpatented mining claims located since Jan. 1st, 1899.

THE eightieth meeting of the American Institute of Mining Engineers—its thirty-first annual meeting—will be at Richmond, Va., beginning Feb. 19, 1901.

THE subject of earth backing for masonry dams is one of constant discussion, with the strength of the argument apparently in favor of those who oppose such practice.

"CONCENTRATES" does not know what causes the magnetism of the earth, but believes that it is caused by its great weight and the speed at which it rotates on its axis.

AN alloy of aluminum with magnesium is even lighter than aluminum and can be worked like brass—that is, it can be turned, bored, etc.—but does not file quite so readily as brass.

DURING the first half of the current year the Mountain Copper Co., Keswick, Cal., produced and smelted 99,948 tons of ore, which yielded 5038 tons of copper, the ore carrying about 5%.

THE three pages of mining summary published weekly give the latest and most authentic information to manufacturers and furnishers of mining supplies regarding contemplated purchases.

ELECTRIC ground connections made by attaching wires to water pipes will ruin the pipes themselves by electrolysis, and will also seriously interfere with the operation of the water meters.

IT was a French mechanic, Lenoir, who first produced motive power through the explosion of illuminating gas —1861—and a German mechanic, Otto, who made the first atmospheric gas engine in 1867.

SILICA BRICKS are made at Mt. Union, Pa., and inquiry addressed to W. A. Haws, there, should elicit the desired information, from the quarrying of the ganister to the loading of the finished product.

SHOULD the South African Republic be declared an English colony, it is probable that the cyanide patents declared invalid by a South African court will be recognized as valid as in other British colonies.

THE third annual session of the International Mining Congress was held in Milwaukee last June and was not a distinguished success. The fourth session is set for Boise, Idaho, next July and may not convene.

AN engine or locomotive having cylinders 19 inches diameter by 24 inches stroke, having an average cylinder pressure of 53.7 pounds per square inch, the driving wheels 78 inches diameter, and making 260 revolutions per minute, develops 959 H. P.

"CROSS TALK" in a telephone is occasioned by the wire of a grounded circuit close to the line on which the "cross talk" is heard. The evil is obviated by the use of a metallic return wire twisted around the other wire of its own circuit.

IT is not necessary to the validity of a claim that the discovery of mineral should be made in the "discovery shaft." A discovery either within the shaft, or in any other part of the surface ground within the limits of the claim, is sufficient.

THE best paper on mica that "Concentrates" knows of is one by J. A. Holmes, "Mica Deposits and Mica Mining in the United States," read at the Washington, D. C., (February, 1900) meeting of the American Institute of Mining Engineers.

IN lacing belts, if the ends of the lace leather are gently charred over a match—not too much—it will be found that they have acquired a stiffness and rigidity sufficient to enable them to be pushed through the holes in the belt with ease.

IT now takes about 1½ ounces gold to buy what 1 ounce of gold would have bought in the way of miners' supplies two years ago. Nearly everything that miners buy has advanced in price, except candles, powder—and the MINING AND SCIENTIFIC PRESS.

THE mineral collection at the State Mining Bureau, Ferry building, San Francisco, is probably the finest and most completely representative of any in the country. There is also a creditable exhibition of minerals in the Academy of Sciences, on Market street, San Francisco.

IN the electrical extraction of mercury the cinnabar ore is crushed to a fine state of division, and is then treated with a hot solution of sodium sulphide containing sodium hydrate. The electrolytic vats are of iron and may be used as cathodes. The anodes are made of steel.

WITH mining stocks "cheap" is a relative term. There are good "cheap" stocks: cheap because the property they represent is not yet developed into a paying mine. Perhaps when they get to selling for five times what they do now some of those stocks will be "cheaper" than they are now.

THE Commissioner of the General Land Office states that mining locations cannot be legally acquired within the limits of the meander lines of Rogue river, Or., that the State of Oregon has full control of the mineral in the river, and that the only way to proceed legally is to lease from the State.

THE American Iron & Steel Association of Philadelphia can give a complete list of the steel works in the United States, and the Gold & Silver Extraction Co. of America, Ltd., McPhee building, Denver, Colo., can give an approximately complete list of the cyanide plants in the United States.

ALMOST any number of this paper since July, 1892, has some valuable reference of technical detail concerning the cyanide process. To look through some volumes of the paper at any public library of any consequence should afford a fair idea of the principles and practical operation of the process.

IN California the Standard Electric Co. uses a 30-inch pipe, 1485 head, 640 pounds pressure; the Blue Lakes Water Co., 22-inch pipe, 1040 head, 451 pounds pressure; the Mt. Whitney Power Co., 20-inch pipe, 1300 head, 574 pounds pressure; the San Joaquin Electric Co., 20-inch pipe, 1411 head, 612 pounds pressure.

ACCORDING to figures from the San Francisco custom house, the U. S. Government has received from California to June 30, 1900, from internal revenue $111,000,000, from custom duties $264,000,000. California has yielded a gold total of about $1,400,000,000. The Government has spent about $13,000,000 on California—about three-fourths of 1% of what it has received.

AS EXPECTED, the "Concentrate" in the issue of Nov. 17 about longest ore shoots has elicited several statements as to extraordinary lengths of ore shoots. The longest heard from is that of the Smuggler-Union, San Miguel county, Colo., which is claimed to be "over a mile long, with one stope of 800 feet, where the ore holds its width and grade unbroken."

TO RECLAIM the gold from the gold-toning powder, which contains borax and soda, dissolve the powder in water, then add a solution of sulphate of iron, which will precipitate the gold as a black powder. Then decant the solution, wash the powder and dry it. The powder is now to be redissolved with nitro-muriatic acid, evaporated and again redissolved, when chloride of gold, free from acid, will result.

ALIENS can not legally locate or hold mining claims. An alien who has never declared his intention to become a citizen is not a qualified locator of mining ground, and he can not hold a mining claim, either by actual possession or by location, against one who connects himself with the Government title by compliance with the mining laws. But, upon declaring his intention to become a citizen, an alien may have advantage of work previously done, and of a record previously made by him in locating a mining claim on the public mineral lands.

THE tensile strength of any material is the resistance it offers to being pulled apart. When one speaks of the plates in a boiler having a tensile strength of 50,000 pounds per square inch, it is meant that if a bar of the same metal, 1 inch square, is subjected to a stress of 50,000 pounds, it will break. This is called the breaking stress and also the ultimate tensile strength. The resistance of a plate is proportional to the area of its cross-section. When it is required to find the breaking stress of any piece of material, we find the area at the minimum cross-section, and multiply it by the strength per square inch. The tensile strength of wrought iron may be taken as 50,000 pounds per square inch of section; that of steel, 70,000 pounds per square inch of section. These figures may not always be found correct; an actual test only can determine just what the tensile strength is. The term safe tensile strength refers to the load per square inch that can be borne in safety by a piece of material. In boilers, it is usually taken at from one-sixth to one-fifth the ultimate tensile strength of the material.

THE Commissioner of the General Land Office says: "Contests may be initiated against any entry filing or other claim to the public lands. There must be something to protest before proceedings can be instituted. The mere fact that land is in railroad limits does not constitute a claim, because mineral lands are excepted from the grant to the railroad. This position is illustrated by the fact that no notice to the railroad company is required of a mineral application or entry for land which has not been listed or selected. The fact that lands may be selected under the Act of June 4, 1897, is no reason to allow protest for land which at the time of filing is absolutely free from any claim. The public land laws contemplate that parties possessing a claim to the public lands will proceed to patent therefor. This is, of course, not necessary to invest mineral claimants with a vested right to their claims, but a mere protest is not a filing or a claim of record; it does not segregate the land and should not be received or noted on the records. Parties desiring to protect their claims, without proceeding to patent therefor, must advise themselves as to any adverse claims and then proceed under the rules." These rules were published in full in the first volume of the issues of 1898.

THE simplest method of calculating the pressure that wrought iron and steel pipes will stand is as follows: $P = \frac{T \times t}{R} \div c \times f$. Where P = safe working pressure. T = tensile strength of plates, taking iron at 48,000 lbs. to the square inch and steel at 75,000 lbs. t = thickness of plates in inches or decimals of an inch. R = radius of pipe in inches. f = proportional strength of plates, as follows: When double-riveted = 0.7 and single-riveted = .5. c = a coefficient or factor of safety, usually taken at 3. p = pressure in pounds per square inch due to head of water. Example: What is the safe working pressure for a 36-inch pipe, double-riveted along the longitudinal seams, and made from wrought iron plates, rolled across the grain, and ⅛ of an inch thick? Answer: $P = \frac{\overset{T}{48000} \times \overset{t}{.125}}{18} \div \overset{c}{3} \times \overset{f}{0.7} = 77.7$ pounds to the square inch, or 179 feet pressure head. By means of the same formula the thickness of plate is easily found that will safely stand any given pressure. For instance: $t = \frac{P \times R \times c}{T \times f}$. Example: Having a pressure of 179 feet, or 77.7 pounds to the square inch, what thickness must the wrought iron plates be for making a pipe 36 inches in diameter? Answer: $t = \frac{\overset{P}{77.7} \times \overset{\text{radius}}{18} \times \overset{c}{3}}{\overset{T}{48000} \times \overset{f}{0.7}} = .125$ inch.

IN recovery of the silver in the U. S. Mint, the silver solutions, together with the wash waters from the gold treatment, are transferred to a precipitation tank—capacity 2000 gallons, never filled to its full capacity, since abundant room must be left for stirring and rousing the contents. Salt water is run into the silver solution until a test shows that enough has been added to convert all silver present into chloride. An excess is avoided, since silver chloride is slightly soluble in salt water. The contents of the tub are drawn off through a filter, a wooden tank 6½ feet long, 3 wide and 1¼ in depth, lead lined and provided with a perforated false bottom, the bottom and sides carefully covered with cotton cloths as a filtering medium. The curd-like silver chloride is run into this filter through a large wooden stopcock. The liquid which drains off is returned to the filter until it runs clear, after which it is passed through several traps to the sewer. Fresh water is passed through the chloride until all soluble matters are removed, when it is allowed to drain. The filter tank is mounted on low wheels for convenience of removing the chloride to the reducing vat. This is again a lead-lined rectangular tank. The silver chloride is transferred to this tank by a copper scoop shovel. Hot water is run on, and granulated zinc added in sufficient quantity to reduce the chloride to metallic silver. The addition of sulphuric acid hastens the action and serves to dissolve the slight surplus of zinc which it is necessary to use to insure complete conversion into metallic silver. The reduced silver is now taken out with a copper scoop having a shovel handle and put into a filter colander, in which the silver is washed with hot water until entirely sweet. It is now ready for compression into solid cakes by hydraulic pressure. These cakes are dried in a current of hot air, when they are ready for melting. This is usually done without fluxes, and the resulting bars have a fineness of 0.998 to 0.999.

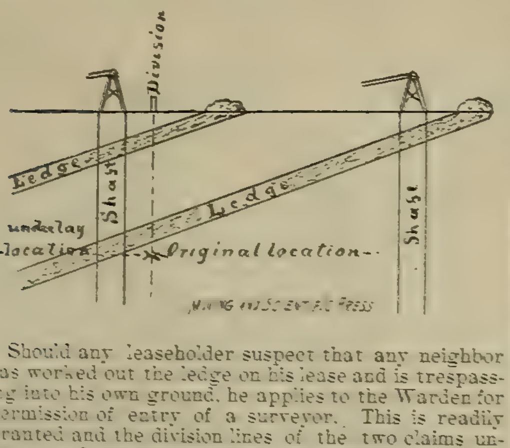
Review of West Australian Mining Laws: A Comparison.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE HOPE.

The American mining laws, created over a quarter of a century ago by legislators not practically acquainted with the subject on which they framed their enactments, have worked out constantly in practice, not so much to the benefit of the industry they were intended to serve, as to the individual profit of those interested in stirring up litigation on all possible points. There is scarcely a clause on the statute book through which a coach and four can not be driven by the skilled legal practitioner, and while the mining industry, of all others, has been a record of constant progression, the laws that govern it have virtually stood still, till a demand, universal and imperative, has arisen for amelioration and revision. That a radical change need not be necessarily hostile to vested interests has been proved in the successful efforts to bring the laws and regulations up in line with the requirements of the industry that have engaged the attention of the Australasian parliaments almost every session of late years.

In the case of West Australia, in what was practically a sterile desert a decade ago, one-third the size of the United States, a gold-mining population is now peaceably working under laws that embrace every phase of widely differing interests with a maximum of security and a minimum of litigation. True, in the case of a new country, the lessons learned the world over in practice could be and were applied without friction, and many valuable suggestions may be gained from a brief review of the salient features which have tended towards a successful control of the industry there and may serve to guide judgment in the revision of the law so urgently needed at home.

The fundamental principles of the Australian statutes as applied to mining differ essentially from those of the United States. Where lands were alienated from the Crown in times past, no reservation of minerals was made, and a special Act dealing with "mining on private property" was passed. The provisions of this Act are in no wise so liberal as our own laws in similar case. Most of the metalliferous country, however, lies in the barren interior, and the fee simple to this remains vested in the Crown, areas being leased in tracts not exceeding twenty-four acres for a term up to twenty-one years at an annual rental of $5 per acre, and the fulfillment of certain labor conditions defined by law are a part of the rental due and payable. No patents are ever issued. Another essential point of difference lies in the fact that there are no extralateral rights to cause conflict, a lessee being only entitled to the minerals within his corner pegs. Thus, if a ledge dips at a shallow angle out of a leased area, it belongs to the holder of the adjoining ground on the underlay side so soon as it passes beyond the limit of the side line of the original claim. A lease may not exceed in length along the line of the ledge more than twice its breadth, but there is nothing to prevent a person taking up two, or even three, leases, side by side, covering the underlay of a ledge to an indefinite depth. The object of the limitation of the lease area is twofold. It prevents the locking up of large tracts of valuable ground without adequate development, and it conserves the rights of labor in a democratic community equally with those of capital, for the employment of one man to every six acres is compulsory on each and every lease. Easements and exemptions are allowed, if applied for in open court, when objections from any interested party may be lodged, for certain specified reasons, such as inflow of water, collapse of workings or shaft, absence of machinery, or other cause, deemed sufficient by the Warden of the Goldfield. In the case of two or more parallel ledges, the underlay claim is often more valuable than the original location, though there is no reason why the first locator should not have secured them both. Thus:



Should any leaseholder suspect that any neighbor has worked out the ledge on his lease and is trespassing into his own ground, he applies to the Warden for permission of entry of a surveyor. This is readily granted and the division lines of the two claims underground are correctly ascertained. Cases have occurred where a ledge, after going down a hundred feet or so, has turned and come up to the surface again on an adjoining holding. Here, this might cause endless trouble; in Australia it creates none. The same is true of a Y-shaped vein with two outcrops. It is immaterial which is the prior location or which the mother vein and which the feeder.

The same argument holds with ledges that cross each other or lie partly in one claim, partly in another.

Two main divisions are recognized in the Australian laws, one portion being devoted to alluvial, or placer, mining, the other to reef, or ledge, mining. In West Australia water is absent: the country is flat and the gold lies close to the ledge from which it was derived. Dry washing, or, as it is called there, "dry blowing," is the means of recovery availed of. An alluvial may work ground up to within 50 feet of the ledge or leased ground. He may enter upon any lease and call up the owner or manager to define the strike of his ledge, and may work up to 50 feet of such line on either side. In Queensland no leasing is permitted until two years after discovery of auriferous ground, so that the alluvial may first exhaust the surface deposits. In West Australia ground known to contain alluvial gold can not be leased until abandoned by the alluvial diggers. The surface deposits being shallow and the process of alluvial recovery rapid, no great injury is worked to the deep mining industry as a whole.

For quartz mining the process is as follows: Armed with his miner's right, the prospector maps the outcrops till sufficient color warrants a location. He then has the right to mark out a prospecting area 160 yards square to hold the ground while he investigates its merits. This "pegging out" will hold the ground for thirty days, at the end of which time he must register his claim (cost $2.50) at the nearest registrar's office. This affords a clean title till payable gold is struck, when notice must be given to the Warden and a lease applied for. A lease, of course, may be applied for on any ground without first holding it as a prospecting area, which is designed for the poor man only. When a lease is desired, the area wanted is defined by corner pegs, trenches and cleared lines as nearly correct as possible; notices of intention are posted and application made for the lease within ten days of marking. The fees must be paid on application, $5 per acre per year rental being deposited for the first year in advance, together with the fee for survey, from $20 to $50. At the end of thirty days the application is heard in open court, when all objections are considered. If no valid objections are sustained, the lease is recommended by the Warden and issued later by the Minister of Mines. Immediately upon its recommendation the labor conditions come into force. For the first six months one man for every twelve acres; after that, one man for every six acres, must be constantly employed for eight hours five days in the week, four hours on Saturday. A lapse of three days in the labor conditions renders a lease liable to forfeiture on the application of any person applying for the same and proving the default. The case is tried by the Warden in open court and his decision is handed to the Minister for decision. The fulfillment of the labor conditions is part of the consideration paid to the Government for the lease.

When several leases are held by one ownership the Warden may, on application, allow the due complement of labor for the total lease to be concentrated on one particular lease. The object in all cases is to have the ground developed and prevent its being locked up in large areas by speculators. Under these laws scores of propositions were floated on the London market during the late mining boom at Coolgardie and Kalgoorlie. To the bona fide company no hardship was worked. Working capital was subscribed and active mining prosecuted. To the wildcat concern it proved a wholesome deterrent. After excuses for idleness were exhausted in the Warden's court on pleas for exemption, the properties were mostly abandoned, if worthless, or leased on tribute. The writer recalls a dozen properties held by London companies that, through bad management or other cause, were abandoned or shut down, and which are now producing ore running from $15 to $40 per ton in the hands of practical men or working tributors. Non-payment of rent will forfeit a lease, also, and the conditions appear stringent at first sight; it is under these conditions that Kalgoorlie, with its gigantic plants and invested capital, is working its mines to-day. The principle, though novel and socialistic, is sound in practice and has tended to purify gold mining, as an industry, of some of its worst and most unwholesome abuses.

For purposes of efficient jurisdiction, the auriferous country in Australia is divided into separate gold fields, each under the charge of a Warden and a Registrar. A Warden's court is established, in which mining disputes are tried, pleas for exemption from labor conditions heard and the like business transacted. No one has a locus standi in this court without a miner's right, which every miner is required to secure and renew annually at a charge of $2.50—formerly $5. Anybody can appear to conduct a case, not necessarily a qualified legal practitioner. The Warden is endowed with the power of a Supreme Court judge in many cases; but, being chosen for his tact, judgment and experience, he is enabled to check litigation and obviate expensive appeals. Had justice suffered under this "mild Cæsarian despotism," an outcry for a change would have undoubtedly arisen. The contrary has been the case; rich and poor, capital and labor, being satisfied with the machinery provided for maintaining their rights.

Throughout Australia the fostering care of the central Government is everywhere apparent. They build the roads, provide water supply, overcome the prohibitive veto of costly transportation for fuel, timber and supplies generally by building railways to promising centers—and this, not with a view to profit earning, but solely as an encouragement to the mining industry, carrying low-grade ore for 1 cent per ton per mile in some cases, recognizing always the economic truth that when $10 rock, scattered over a large area and hitherto irreducible at a profit, can be successfully treated for $8, then capital is forthcoming, population attracted and the latent element of a national wealth availed of to the utmost.

This policy of encouragement has been lately extended in a new direction with the happiest results, affording an object lesson in State socialism we may well afford to study here in the development of the New West. Two years ago the West Australian Government voted a quarter of a million dollars to be expended in the erection of public reduction plants in districts where indications showed capacity to support a population of diggers and small claim holders. Locations in plenty were held by individual miners who could neither sell nor raise funds to hold on and develop. In such centers mills were erected after careful inspection of auriferous possibilities by experts, the charges for treatment being fixed to cover cost of handling, of management and of providing for interest and sinking fund on the money borrowed by the Government under the grant. Last year nine batteries were successfully operating at an average charge of $2.75 per ton to the miner in a country where water and fuel are costly luxuries. They paid all the costs enumerated above and indirectly added thousands to the national treasury. The effect, in spite of many adverse predictions, was magical. Townships sprung up around the batteries and hundreds of useful citizens found profitable employment in operating ledges hitherto valueless. Another vote in expansion of the policy was granted by Parliament quite recently.

An example of the beneficial effects accruing from the erection of public reduction works may be seen in Shasta county, Cal., where the smelter of the Mountain Copper Co., Ltd., at Keswick, absorbs large quantities of low-grade quartz mined by small claim holders in the vicinity, who would otherwise be looking for work—supporting, in fact, a very considerable population of independent miners, and, by the exigencies of its own requirements for flux, doing it at a very cheap rate to its customers. There is room in the low-grade ore belts of California for half a dozen smelters erected in suitable localities, not for profit, but on the co-operative plan, with money advanced by the Government and operated on a scale of charges that will repay the loan in, say, thirty years, principal, interest and all intermediate expenses. It has not been found in Australia that the Government ownership of "public batteries" (custom mills) interferes in any way with capital seeking legitimate avenues of investment.

The foregoing is merely a sketch—a brief outline—of the general principles governing the industry in West Australia. The regulations which follow and form part of the mining Act in force cover every detail and are readily comprehensible to the digger of ordinary intelligence, so that he is enabled to fill out his own forms and transact his business without the aid of a lawyer or middleman. Active development is aimed at, so that the auriferous resources of the country may become national assets of practical, revenue-producing utility to all concerned.

To Users of Auger Bits.

TO THE EDITOR:—It frequently occurs that the operator bores a hole $\frac{1}{16}$ or $\frac{1}{8}$ too small for the bolt, or other purposes intended, and, naturally, the next move is to secure a bit the proper size and to rebore or ream out the hole; but nine times out of ten the bit will work its way through like a screw and not accomplish the desired effect. If the operator will reverse his stroke, i. e., turn backward instead of forward from the start, the same bit, if of the Russell Jennings pattern, will cut a clean, smooth hole.

Redding, Cal. WM. STEPHENS.

REGARDING the governing of turbines in a generating station at Davos, in Switzerland, there are four 200 H. P. turbines worked under a fall of 330 feet: if automatic governors were slipped under such a high fall, a sudden change of load would cause the gate of the turbine to shut very rapidly, and the sudden change of velocity of the water in the pipes would produce a shock, or excess of pressure, which is all the more dangerous the longer the pipes. In this case the pipes are 7200 feet long. To prevent the water hammer, there is a large air vessel about 4 feet in diameter and 40 feet high, connected with the main pipes, and also a special contrivance connected with the automatic governor, to open automatically the waste water valve and furnish an exit for the water as soon as the governor acted on the gates of the turbines. If the load is taken off suddenly, the normal speed of the dynamo does not change more than 4%, which appears satisfactory.

A California Gold Dredger.

Written for the MINING AND SCIENTIFIC PRESS by
R. H. POSTLETHWAITE

As dredging for gold is now coming into such prominence in this country, a brief description of the latest dredger on the Feather river, designed by the writer and built by the Risdon Iron Works for the Marigold Dredging Co., may be of interest.

This dredger is of the standard Risdon type of gold dredger, similar in principle to those already built, and described in the MINING AND SCIENTIFIC PRESS, but embodying many improvements and additions which have proved fully adapted to their various uses. The dredger will dig from a depth of 30 feet below the surface of the water and elevate the tailings to 30 feet above the water level, which will enable it to handle a bank at least 15 feet above water level.

The Marigold Dredger, Oroville, Cal.

The Marigold Dredger, Oroville, Cal,

The ladder consists of a heavy lattice girder with ½-inch side plates, 3 feet deep in the center and tapering off to 2½ feet at each end. The lower end carries a pentagonal cast steel tumbler and has a unique feature (protection for which is applied for) consisting of a strong stop or fender made of heavy plate and angle iron. The purpose of this is to get rid of the accident common to all continuous bucket machines, of the bucket belt occasionally leading off the lower tumbler, which, besides wasting time, is liable to cause serious damage. With this new stop, the bucket belt, when first starting to climb the flange, strikes the stop which is sufficiently strong to release the friction clutch. When this occurs all that is necessary to run the belt on again is to reverse the motor a few turns, which can be done in less than three minutes.

The ladder is provided with steel chafing rollers running against steel I beams built into the hull, which gives a smoother motion than the old style chafing beams, and reduces the wear and tear to a minimum. The belt travels upon cast steel rollers running in enclosed grease cup bearings, which system of lubrication is used for all parts subject to water and grit, and has proved very successful.

The bucket belt consists of thirty-two heavy, substantial buckets, each of a full 5 cubic feet capacity. These buckets have cast steel links bushed with manganese steel, and are heavily reinforced from the link some inches up the side. The lips, which are easily renewable, are made of a special grade of nickel steel which has undergone a special treatment to make it withstand the heavy blows, at the same time being hard so as to stand abrasion. The lips are 7 inches wide and 1 inch thick. The buckets are connected together with cast steel links and forged manganese pins. The top tumbler over which the belt travels is square, with renewable cast steel wearing strips, the design being very heavy and solid.

The main gantry, which carries the tumbler and countershafts, is of steel throughout and has proved absolutely rigid. This is one of the greatest improvements on the dredger, and the extra first cost will be far more than counterbalanced by its increased stability over the old style wooden gantries, especially in the Oroville district; however well timber is fitted, the excessive heat and dryness causes the joints to shrink, which necessitates constant tightening up of bolts, and even then bearings are apt to get out of line and cause trouble.

The main bucket belt is driven through a train of gears and one belt by induction motor of 50 H. P., taking a three-phase current at 1000 volts. The average horse power consumed, however, does not exceed 25 H. P., dumping twelve and one-half buckets per minute, which gives a capacity of approximately 150 cubic yards per hour. The material dumps into a steel delivery plate which conveys it into the revolving screen. Under the delivery plate are placed three sets of bar grizzlies which catch any drip there may be from the buckets.

The revolving screen is 4½ feet in diameter by 25 feet long, perforated with ⅜-inch diameter holes. The screen carries on its lower end a heavy cast steel ring; under this ring is a cast iron self-contained bedplate carrying friction rollers driven by steel bevel wheels, all bearings being brass bushed and having the end thrust taken up by fiber washers. The brasses are made interchangeable and reversible, to allow of the utmost amount of wear being taken out of them. The screen delivers the coarse material directly onto the stacker buckets, which are of the Risdon standard type, carried by steel I beams of sufficient length to elevate the material 30 feet above water level; both top and bottom tumblers are cast steel and five-sided. This elevator belt, instead of being driven from the top end by means of a rope transmission from the main shaft, is driven from the lower end by the same induction motor which drives the screen. Motion is conveyed from this motor to both the screen and elevator by means of a chain of gears carried by shafts running in babbitted bearings fitted onto a self-contained cast iron bedplate, which also carries the motor, thus insuring true alignment and pitch distance, which cannot be permanently secured where the several bearings are bolted onto timber.

The water supply is furnished by two centrifugal pumps, direct coupled, one on each side of an induction motor, one pump delivering 2000 gallons per minute into the screen through a perforated pipe, and the other supplying water into the distributing box and various save-all grizzlies. The pump takes about 30 H. P. to drive it, and owing to its construction does away with all troubles from belts. The gold and fine material passes through the perforations of the screen into the distributing box and over 300 square feet of standard Risdon tables which practically save all the gold. The sand and small gravel is then delivered behind the dredger by a sluiceway fitted with riffles. Under one sluice a sump is arranged from which a direct connected centrifugal sand pump takes the sand and some of the water and deposits it over the top of the tailings. This pump is lined with renewable liners and takes about 10 H. P. to drive it, and is only used very occasionally if a sand fill requires to be cut through.

The winches on this dredger show great advantages over those formerly used and are entirely new in design. The main winch is directly geared with steel gears to a 10 H. P. induction motor. The operating handles work in quadrants of locomotive type and are all brought to one platform, one handle for each of the four side-line drums. The design is such that the movement of one handle enables a drum to be instantly set in motion, allowed to run loose, or held by the brake; each drum is entirely independent and can be operated in any way regardless of the condition of the others, whether driven, loose or held. This prevents any delay in changing the position of the dredger, and, together with the independent ladder winch, will increase the actual capacity of the dredge probably 30% over the old style. The head line is operated by a slow-running drum, giving a steady but very powerful advance to the dredge. The ladder winch is entirely independent and consists of a 15 H. P. induction crane motor, fitted with brake and controller by which the ladder can be rapidly raised or lowered, the rope speed being 100 feet per minute.

The hull is very strongly framed and planked, 80 feet long by 30 feet wide and 7 feet deep, all the operating machinery being housed in. All gears are of cast steel and only one belt is used on the dredger, thus doing away with a fruitful cause of stoppage and annoyance, owing to the difficulty of getting belts and ropes to run well in the various changes of weather experienced. Current to operate the motors is conveyed on board by a three-core cable, braided together and well insulated. Each core is equivalent to No. 6 B. S. The supply is three-phase, 7200 alternations, 1000 volts. The large motors take this current at its full voltage through plunger type switches and the smaller motors through transformers which reduce the voltage to 400 volts, all switches being arranged on a convenient switchboard. The whole of the plant is of most substantial design, the ladder and buckets loaded weighing some thirty-five tons and the steel gantry some twenty-five tons. The actual average daily capacity of this dredger for the year will be some 2000 cubic yards bank measurement. The crew consists of two men per shift and the energy used about 70 H. P., and the daily cost of wages and energy for operating ought not to exceed $30 per day. The dredger has in the neighborhood of 200 tons of machinery on board, and costs about $50,000 in complete running order.

Platinum.

The platinum of commerce has been obtained entirely from alluvial deposits, although it has been reported in limited quantities in situ. About 80% of the present supply is derived from the alluvial deposits of the Ural mountains, but there are few, if any, of the gold-bearing gravel beds of the world that have failed to yield platinum, and it is more than likely that large quantities of platinum ore have been thrown away with the black sand washings from gold placer deposits. The distribution of platinum may be regarded as coexistent with gold placer deposits, as is evidenced by the list of localities, excepting Russia, that have yielded it in varying quantities. In California in nearly if not all of the gold-bearing gravel and sands; in Oregon, Georgia, Alaska on the Yukon river, Canada, British Columbia, Mexico, Colombia and Brazil, South America and Australia. The genesis of the native platinum is not well understood. In two cases the metal has been reported as found in quartz veins, but these reports have never been verified and are open to grave doubt. The undoubted occurrences of platinum in situ are in Russia, Brazil, New South Wales, Canada and Colombia. Platinum is usually found in the form of rounded or flattened grains of "sand," occasionally in irregular lumps of the size of peas; large nuggets are very rare—the largest as yet found weighing twenty-one pounds. The ore has a metallic luster and is distinguished by its steel-gray color, shining light gray streak when rubbed on a hard white surface, high specific gravity (16 to 19), malleability, infusibility in the hottest blast furnaces and not affected by borax or salt of phosphorus before the blowpipe, except in the finely divided state, when reaction for iron and copper may be obtained. It is soluble only in hot nitro-hydrochloric acid. The method generally adopted for extracting the ore is to pass the sand and water with gravel through puddling machines or revolving conical screens; the platinum and fine sand pass through into sluiceboxes beneath, while coarser materials are discharged at one side. The contents of the sluiceboxes are washed in the usual manner, and when gold is present in paying quantities it is removed by amalgamation with mercury, the platinum remaining behind. Experience shows that it is seldom profitable to work mines yielding less than three grams of platinum ore to the ton of gravel. The average yield of the richest Russian mines is about six grams per ton. Platinum has an affinity for iron, and is never without it. It alloys with copper, but is never found with it.

Large Storage Battery.

The Baltimore & Ohio Railroad has contracted for a huge storage battery to be used in hauling its trains through the Baltimore belt tunnel by electricity. This battery will consist of 320 tanks made of hard wood, lined with lead, each holding thirty-nine plates, nineteen negative and positive. Each tank will weigh, with plates and electrolyte, about 1800 pounds, and the complete battery will have a capacity of 1200 H. P. for a short period of time. The horse power of the electric locomotive ranges from 1000 to 1500, and this entire load has to be supplied by the power house at present. As the load is only required when the locomotive is in action, it is a spasmodic demand, the average use throughout the day being less than 500 H. P. When the battery is put into service, it will act as a reservoir of power, accumulating electricity while the locomotive is not in use, and relieving the power station of the load above the average by discharging into the line this accumulated current.

Jobbers and Manufacturers.

Eastern exchanges give considerable attention to a peculiar controversy between some San Francisco jobbing houses and the Selby Smelting & Lead Company as regards the handling of loaded shells, shot, lead pipe, sheet lead and other goods manufactured by the Selby Smelting & Lead Company at their cartridge factory and shot tower, which is one of the oldest institutions in California, and, because of its position as smelters and refiners of precious metals and low-grade ores, has a national reputation. In addition to smelting and refining the various ores and bullion, they are large dealers in tin, copper, zinc, antimony, etc. It has always been assumed that the Selby Smelting & Lead Company not only has the ability, but also the disposition, to be liberal; that they were specially anxious to protect all dealers against encroachments, thus endeavoring not only to promote local enterprises, but to make it to the interest of dealers to get their supplies in San Francisco.

The chief cause of the trouble appears to be that the jobbers complain that the Selby Smelting & Lead Company insists upon selling to certain San Francisco retailers and plumbers. The jobbers claim that, as manufacturers, the Selby Company should distribute their goods only through the jobbers. The latter have a combination—the Pacific Coast Hardware & Metal Association—whose first object is to promote good feeling and cordial relations among the different jobbing houses on the Pacific coast, and having in view definitely co-operation in endeavoring to secure better freight rates, and exercising such influence with the railroad and transportation companies as to protect them against the jobbing houses of the East. The association is now contesting with St. Louis and other jobbers before the Interstate Commerce Commission for better freight rates on less than carload lots from the East to the Pacific coast. Locally, however, some members of the Association have endeavored to exercise control over manufacturers declining to buy goods from any manufacturer who sells to retailers.

One of the difficulties is to know where to draw the line between jobbers and retailers. The general definition of what constitutes a jobber or wholesaler is a concern which sells more goods at wholesale than it does at retail. Some, in endeavoring to define the position more exactly, state that only a concern which sells at least 75% of its goods in whole packages should be considered a jobber. Many retail establishments do a large business, and will sell in any quantities they find best. Some of these houses have such great ability that they can handle goods to great advantage, and thus it seems inconsistent for certain jobbing houses to discriminate against such retailers. Reference to the customs in vogue among Eastern firms shows that they have had there the same difficulties to contend with, and that it is a positive rule with many manufacturers to establish schedules of prices on quantities, always favoring the larger dealer with a better percentage than the smaller dealer—schedules of prices being so arranged that the jobber, when buying in quantities, has such margin reserved to him by the manufacturer that he can sell the retailer at a reasonable profit. Where the business is managed with proper consideration for all interests, the jobbing houses are able to control the larger portion of the business; but there are some retailers who, having ability, are able to buy in quantities which seem to entitle them to more favorable terms than the ordinary retail concern, these houses having large capital deeming themselves entitled to consideration. The relations between the manufacturer and the dealer should always be amicable, co-operating on a basis whereby all the various interests may be harmonized, and in special localities work together in protecting their own industries.

Viewed from an impartial standpoint, it does not seem just that the jobber should claim to himself the right to dictate to the manufacturers how they should dispose of their products. On this line it has been the practice of some of the jobbers to base their margin of sales on the average yearly cost of doing business, and in some instances they have insisted upon charging the small retailer a price which would yield them from 17% to 25%, because they say it costs them from 15% to 17½% to do business. The large Eastern jobbers figure differently, and seem disposed to sell on a very close margin of from 2½% to 5%, calculating to turn over their money not less than six times every year; and at the rate of 2½% it is manifest that they have at the end of the year their 15%. These parties are jobbers; they aim to do business on a large scale, and to make their profit from the volume of business and frequent transactions, asserting that this is the better way. It is not wise to try to make the full measure of profit from each individual transaction.

The position of San Francisco, and the coast cities, is different now from what it was before the completion of the many railroads; the extremes of the country are coming closer together. Merchants and dealers on this coast should be satisfied with less margins on individual transactions, but aim to increase their profits by frequent transactions and larger volume of business. This can be done by adopting more liberal policy all round, and not attempting to oppress small dealers, or to inconvenience manufacturers. It seems to be the policy of the Selby Smelting & Lead Co. to adopt the same general plans as prevail in the East, by establishing such schedules as will protect the large dealer in a margin of profit, and also the small dealer against ruinous competition. It is not good business policy to ignore certain interests which it should be mutual pleasure, as it certainly would be ultimate profit, to conciliate.

The Selby Smelting & Lead Company use their shot tower as one of the channels for disposing of the lead produced at their refinery; they have also other channels open, and supply demand for their pig lead and manufactured materials from places tributary to San Francisco. They are able to compete with the East on this coast because the cost of lead in their ores and base bullion is purchased at prices corresponding with the Eastern cities; they have the advantage of freight from the East, and are enabled to distribute from this point in competition with Eastern manufacturers. They do not belong to the Trust. They have not sought to invade Eastern territory, and have reciprocal understandings with the various manufacturers in the East of their products, so that as a rule the Selby Company has not attempted to interfere with the trade of the Eastern manufacturers, and although at times they have a surplus of pig lead which could be manufactured and distributed to advantage, they have in good faith preferred to ship the pig lead to New York, and sold there rather than cause any disturbance.

It were better for mutual good that the contending parties get together and harmonize disputes to the end that all local interests be protected.

Shipping Molten Iron.

The construction of a new bridge across the Monongahela, Pa., directs attention to a striking feature of modern metallurgy. The usual way to make steel is to melt cold pig iron, to which other materials are added, and then purify the mixture by burning out certain undesirable elements. Pig iron, however, is itself the product of a previous heating process, in which the ore is melted up with carbonate of lime to remove the oxygen. It occurred to some ingenious metallurgist that if the product of the blast furnace could be converted into steel before it had cooled sensibly a great economy in fuel could be secured.

The bridge mentioned has been built for the Carnegie Co., and will be used to convey molten iron from the Carrie furnaces to the Homestead Steel Works, a mile away. At the present time Homestead obtains molten metal from Duquesne, 4½ miles away. The new route has been laid out so as to save time, distance and heat. There has been for some time one hot metal bridge across the Monongahela, controlled by the Carnegie Co., and, besides the new one about to be opened, a third is in process of erection for the Jones & McLaughlin interest.

One gets a vivid idea of this remarkable procedure when he reads about the precautions taken in the construction of the new bridge to prevent harm in case any melted metal leaks or slops over while in transit from the iron furnace to the steel works. The spaces between the ties are to be filled with sand, so that no iron may fall to the decks of passing steamers. The ties will be of wood, but are to be protected by a covering of sand. On either side of the track there will be raised a screen of heavy metal plates, faced with firebrick and reaching to the height of 4 feet. An extension of thinner plates will bring the screen up 6 feet farther. The cars are ladle-shaped and the molten metal runs directly into them when the furnaces are tapped. A locomotive then draws the train to the steel works at a moderate pace.

Broken Hill Sulphides.

A circular from Wm. Lidderdale, chairman of the Broken Hill Smelting Corporation, Australia, says:

"The directors have much pleasure in reporting to the shareholders that their process for treating mixed sulphide ores of lead, zinc, silver, etc., is now in complete operation at the Stanlow Works, Ellesmere Port. The process makes a full and satisfactory separation of the zinc from the lead, silver, gold, etc., and the recovery of metals, especially in silver and lead, promises to exceed the original estimates. On the ore already smelted the recovery of lead and silver is higher than was realized at the works at Llansamlet. The recovery of zinc has already reached upwards of 60%, and is improving. The directors have every reason to believe that the 70% originally promised will shortly be attained. In starting new works of every description some initial mechanical difficulties are invariably experienced before all the various parts of the plant work satisfactorily. This has been the case at Ellesmere Port, but the difficulties have been purely mechanical and not such as to affect the soundness of the process. Owing to this, and the very great rise in the value of coal and all other smelting materials, the working costs have hitherto been in excess of the estimate made at the beginning of 1898, but as important savings are being effected in sundry directions, your directors believe that eventually the working costs will exceed but little, if at all, the original estimates. The directors have no hesitation in assuring the shareholders that the important and difficult problem of treating mixed sulphide ores, which has created so much interest in metallurgical circles for years past, has been completely and satisfactorily solved by the process which is owned by the Smelting Corporation. During the last few weeks an inquiry has been received from a well-known and experienced smelter in the United States as to the directors' willingness to sell or lease the patent for that country, where large deposits of rich sulphide ores have been long awaiting a satisfactory process for their successful treatment."

New Metallurgical Process.

In the issue of Aug. 11, 1900, appeared an extended account of a new metallurgical process that attracted universal attention. In answer to numerous inquiries, it may be stated that the experiments there spoken of as carried out by Dr. Goldschmidt with aluminum as a reducing agent are now considered to have passed from the experimental stage. According to a paper read by Mr. Lange at the Paris meeting of the Iron & Steel Institute, the success of Dr. Goldschmidt's method is due to the fact that he found that the reducing mixture need not be heated from the outside; it is only necessary that the reaction be started, and this is done with the aid of a mixture of powdered aluminum and some peroxide, barium peroxide by preference. This mixture is now prepared by the Societe d'Electro Chimie, Paris, under the name of "alumino-thermie." For engineers there has been prepared a substance called "thermit," a preparation of iron oxide, Fe_2, O_3 and aluminum, its chief use being for repairs of large pieces which can not be heated in the ordinary way—such, for instance, as welding the ends of rails together, or replacing a tooth on a broken wheel. Assuming that a new tooth is the object sought, it is moulded in situ in fireclay, clay and coke, with or without the addition of sand. Then the required amount of "thermit" is melted in a special crucible, supplied by the company, one pound of the mixture giving one-half pound of iron. * * * *

To start the operation, a pound or two of "thermit" is placed in the crucible and some of the primer (aluminum and peroxide), about 1% of the mass, is strewn on this. Ignition is set up by throwing a lighted match on top of the primer or by dipping a red-hot iron wire into the mixture. The reaction starts suddenly. More "thermit" is strewn—not thrown—into the white-hot mass, until the desired weight has become molten. The temperature is estimated at 3000° C. The liquid corundum is poured off, and then the iron is poured into the mould. The piece is slowly cooled and the tooth hammered and filed down to the required dimensions. It would seem, however, that the process has achieved the greatest success in welding proper, for some test bars welded with thermit and shown at the meeting gave a strength of 36.8 kilogrammes, against 35.8 kilogrammes per square millimeter before treatment, and an elongation of 11.5% as against 15%. The tensile strength was thus impaired, but the fracture occurred some distance from the weld. To the boilermaker it will, however, perhaps be most interesting to note that tubes which have been welded endways with this process have withstood a pressure of 400 atmospheres, finally splitting lengthways when hammered or bent, but not breaking at the joints. Flanged tubes of this type would not have stood more than half the pressure, and the achievement is all the more noteworthy when it is considered that only the edges of the tubes are in contact.

Success Dependent Upon Success.

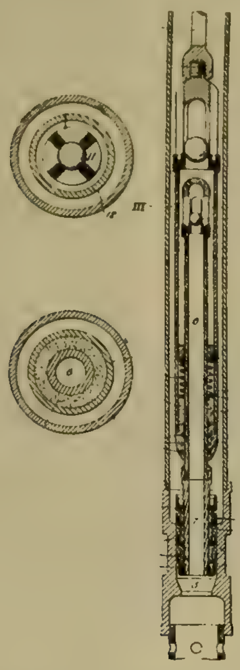
There is no other profession in the world so dependent for success on the smiles of Dame Fortune as that of mining. A lawyer counts but on himself to achieve position; a doctor earns honor by his own ability; but with the mine manager, fortune must be with him in his mine, and, even when so, success is only assured when followed by his own exertions, splendid organization, mining knowledge and management. No profession calls for men of hardier constitutions, pluckier hearts or of more intelligence, and to be successful in its ranks is to reach a goal which may well be envied by the rest of our fellow men. The life of a mine manager is a continual gamble. He is often expected to achieve results where there is no mine, and pay dividends where the most expert management can only meet expenses. The profession might well be called a lottery, which has, however, a big drag in favor of the bank, and, even when a prize is drawn in the shape of a good mine, it is only won after the years of study have been turned to such account as to make it a success, and that bigger than anticipated. No profession numbers in its ranks such a quantity of good fellows; the fortunate of one day are the unfortunate of the next; this tends to make men like each other for their qualities alone, and leaves a silken thread of good fellowship running through them which is the envy of all other professions and the pride of their own. The helping hand should be extended by the fortunate one of to-day to those of yesterday, or, let us hope, of to-morrow.—Machinery Register.

Mining and Metallurgical Patents.

Patents Issued December 4, 1900.

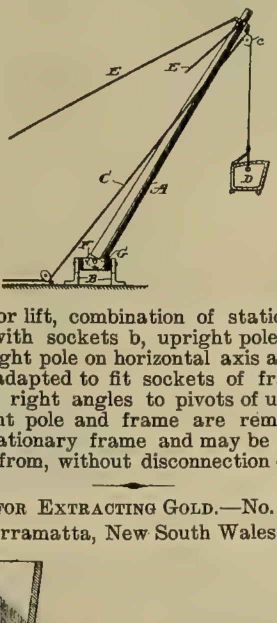
Specially Reported for the MINING AND SCIENTIFIC PRESS.

OIL WELL PUMP.—No. 663,029; J. Horsley, Glade Mills, Pa.



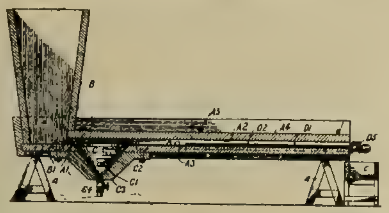
Combination of hollow stationary plunger provided at lower end with series of expansible packing rings with intervening separators and securing nut, adapted to be expanded by pressure of contained fluid and to be set in main tubing of well, check valve at upper end of stationary plunger with surrounding cage projecting outwardly beyond stationary plunger, outer inclosing section constituting reciprocating plunger provided with check valve at upper end mounted in cage, operating rod secured to top of cage by which reciprocating plunger is actuated, coupling connecting lower end of reciprocating plunger with downwardly extending packing chamber, coupling embracing stationary plunger and adapted to engage with cage of check valve of stationary plunger, an externally tapering terminal plug at extremity of packing chamber embracing stationary plunger and provided with internal annular packing rings, and compressible sponge packing, follower, and coiled spring surrounding stationary plunger and enclosed between coupling and terminal plug.

HOIST OR LIFT.—No. 663,109; B. Tucker, Philadelphia, Pa.



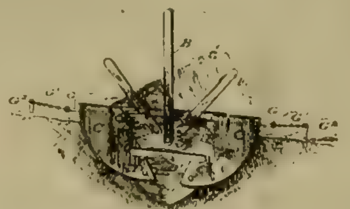
In a hoist or lift, combination of stationary frame B provided with sockets b, upright pole, frame pivoted to upright pole on horizontal axis and carrying trunnions g adapted to fit sockets of frame B and arranged at right angles to pivots of upright pole, where upright pole and frame are removably supported by stationary frame and may be removed together therefrom, without disconnection of parts.

MACHINE FOR EXTRACTING GOLD.—No. 663,375; G. Webster, Parramatta, New South Wales.



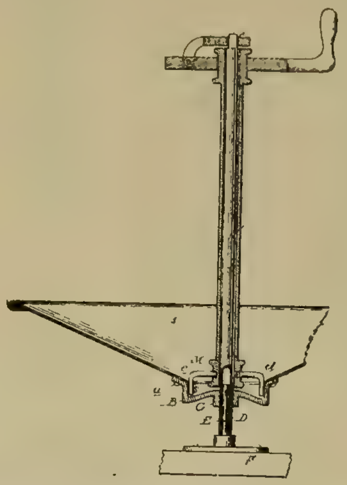
Combination of comparatively long, shallow covered-in passage or chamber having lining on bottom, hopper at one end thereof, conical catch receptacle or basin arranged at discharge end of hopper and having riffles arranged one in advance of other, toward delivery end of passage or chamber, a series of water pipes arranged to discharge jets of water, oppositely to flow of material through passage or chamber.

WATER STOP OR GATE.—No. 663,265; W. S. Fisher, Artman, Colo.



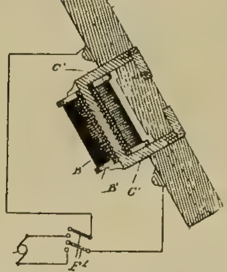
A water stop composed of main plate, extension wings pivoted thereto and movable on pivots whereby they may be projected beyond edges of main plate, levers for operating extension wings, levers being pivoted to main plate and connected with extension wings.

GOLD PAN.—No. 663,296; D. B. Newkirk, Detroit, Mich.



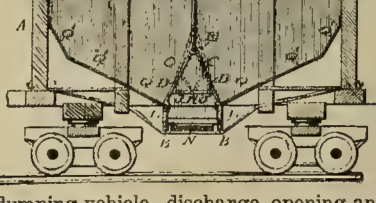
In a gold pan, combination with pan proper having formed centrally therein cylindrical depression or socket, standard to which pan is secured, tubular member sleeved upon standard for independent rotary movement, two sets of stirrer blades carried by tubular member at lower end, one set extending upwardly in proximity to pan and remaining set projecting downward into pan socket, handle for rotating tubular member, and link attached to handle and adapted to engage with standard.

MAGNETIC SEPARATOR.—No. 663,304; F. Theilengerdes, Memphis, Tenn.



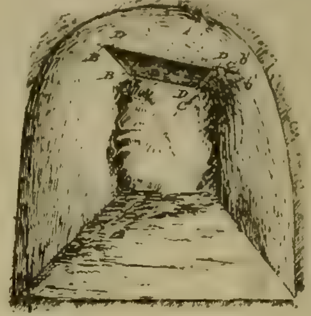
Combination with inclined hinged feed board, of flat electro-magnet core beneath and extending nearly from end to end of same, having broad ends turned upwards into slits in board, approximately parallel bars of magnetizable material sunk in upper surface of board, resting upon ends, non-conducting plates resting against upturned ends, oppositely extending lugs, coil wound about core between plates.

DUMPING CAR, ETC.—No. 663,310; I. L. Vansant, Philadelphia, Pa.



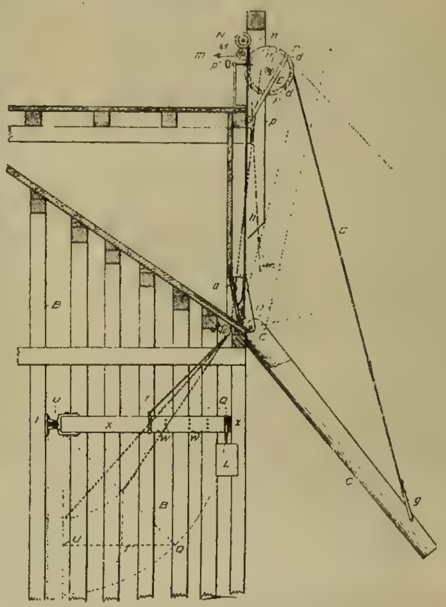
In a dumping vehicle, discharge opening and shutters therefor, top of walls of opening forming seat for shutters, formed of pair of diverging members jointed together at top, diverging downwardly, forming wedge-shaped structure, base convergible, means for raising and lowering shutters, toggle lever mounted on body of vehicle, connected with shutters for positively folding and unfolding latter.

AWNING FOR MINE SHAFTS OR TUNNELS.—No. 663,316; B. B. Wheeler, Apex, Colo.



Improved awning, comprising two sets extensible supports, each consisting of two parallel parts adapted to slide lengthwise on each other, means for clamping parts in any adjustment, and awning proper, applied to two sets of supports on opposite sides, whereby apparatus is adapted to be secured transversely in mines or tunnels having walls at different distances apart.

COUNTERBALANCED CHUTE.—No. 663,323; L. J. Anderson, Escanaba, Mich.



Combination of drum N, line V, with two strands of different lengths, door a, T-shaped lock lever pivoted at T-end, lock bolts F F, two strands of line being attached respectively to door and to lever O.

MIXTURE FOR SILVERING METALS.—No. 663,340; C. Gottig and W. Kottgen, Wilmersdorf, Germany.

Mixture for silvering metals comprising silver chloride, compound whose aqueous solution is capable of dissolving silver chloride, metallic chloride capable of yielding up chlorine and transferring same to any decomposition product formed from silver chloride under action of light and material which favors silvering action.

PROCESS OF MANUFACTURING METALLIC SILICIUM. No. 662,548; B. Scheid, Frankfort-on-the-Main, Germany.

Process of manufacturing crystallized silicon, mixing silicic acid, carbon and silicate of the alkalies, alkaline earths, or earths, and heating mixture to such temperature and under such conditions as to cause production of silicon and avoid its volatilization; formation of silicon carbon simultaneously therewith.

PROCESS OF MAKING ALUMINUM ALLOYS.—No. 662,952; L. Mach, Berlin, Germany.

Process of manufacture of workable aluminum alloy consisting in adding from two to ten parts of magnesium to every 100 parts of melted aluminum and then suddenly chilling alloy thus obtained.

THE Engineers' Club of San Francisco is a new organization in process of formation to include in its membership mechanical, civil, electrical and mining engineers and those allied with engineering projects.

THE Idaho Supreme Court this week decided that all patented mining property is subject to taxation.

Copper Dividends and Prices.

The Boston News Bureau gives figures as to the record of Michigan and Montana mines for 1900. The following table shows the total dividends paid in 1900 by some Lake Superior and Montana copper mining companies, with a 22-year comparison of the Lake Superior companies. The Calumet & Hecla has paid 71% of the total paid by all the Lake Superior companies during the past twenty-two years.

The total dividends paid this year by the Lake Superior companies were $9,795,000, of which the Calumet & Hecla contributed $7,000,000, and the total of the Montana mines for this year was $13,585,100, of which the Boston & Montana Co. paid $6,450,000, and the Anaconda $4,800,000.

	Per share. 1900.	Dividends in 1900.	Total paid to date.
Calumet & Hecla	$70	$7,000,000	$72,850,000
Boston & Montana	43	6,450,000	20,975,000
Anaconda	4	4.800,000	16,950,000
Parrot	6	1,335,100	4,370,323
Tamarack	17	1,020,000	7,290,000
Butte & Boston	5	1,000,000	1,000,000
Quincy	9	900.000	11,970,000
Osceola	9	558,000	3,652,000
Wolverine	4	240,000	510,000
Atlantic	2	80,000	360,000
Totals	$166	$23,383,100	$140,427,823

The following is a 22-year comparison of dividends paid by Lake Superior copper mines, average price of Lake copper and number of companies paying dividends (Montana mines' totals added):

	Average price Lake copper. Cents.	Total per share.	Total amount paid.
1900	*16.65	$108.00	$9,798,000
1899	16.76	129.00	12,318,000
1898	12.01	67.50	6,383,000
1897	11.33	62.00	5,431,000
1896	10.98	53.00	4,035,000
1895	10.73	53.50	3,280,000
1894	9.52	33.00	2,380,000
1893	10.75	47.00	3,520,000
1892	11.56	46.00	3,260,000
1891	12.76	48.00	3,540,000
1890	15.60	48.00	3,415,000
1889	13.49	45.00	2,670,000
1888	†16.78	52.50	3,260,000
1887	11.22	20.00	1,376,000
1886	10.59	26.00	1,900,000
1885	11.14	24.50	1,970,000
1884	13.73	21.75	1,327,500
1883	15.85	37.50	2,670,000
1882	18.41	44.50	2,850,000
1881	18.27	38.50	2,665,000
1880	20.18	48.50	3,070,000
1879	17.35	26.50	1,780,000

Total dividends Lake Superior copper mines for 22 years	$82,975,500
Calumet & Hecla's contribution (71%)	58,600,000
Balance other companies (29%)	24,298,500

Montana Mines—	Totals.
Boston & Montana	$20,975,000
Anaconda	16,950,000
Parrot	4,370,323
Butte & Boston	1,000,000
Total Montana mines	$43,295,323

* Estimated. † Year when French syndicate flourished.

Oil and Gas Yielding Formations of California.

NUMBER IV.—CONCLUDED.

During the early development of the Oil City field, much inconvenience was experienced through lack of water. In 1899, J. A. McClurg sunk two 275-foot wells in the valley land about 6 miles southwest of Oil City. The formation is: Drift to 200 feet, water-gravel to 212 feet, tough clay to 275 feet. The water rose about 5 feet in the casing. These wells yield an immense supply. Two 4-inch steam pumps are being used to pump the water into the receiving tank. A duplex Dow pump, having a capacity of more than 15,000 gallons in twelve hours, forces the water through 6 miles of 3-inch pipe to an elevation of 275 feet above the top of the wells. The oil field consumes about 15,000 barrels of water every twenty-four hours. This is potable water and rather hard. The output of water from the Oil City field during 1899 was 439,372 barrels. The oil is conveyed by pipe line from Oil City to Ora station on the S. P. R. R., a distance of 8½ miles.

The Alcalde field is about 3 miles southwest of Coalinga and extends from the old coal mines, which are about 4 miles a little west of north from Coalinga, to Alcalde creek. The petroleum claims on which prospect wells have been drilled are situated in the first two tiers of foothills which run in a southeasterly direction from the old coal mines. These foothills are for the most part formed of sandstone containing fossils of the Middle Neocene age. It is conceded that these Neocene rocks lie non-conformably on the Eocene, although the dip of the two formations is about the same. No white shale is seen between the Eocene and Middle Neocene formations in this locality except a slight outcrop near the San Joaquin coal mine. In 1893 the writer obtained a small collection of fossils from the San Joaquin and California coal mines, which demonstrates that the formations of these mines are of the Eocene age.

The outcropping rocks belonging to the Middle Neocene formations are principally sandstones with a little shale and conglomerate, the prevailing dip being about N. 70° E. Several brine and sulphur springs issue from this formation, and at one point there is a spring of tar-like oil. In 1893 the writer visited the San Joaquin coal mine (one of the old coal mines in this locality) and saw a small quantity of oil of medium gravity baled from one of the workings. There are no productive wells in the Alcalde district, but in August, 1900, ten prospect wells had been, or were being, drilled.

Atomic Weights of the Elements.

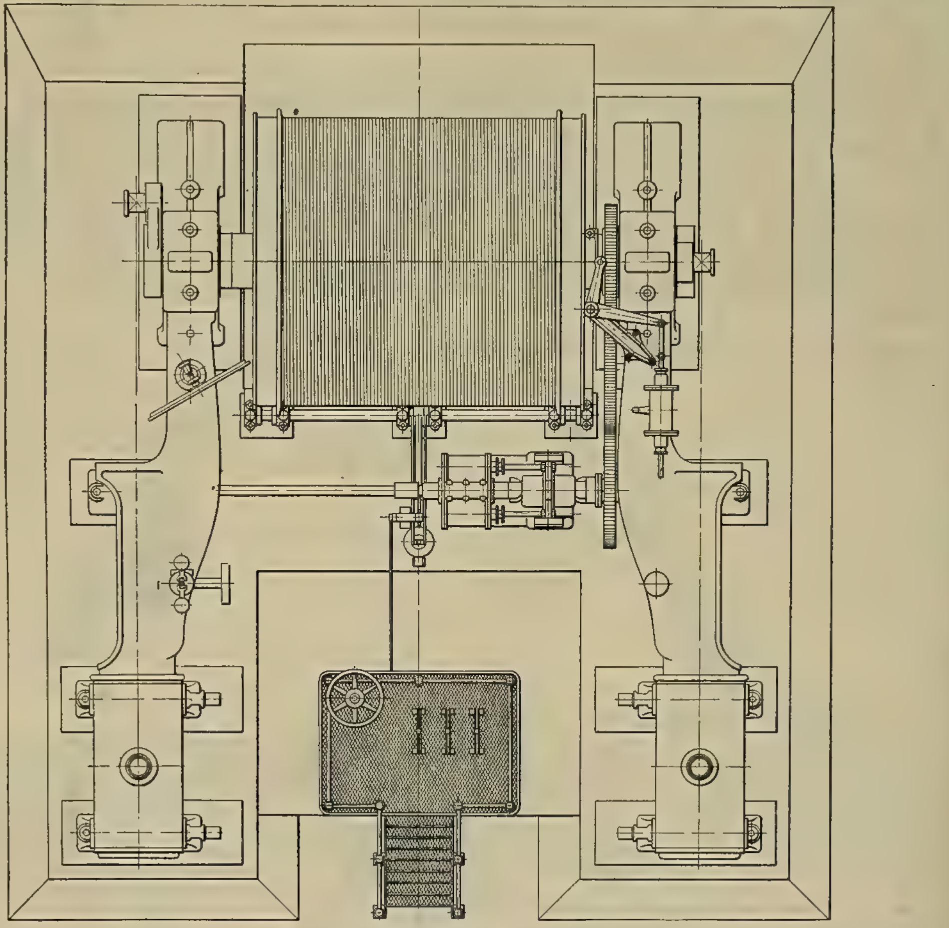
The special committee appointed by the German Chemical Society for the establishment of the atomic weights to be used in ordinary analytical work unanimously recommended the following. The weights adopted differ somewhat from those recommended by Dr. F. W. Clarke in this country:

Aluminum	Al.	27.1	27.11
Antimony	Sb.	120.0	120.43
Argon	A.	40.0	....
Arsenic	As.	75.0	75.00
Barium	Ba.	137.4	137.43
Beryllium (Glucinum)	Be.	9.1	9.08
Bismuth	Bi.	208.5	208.11
Boron	B.	11.0	10.95
Bromine	Br.	79.96	79.95
Cadmium	Cd.	112.0	111.95
Cæsium	Cs.	133.0	132.89
Calcium	Ca.	40.0	40.07
Carbon	C.	12.0	12.51
Cerium	Ce.	140.0	140.20
Chlorine	Cl.	35.45	35.54
Chromium	Cr.	52.1	52.15
Cobalt	Co.	59.0	58.93
Copper	Cu.	63.6	63.60
Erbium	Er.	19.0	19.06
Fluorine	F.	19.0	19.06
Gadolinium	Gd.	....	156.76
Gallium	Ga.	70.0	69.91
Germanium	Ge.	72.0	72.48
Gold	Au.	197.2	197.23
Helium	He.	4.0	....
Hydrogen	H.	1.01	1.008
Indium	In.	114.0	113.85
Iodine	I.	126.85	126.85
Iridium	Ir.	193.0	193.12
Iron	Fe.	56.0	56.02
Lanthanum	La.	138.0	138.64
Lead	Pb.	206.9	206.92
Lithium	Li.	7.03	7.03
Magnesium	Mg.	24.36	24 28
Manganese	Mg.	55.0	54.99
Mercury	Hg.	200.3	200.00
Molybdenum	Mo.	96.0	95.99
Neodidymium	Nd.	144.0	140.80
Nickel	Ni.	58.7	58.69
Niobium (Columbium)	Nb.	94.0	93.73
Nitrogen	N.	14.04	14.04
Osmium	Os.	191.0	190.99
Oxygen	O.	16.0	16.00
Palladium	Pd.	106.0	106.36
Phosphorus	P.	31.0	31.02
Platinum	Pt.	194.08	194.89
Potassium	K.	39.15	39.11
Praseodidymium	Pr.	140.0	143.60
Rhodium	Rh.	103.0	103.01
Rubidium	Rb.	85.4	85.43
Ruthenium	Ru.	101.7	101.68
Samarium	Sa.	150.0	150.26
Scandium	Sc.	44.1	44.12
Selenium	Se.	79.1	79.82
Silicium (Silicon)	Si.	27.4	28.40
Silver	Ag.	107.93	107.92
Sodium	Na.	23.05	23.05
Strontium	Sr.	87.6	87.61
Sulphur	S.	32.06	32.07
Tantalum	Ta.	183.0	182.24
Tellurium	Te.	127.0	127.40
Terbium	Tb.	....	160.00
Thallium	Tl.	204.1	204.15
Thorium	Th.	232.0	232.63
Thulium	Tm.	....	170.70
Titanium	Ti.	48.1	48.15
Tin	Sn.	118.5	119.05
Tungsten	W.	184.0	184.83
Uranium	U.	239.5	239.59
Vanadium	V.	57.2	51.38
Ytterbium	Yb.	173.0	173.10
Yttrium	Y.	89.0	89.02
Zinc	Zn.	65.4	65.41
Zirconium	Zr.	90.6	90.40

If hydrogen is taken as unity these weights have values different from the above, as, for instance, oxygen then becomes 15.88, carbon 11.92, iron 55.60, etc. For refined calculutions it is best to adopt the weights as recalculated by Dr. Clarke, but for all ordinary purposes the weights as given by the committee of the German Chemical Society can be used. Where large contracts are based on percentages of certain ingredients—as, for instance, chrome ore on the amount of acid, iron ore on the amount of metallic iron and the freedom from phosphorus, etc.—it is best to use the Clarke weights.

Direct-Acting Hoists.

In Colorado, California, Montana, Michigan and elsewhere the direct-acting or first-motion hoist is coming into use in many places where a high hoisting speed is required because of the depth of the shaft, or the magnitude of the output, the drum being mounted on the engine shaft, the latter being extra heavy to withstand the strain. The hoisting drum or drums are either keyed to the engine or connected thereto by clutches. An illustration of a single-drum hoist, as furnished by the Bullock Mfg. Co., 1170 W. Lake St., Chicago, appears herewith. This hoist may be arranged with the drum keyed to shaft and reversible engines, or with the drum loose on shaft and a band-friction clutch for driving. In this case the engine runs in one direction all the time, controlled by the governor and throttle. For hoisting, the clutch is tightened, connecting the drum with the driver; for lowering, the clutch is loose and the rope runs out, controlled by the brake. The hoists, as a rule, are supplied with steam and hand brake; steam reverse and steam clutch all operated from a raised platform.



Direct-Acting Hoist, Single Drum.

MINING SUMMARY.

ALASKA.

The 300-stamp mill at the Treadwell mines, on Douglas island, has resumed. ——Supt. Davis is finishing work on the Mexican.

The McKinley Creek M. Co., Porcupine district, will push work next spring.

The November report of the Alaska Mexican mine shows 14,264 tons ore crushed by 120 stamps in 29½ days, producing $22,580 in bullion and 245 tons sulphurets, valued at $4014—an average of $2 per ton; total yield, $28,538; expenses, $21,826.

The Alaska United mine shows in its November report 24,544 tons ore crushed by 220 stamps in 29½ days, $29,315 in bullion, 491 tons sulphurets, valued at $9914; gross yield for month, $42,963—an average of $1.75 per ton; expenses, $39,371.

ARIZONA.

GILA COUNTY.

No action has yet been taken upon the question of issuing the treasury stock of the Old Dominion Copper Mining Co.

GRAHAM COUNTY.

During November, the Arizona Cop. Co., Clifton, produced 910 short tons copper; the company is shipping bluestone to Italy. General Manager Colquhoun projects a tunnel into the mountain to carry off smoke from the smelters, reverberatories, etc.; A. Burke will run the tunnel on the Virginia Queen, in Greenlee district, now in 150 feet to 200-foot mark; Munday & Chase, owners.——Arbuckle & Schuman will run a tunnel on the Buckeye to connect with shaft.——Stewart, McAlpine & Lynch will sink a 100-foot shaft.

PIMA COUNTY.

The Helvetia M. Co.'s smelter, at Tucson, which cost $100,000, was destroyed by fire on the 7th inst.; it will be rebuilt.

Brichta & Cooper are developing copper-silver properties in the Tucson mountains, 14 miles northwest of Tucson.

S. W. Champion has made the last payment of $20,000 on the Tres Amigos, at Tucson. He is figuring on a 20-stamp mill, with power sufficient to increase to forty stamps. The 10-ton cyanide plant on the property will be enlarged.——A 14-foot body of ore is reported opened up on the 250-foot level of the Silver Trail, in Hassayampa district.

SANTA CRUZ COUNTY.

George Westinghouse of Pittsburg is locally credited with having bought the Buena Vista grant, 7000 acres, to erect on the Santa Cruz river a reduction works and smelter and build a railway connecting the mines, the reduction works and Nogales.

A new 25,000-gallon tank is in at the La Democrata, in La Cananea district; the new smelter will soon start up; Manager, L. G. Cloud.——The 20-stamp mill at the Grant-Chenoweth, near Nogales, is running steadily.

YAVAPAI COUNTY.

The Ventura Hill M. Co. is pushing work on its copper properties near Jerome.——The track in the Johnson will be removed to the Octave, at Octave.——A gold nugget, valued at $62.50, is reported found on Rich Hill recently.

The shaft on the Eugene, in Big Bug district, is down 80 feet.

The Prescott & Eastern Railroad Co. will build a line to the Great Belcher and Poland mines, in Big Bug district.

A 50-ton mill test run, made on the First Home, in Big Bug district, returned $37.65 per ton. The ore was taken from the 130-foot level.

YUMA COUNTY.

The new air compressor for the mill at Kofa will soon be in place.

The Papago Copper Co. is pushing work on its gold properties at Camp Dulce. A crosscut is being run on the 60-foot level. The shaft will be sunk an additional 100 feet.

CALIFORNIA.

AMADOR COUNTY.

The Keystone Co., at Amador City, is sinking a double-compartment shaft on an incline. A boiler and engine for hoisting are going in.——The Mitchell, 10-stamp mill, near Pine Grove, is running steadily. Ten additional stamps will be put in in the spring.

The shaft on the Peerless, Jackson, is down 500 feet.——The 900-foot tunnel on the Del Monte is completed. A new hoist will go in, and sinking continued to 500-foot level. T. Schenck, Supt. the Modoc is pushing work; shaft is down nearly 70 feet.

The Belmont, Pine Grove, owned by J. McKelvey, is closed down indefinitely. ——The lower lava tunnel on the Geo. A. Gritton, in Clapboard gulch, near Volcano, is in 1500 feet. ——Men are tunneling on the Martin-Christensen.——The 40-stamp mill of the Keystone, at Amador City, is being fitted with 4-foot concentrators, two to each five stamps; 1000 tons ore are crushed monthly; W. A. Pritchard Supt.

At the Baliol mines, Sutter Creek, W. H. Storms Supt., men are working in the 300, 400 and 500-foot levels. A new tramway from the mine to the mill is going in. ——The management of the Defender was changed recently.

At the Modoc, on Pioneer creek, 4 miles above Volcano, the tunnel has made connection with the shaft 377 feet in.——At the Shenandoah, near Plymouth, Supt. Thornton is getting the Ivanhoe mill in shape to run on ore from the Shenandoah.——Supt. McWayne is unwatering the Pocahontas, near Drytown.——Drifting is in progress on the 600-foot level of the Centennial. —— Unwatering of the Bay State, Plymouth, shaft is in progress.——Electric power is going in at the Oneida, Jackson, and it is said that twenty-five additional stamps will soon be dropping.——The shaft on the Fremont Consolidated, near Drytown, is down 400 feet. The shaft is three-compartment, 4′6″x5′1″, and is going down at an angle of 51°. Machinery from the old Gover shaft has been cleaned, repaired, etc., a new gallows-frame and engine house are up, and the shaft is repaired to a depth of 200 feet. A new pump is going in.——At Clinton G. A. Douet is pushing work on his mine.

BUTTE COUNTY.

The Spring Valley M. Co. at Cherokee will have 3500 feet 22-inch iron pipe made to carry water down to the monitors.

At Paradise the Campbell property, adjoining the Magalia, is reported sold to Mr. Stypher.

The new works for the Hesperian Crude Oil Co., at Cohasset, are up.——Boring for oil is in progress near the Wick ranch, near Oroville.

CALAVERAS COUNTY.

C. Weatherwax, Supt. Sunrise, at Railroad Flat, is pushing work; a new steam hoist will go in.——Work on the Paragon will resume.——The 10-stamp mill at the Del Monte, 5 miles from Railroad Flat, is running on good ore from the mine; the 900-foot tunnel has reached the shaft at a depth of 200 feet.——At the Mitchell, near Pine Grove, the 10-stamp mill is running steadily; a new Gates rock crusher is in place.——Under present plans the tunnel on the Tabeaud, belonging to the Standard Electric Co., will not be worked.——Operations on the Emerson, at Sport hill, near Mokelumne Hill, are resumed; water pipes are in and unwatering of shaft is in progress; Supt., L. K. Mau.——The new working shaft at the Birdena, Mokelumne Hill, is down 70 feet; the new hoist is about in, and sinking will soon begin.——A boiler, pump and other machinery are going in on the Golden West.——At the Santa Ysabel a hoist is in on No. 2 shaft; connections will be made with No. 1 shaft; mine has been unwatered and work will be pushed.——At the Dutch the ledge is reported opened up on the 1000-foot level; the cyanide plant may soon resume.——Sinking is in progress on the Lucky Boy, 3 miles south of San Andreas.——The Marshall, San Andreas, will resume.——An assessment of 3 cents per share is levied by the Ford M. Co.——The Mutual M. Co. is sinking a shaft on the Lucky Boy, Dry creek.——It is locally reported that the Thorpe, at Fourth Crossing, will resume.——Kiser & Nunes are reported to have recently opened up a good body of ore near Mokelumne Hill.——At the Tulloch, near Albany Flat, ore running $14 to the ton is reported opened up.

CONTRA COSTA COUNTY.

The California Powder Works has incorporated; place of business, Hercules; directors—J. Birmingham, Hercules; J. de Lavega, P. T. Morgan, H. T. Pillsbury, San Francisco; F. W. Van Sicklen, Alameda; capital stock $6,000,000, subscribed $2500.

EL DORADO COUNTY.

Work is being pushed on the Gopher-Boulder at Kelsey.——At the St. Clair, 2500 feet of water pipe is laid; a building has been erected over the mill, and ore is being mined.——The Eureka slate quarry has men working.

INYO COUNTY.

Wells, Fargo & Co. has sued the Ratcliff Consolidated Gold Mines for foreclosure of a mortgage on the mines, mill sites and water rights of the company. A balance of $16,982.50 is alleged to be due. M. Sheridan is appointed receiver.

Work on the Montezuma, near Big Pine, will be pushed; a rock crusher, roller mill and five concentrators will be put in near the dump; power will be furnished by a 40 H. P. engine; a 110-foot tunnel is run, tapping ledge 80 feet below the surface.——Mandeville, Fuller & Malone are pushing work on their nickel property near Black Rock.

KERN COUNTY.

The Coast Range Oil Co. has oil at 500 feet on 2, 32-24, near Bakersfield.——The Transfer Oil Co. has begun drilling.——The McKittrick Co. is putting a new derrick on well No. 2.——The Golden Rule has a new standard rig on 6, 10-23, near Sunset, and will begin drilling.——The Hawkeye State Oil Co. is down 200 feet on 18, 28-28.——Near Sunset there are thirty-five rigs drilling for oil.

LOS ANGELES COUNTY.

The Standard Oil Co. is reported to have acquired all the interests of the Pacific Coast Oil Co., paying therefor in the neighborhood of $1,000,000. The productive wells of the company embrace about forty, 7 miles from Newhall, varying in depth from 700 to 2000 feet, in sandstone and shale, the oil being piped 44 miles to Ventura; fifteen in Elsmere canyon, and three in Wiley canyon near Newhall, the gravity of the oil produced from the latter group being about 30° B. The total product of the Pacific Coast Oil Co. is about 150,000 barrels oil per year; gravity mostly 40° B. The company has a 13-still refinery at Alameda with a total capacity of 2215 barrels; tankage for 54,000 barrels crude and 12,000 barrels refined. It employs there thirty-two men; the products are mostly gasoline, illuminating and lubricating oils, distillates and asphaltum.

MADERA COUNTY.

Work on the Sunnyside, North Fork, will be pushed; new hoist and pump are in; miners receive $2.00 per day and board. ——Mullen & Rickard are running their arrastra on ore from Horseshoe Point.——F. Scott has men working in the King.——The Cameron is closed down for the winter.

MONO COUNTY.

The Crystal Lake M. Co., owning the Jackson and Lakeview mines at Lundy, is putting in a plant and will push work next spring.

NEVADA COUNTY.

The Mayflower, Nevada City, recently shipped two carloads sulphurets to the Selby Smelting and Lead Co., San Francisco.——Work at the 16 to 1, Washington, is progressing.

Sixty men were recently laid off at the North Star, Grass Valley, on account of shortage of water for power.——Supt. G. R. Tuttle of the Golden Gate reports opening up a 2-foot ledge of good milling ore in the 175-foot level. ——Ore is reported opened up on the Coe.

The Hudson, at Rough & Ready, is being unwatered prior to development work.

PLACER COUNTY.

A. Gorman is getting the Lady Walker, at Michigan Bluff, in shape for a run.——The Big Gun M. Co. will push work on the Big Gun next season.——W. Muir, Supt. of the Turkey Hill, is putting on men. The electric plant is in and the crushing mill will be running Jan. 1.

The tunnel at the Azalea drift, near Blue canyon, is in 2750 feet; an upraise will be run to tap the gravel channel; Blue Canyon M. & D. Co., owners; T. Rodgers, Supt.——The new tunnel on the Lloyd (quartz), on the American river, 4 miles east of Blue canyon, is in 250 feet; the tunnel was begun at a point 40 feet above high water mark; J. B. Knapp Supt.——D. P. Hocking has thirty men working on the undercurrent tunnel, North Fork of American river. —— Work at the Pioneer, Quartz canyon, is resumed; a tunnel is being run; twenty-one men are working under Supt. J. J. Sullivan.——N. B. Willey, Supt. the Red Stone (quartz) has five stamps dropping at present; more will be started up soon.

PLUMAS COUNTY.

The ledge in the Bluebell group, near Genesee, carries gold, silver and copper.

C. D. Hazzard is building a rock debris dam in Slate creek, below the Plumas Imperial, near Quincy; when completed, operations at the mine will be resumed.

RIVERSIDE COUNTY.

A. D. Hall, Supt. Riverside M, Co. which is operating mines 40 miles north of Salton, says that the company has a 125-foot ledge; it is the intention to put on double shifts of men.

SAN BENITO COUNTY.

The New Idria Quicksilver Co. has but one furnace, producing about 400 flasks per month. It secures all its ore from between the 200 and 400-foot levels. In a recent effort to determine the extent of its ore bodies a body of ore was opened up on the 700-foot level.

SAN BERNARDINO COUNTY.

The smelter of the Needles Smelting Co., at Needles, was started up on the 2nd inst.

The Nevada Con. M. & R. Co. is incorporated at San Bernardino; directors, R. F. Harrison, Los Angeles; S. T. Godbe, Salt Lake; F. Hison, A. H. Ham, J. L. Campbell, F. W. Gregg, San Bernardino; G. E. Otis, Redlands; capital stock $200,000, subscribed $4010.

SAN DIEGO COUNTY.

The Mars, Venus, San George and Goshen mines, near Picacho, are reported sold to Senator Jones of Nevada and others for $100,000. A 1000-ton cyanide plant will be put up.——A rotary drill is in use boring for oil on property near Encinitas.——The San Diego County Oil Co.'s well is down 670 feet.——The Monarch Oil Co. will use 5¼-inch casing in its well.——Drilling is progressing at the La Jolla, La Jolla. The well of the Lakeside Oil & Dev. Co., at Lakeside, is down 75 feet.

SHASTA COUNTY.

The Bunker Hill, near Middle Creek, three miles from Redding, is reported producing considerable gold at present.——The Central Pacific R. R. Co. recently made a gratuitous donation of $250 towards the sinking of the well of the Shasta Con. Oil Co., near Redding.——On the Miner's Dream, on the Shasta & Middletown road, a strike of a pocket of rich ore is reported made; $2000 were taken out in one day recently. The Ballaklalla has passed into possession of the Mountain Copper Co., Redding.——A strike is reported made on the Bunker Hill, on Middle creek.

A company will be organized to work the Red Cross (quicksilver), on Clover creek, in Mason mining district, 30 miles northeast from Redding.——Work on the new Trinity Copper Co.'s 500-ton smelter, 20 miles from Redding, may be started in January.——The Mammoth (copper), on Backbone, is reported bonded to M. Lindley for $125,000 for one year.——The Shasta Con. Oil Co. will begin drilling on Jan. 13th, it is said.——The Mount Shasta Oil & Development Co. will begin drilling in January in the Igo, Sands Flat and Stinking Canyon regions.

SIERRA COUNTY.

Spellenburg, Cook & Devine have men repairing the tunnel in the Bullion, Sierra City.——T. Higgins has leased the Mountain.——Work on the Chipps, leased to Castagna, Nelson and others, is being pushed.——Supt. W. Johns, Jr., is pushing work on the Sierra Buttes.

SISKIYOU COUNTY.

A cleanup from 11½ tons of ore from Hickey Bros.' claim on White gulch, in Liberty district, returned nearly $2000. ——Hathaway Bros., on Sugar creek, have closed down their arrastra for the winter. They will continue development work.——Supt. McKeene, of the Helena G. M. Co., Callahan, says operations will begin Jan. 1st.

The dredger in Yreka creek, at Hawkinsville, is running satisfactorily.

TRINITY COUNTY.

R. C. Wilson, Supt. of the Douglas D. & M. Co., at Douglas City, is pushing work on the ditch and flumes.

The Sikes M. Co. is to operate the old Bloss & McCleary, near Trinity Center. Hydraulic pipe gates, elbows, etc., are on the ground, and construction work will be pushed.

Construction of the new mill at the Headlight, near Carrville, is progressing.

TUOLUMNE COUNTY.

Smith Bros. are down 90 feet on the Fleming, near Quartz; they have put up a whim.——Operations at the Dutch are progressing. It is reported there will be considerable mining activity in and around Tuttletown next season.——At the Draper, Jamestown, a 10-stamp mill and a 10-inch Cornish pump are going in. ——Whitcomb & Boyle are pushing work on the McAlpin near the county line.

At the Santa Ysabel the station at the bottom of No. 1 shaft is completed, the air drills in position and crosscutting to vein begun. Low-grade ore has been found in the old workings on the second level near No. 2 shaft.

The Grand View G. M. Co., capital $250,000, is incorporated at Sonora; directors, C. W. Ayres, J. R. Schupham, M. A. Rothchild, F. M. Parcella, H. Gaytes.——The Stockton Gravel M. Co. is pushing work on the Philadelphia diggings, near Sonora.

YUBA COUNTY.

The Blue Point gravel mine at Smartsville will be worked. O. G. Sage of the Blue Gravel M. & M. Co. says he goes to New York City to interest the larger stockholders of the company in the proposition of building a restraining dam and the erection of machinery for hydraulicking and large capacity belt elevator, and to enlarge the capacity of the mill.

COLORADO.

BOULDER COUNTY.

The Star, Ward, will soon resume.——Men will be put on at the John Jay.——Work is progressing on the Ward Rose. ——Good ore is opened up in the drift on the Bloomer group.——The B. & M. mill is running steadily on ore from the B. & M.——The B. & M. Co. will build ore houses, 60,000 feet of lumber being already ordered.——Bemis & Sons are working the Rag Tag.——The shaft house on the Independence No. 3 is finished.——Sinking is progressing on the Superior.——A strike of tellurium was recently made in 600-foot level of the Ingram, at Salina, Manager Sauer. —— N. D. McKenzie, Manager Poorman (silver), at Eldora, has men putting machinery in shape to run; the Caribou tunnel will be reopened. The Poorman has not run since 1892.——The Native Silver, Manager McBeth, is being worked through the old "217" tunnel.

CLEAR CREEK COUNTY.

The shaft on the Alpha, Gilson gulch, will be sunk an additional 100 feet.——Work is progressing on the Trojan.——The shaft on the Freighter will be sunk to the 700-foot level; twenty men are employed.——The Veto is being cleaned out and put in shape for a run.——Work on the Grand Trunk, recently bought by Eastern parties, is being pushed.——The Amazon has resumed.——J. Manhire is pushing work on the East Santa Fe.——The Mayflower, near Idaho Springs, is reported sold to the Lord Byron M. Co., of Nebraska, for $60,000. The plant on this property consists of a 150 H. P. Corliss engine, two large boilers—60 and 80 H. P., respectively—hoisting apparatus, etc. Shaft is down 230 feet.——The shaft on the Lord Byron is down 500 feet.

The tunnel on the Silver Horn, on Ute creek, near Idaho Springs, is in 700 feet.——The Fraction shaft, now down 450 feet, will be sunk an additional 100 feet; manager, E. W. Redding.——The Mixsell will be equipped with a new 35 H. P. engine and 60 H. P. boiler.——The Allen mill, recently overhauled and enlarged to use German system of concentration, is now owned by Denver men, who will enlarge the plant; H. Strickland manager.——The Wilkie mill will be overhauled and changed to use German system of concentration.——A new 150-ton custom mill is projected for Idaho Springs.

DOLORES COUNTY.

The old Patrick concentrator, at Rico, will be remodeled and put in operation next year.——Wakeman & Hicks have driven the tunnel on the Golden Age over 1000 feet during the last year.——Byerrum & Rohde are pushing work on the Madame De Farge group, on C. H. C. hill.——The Meredith M. & M. Co. will remodel its plant at the mouth of the Horse gulch.——A sulphuric acid plant is projected at Rico; 500 tons of sulphide iron, at $1 per ton on the dump, are proffered the projectors.

Campbell & Webber will put on men and push work on the Atlantic Cable, near Rico.

EL PASO COUNTY.

The annual meeting of the stockholders of the Findley G. M. Co. was held in Colorado Springs on the 3rd inst. The treasurer's report showed that gross output to date for 1900 amounted to $81,174.91.——The Steelsmith shaft, now down 700 feet, will be sunk an additional 100 feet.

FREMONT COUNTY.

The Dorcas mill, at Florence, is running. During November, ore reduction of mills at Florence was as follows:

	Tons.
Metallic Extraction Co.	9,000
National Gold Extraction Co	3,800
El Paso	3,500
Total	16,300

It is reported that the Independent Oil Co. has struck oil on its property on the Wasmouth place, near Florence; supply is not sufficient for a pump, so sinking will be continued.——The United Oil Co. is drilling near Paradise.——Operations on the Smith & Cowan coal mines at Williamsburg are being pushed; a tunnel is driven; fifty men are employed. The Black Diamond Coal Co., operating near Silver Cliff, has opened up a 20-foot vein of bituminous coking coal. The quartz mines in this district are now using coal, hauled from Rockvale, costing $10 per ton. The new find will reduce prices.

GILPIN COUNTY.

(Special Correspondence).—The properties of the Gold Coin group, including the California, Hidden Treasure, Indiana and Kansas shafts, on Quartz hill, are to be started up under the management of P. McCann of Central City. Little work has been done on this group for two years. It is stated that the group will be operated under a new organization. The California shaft, which is 2250 feet deep, is in water up to the 1400 level. It will be unwatered.

A new hoist was recently put in at the Kansas-Burroughs, over the 1200-foot shaft. Shipments from this mine run about 3500 tons of ore per month.

The Gunnell is one of the heavy shippers of the camp. Its tonnage amounts to about 3500 per month. F. C. Young of Denver is manager.

Many of the old shafts near Central and Russell Gulch, which were idle for some time, are resuming work and the district generally is in active condition.

Central City, Dec. 8. WASCOTT.

Manager B. M. Myers of the Chicago Carr M. Co. is sinking a shaft on the Chicago Carr; a 30-inch streak of ore, opened up on the 115-foot level, runs from $78 to $204 to the ton; men are opening up leads east and west from shaft.——The Carr M. & Colo. Co., recently incorporated, has stripped, retimbered and enlarged its shaft for 550 feet; a new 100 H. P. double-engine hoisting plant is in, and sinking operations begin Jan. 1; three eight-hour shifts will be put on.——The new Vulcan hoister on the Phœnix-Burroughs, on Quartz hill, Manager P. McCann, is running; shaft, now down 1300 feet, will be sunk to 2000-foot level.

GUNNISON COUNTY.

Everything at the Silver Basin, near Pitkin, is reported to be ready for sinking operations.——Reynolds, Pearson & Ekbert, who have contract for driving the tunnel on the Gold Link an additional 100 feet, are in 60 feet.——Work on the Maid of Athens and Citizen mines, in Mineral Farm basin, is being pushed.

HINSDALE COUNTY.

A. A. McClurg, operating the General Sherman, near Lake City, is running an 800-foot tunnel, now in 500 feet.

HUERFANO COUNTY.

The Occidental Development Co. of Boston, Mass., operating coal and copper properties near La Veta, will probably put in a smelter at that point to treat copper ores.

LAKE COUNTY.

Twenty-five tons of ore from the Sunshine recently ran $50 to the ton.——Good ore from the 400-foot level of the Jenny Sample is being shipped.——The Princess Alice Co. has put in a small compressor on the Rubie; it has ordered a twenty-drill machine to be delivered Feb. 1st.——A new compressor is going in on the La Bella, making a total capacity at the plant for running sixty drills; this will be increased to ninety or more soon.——The main shaft on the Wild Horse will be sunk to the 1800-foot level.——The new hoisting plant at the Granite, on Battle mountain, is running.——The new power plant at the Loder, Leadville, is running; the two furnaces built by the Denver Engineering Works are in place, and they will be blown in as soon as the engine is in position; 500 tons of ore per day will be treated. A new 50x50-foot fine dust chamber will be built.——It is reported that $300 ore is opened up in the 800-foot level of the Vindicator; No. 1 shaft, now down 800 feet, will be sunk to the 1200-foot level, and No. 2 shaft, now down 2475 feet, will be sunk an additional 600 feet. Three shifts are working; output is 100 tons of ore per day.——The California gulch shaft is down 500 feet.

OURAY COUNTY.

On the Monument, at Ouray, the tunnel is in 400 feet.

SAN JUAN COUNTY.

The Woods Investment Co. has bought two groups on Bear mountain near Silverton, for $16,000. —— The Silver Lake group may be sold to the American Smelting & Refining for $2,500,000, it is said.

The new Kendrick-Gelder smelter at Silverton is running; W. F. Kendrick manager.——A 300-foot crosscut will be run on the Saratoga.——Work on the St. Paul will be pushed.

SUMMIT COUNTY.

On the Laurium, Breckenridge, the crosscut from the lower tunnel has cut the vein 148 feet in.——The old Country Boy tunnel, on the Juniata group, on Nigger hill, is being cleaned out and retimbered.——On the Gold Bug, in Galena gulch, the 15-stamp mill is running steadily.——Smith & Boyd will push work on the Germania. —— Etzler Bros. & Clyde, operating the Hardware, near Lincoln City, are building a shaft house over the 58-foot shaft; crosscutting is in progress on 58-foot level.——Work of sinking new shaft on the Johannesburg is progressing.——W. W. Boyd is pushing work on the Orthodox group, on Mineral hill.——An upraise from lower level of the Jessie is being run to connect with winze on the Seminole.——Whitehead & Nelson are sinking a shaft on the Teller, of the Little Dick group, in Gold Run.——The Cashier, T. L. Wood, manager, will resume soon, and work will be pushed during the winter.——Good ore is reported opened up on the Washington and Ohio properties.

TELLER COUNTY.

Manager Parfet of the Gold Exploration Co., which is driving the Ophelia tunnel, Cripple Creek, states that over 400 feet were driven during November; three shifts are working.——Lessee McCarthy is drifting in 200-foot level of the Nellie V.——Ore is opened up in twelfth level of the Isabella.——The St. Thomas Co. will build a shaft house and ore bins of 100 tons capacity on the Zoe and St. Thomas properties. They will also put in new hoisting machinery capable of sinking to a depth of 500 feet.——Russell, Ray & Co., newly organized, will work the Ray lease on the Minnie Bell; shaft, now down 400 feet, will be sunk to 500-foot level.——It is said that 7 feet of ore were recently opened up on 350-foot level of the Eclipse.——The Corinne G. M. Co. has received patents for the Undine Nos. 1, 2, 3, 4 and 5, and the Corinne, north of Tenderfoot hill, 38¼ acres in all.——The shaft on the Santa Rita, on Squaw mountain, is down 550 feet.

There was a crowded and stormy meeting of the stockholders of Stratton's Independence mine in London on the 7th. After hearing the report of the mine furnished by J. H. Hammond, the shareholders refused to pass on it, demanding a two months' adjournment pending the receipt of a report from the mine's engineers. A majority of the stockholders denounced the directors and left the meeting. After the majority had left, the poll was taken and it was found those present were not in favor of adjournment, so the report was adopted. The company has decided to declare a dividend for the quarter ending Dec. 31.

The main shaft of the Portland, Victor, is down 1000 feet; a station is being cut at this level; a 500-foot crosscut is run southeast of the shaft.——Ore is being shipped from the Unexpected, at Windy Point.——Walker and associates have sunk a 225-foot shaft on the Rigi, on Bull hill, Victor, and are crosscutting west on this level.——The Pueblo fraction, on Bull cliff, above the Maude Helena, is reported sold to the Free Coinage M. Co. for $26,000.——Johnson, Parkinson and others are stoping between second and third levels of the Coriolanus.

The Comanche Plume M. Co., owning eight acres land on Battle mountain, near Cripple Creek, will put in a new plant and sink a 600-foot shaft.——Ross & Hummer are shipping $50 and $100 ore from block 8 of the World's Fair.

The Orphan, Cripple Creek, is bonded to W. H. Spurgeon for three years for $275,000; bond calls for the sinking of a 4½x13½-foot three-compartment shaft, at the rate of 300 feet per year, or a total of 900 feet.

IDAHO.

BLAINE COUNTY.

Work on the Minnie Moore at Bradford will resume. Men are getting the pump in shape to clear the mine of water; thirty will eventually be employed.

BOISE COUNTY.

Work on the Confederate at Quartzburg is resumed. The shaft is down 250 feet.——H. L. Woodburn, assistant manager War Eagle, has bonded the property.——C. L. Clarke has leased placer ground on Clear creek.——Work on the Hidden Treasure, in Willow Creek district, 4 miles from Idaho City, is progressing. The shaft is down 40 feet.

ELMORE COUNTY.

The Idaho G. M. & M. Co. expects to begin operations on its property near Rocky Bar soon.——Operations on the Blackstone, in Volcano district, are closed down for the winter.——The Consolidated M. Co. may buy property near Neal, it is reported.

KOOTENAI COUNTY.

Supt. Heller is pushing work on the Lone Star, near Newport. A new hoist and a 45 H. P. boiler will be put in. A new compressor will be put in soon. The shaft, now down 138 feet, will be sunk an additional 200 feet. The tunnel is in 400 feet.

LATAH COUNTY.

The Elk Creek M. Co. of Moscow, capital $700, is incorporated to work placer property in Burnt Creek district.

OWYHEE COUNTY.

J. A. Purtill of Mountainhome, who is interested in placers on the Snake river, near Grand View, says that active operations will begin in February.

SHOSHONE COUNTY.

The Fannie Gremm M. Co., Ltd., of Mullan, capital $100,000, is incorporated to work the Fannie Gremm, near there.

The Cœur d'Alene M. Co. is operating a hydraulic elevator on Prichard creek placers, near Murray.

Work on the Lucky Friday, at Mullan, is resumed: a 400-foot tunnel is already run on the property.

MICHIGAN.

HOUGHTON COUNTY.

At Houghton the Trimountain M. Co. will put in a 40,000,000-gallon pump and other machinery necessary for the complete equipment of its stamp mill.

On the 25th ult. the last vessel to leave Houghton for the season took every bar of copper on hand at the Dollar Bay and Hancock smelters.

MONTANA.

CASCADE COUNTY.

Work on the A. M. Esler group, in Swift Current district, is progressing; the tunnel is in 400 feet and will be run 200 feet farther.

DEER LODGE COUNTY.

Cooney & Spriggs will put in a 10-stamp mill on a copper property 7 miles from Helmville.——Russell & Ogden have run a 250-foot tunnel on their property.

FLATHEAD COUNTY.

A tunnel is being driven on the Katie Fry (copper), near Leonia; it is expected to cut the vein at the 350-foot mark, which will give a depth of 450 feet from surface.

JEFFERSON COUNTY.

Ore shipments from the mines near Winston average 100 tons per week, returning about $50 to the ton; most of the ore goes to the East Helena smelter, 20 miles distant.——In the East Pacific stoping is in progress in No. 3 tunnel; No. 4 tunnel is in 3000 feet. New ore cars have been put in; F. Link Supt.——Smith & Jackson are shipping ore from the Stray Horse.——Kallock & Co. have bought the X Rays and will push work.——The Iron Age and the Stolen Sweets, in Iron Age gulch, are making regular shipments of ore.——Esler & Co. have their mine and mill in Granite belt, west of Beaver creek, running steadily; concentrates are shipped to East Helena.

LEWIS AND CLARKE COUNTY.

The Justice and Clementh mines, at Rimini, are shipping ore to the Peck concentrator at East Helena.——The shaft on the Belmont is completed; operations on mine and mill are being pushed.

MADISON COUNTY.

The Royal Potosi M. Co. of Butte, capital $300,000, is incorporated.

A twelve-day run of the 10-stamp mill on the Bowery, near Silver Star, Glass Bros. owners, returned $4100. Ten more stamps will be added; ten men are employed at present and more will be put on soon. Twenty tons ore are taken out daily; output will be increased after pumps are put in.——W. J. Miller will push work on the Uncle Sam, on upper Mill creek, near Sheridan, next year ——At Pony the Garnet mill is closed down, owing to lack of water; men are laid off and sinking is suspended; shaft is down 97 feet.——The Clipper-Boss Tweed is closed down for the present.——At Washington Bar, the Mohawk M. Co. of Tacoma, Wash., will drive its tunnel on the Bimetallic, now in 700 feet, to the 1000-foot mark, and then begin crosscutting.——It is stated that W. B. Holmes may suspend operations on the B. & L.——Work at the Madisonian is progressing.——A new boiler is going in on the Red Bluff.

W. Dickerson, manager of the dredger above Laurin, says that another large boat will be built this winter.——A strike is reported on the Sunbeam, on Indian creek.

SILVER BOW COUNTY.

The Boston & Montana, operating a diamond drill on the Leonard, Butte, recently developed ore running 30% copper on 300-foot level.

A. Livingstone has leased the Revenue mill at Jardine for three months; he also has an option on the plant, price being $50,000. He will put on twenty-five men and push work. Ore from the Robinson will supply the mill.

Work on the new ore tramway on Alaska street, Butte, is under way by Manager Wharton.

The Montana Ore Purchasing Co. will increase capacity of its reduction plant at Butte to 3,000,000 pounds of copper per month. Two new blast furnaces and four converters will go in. Most of the ore now treated comes from the Rarus, Nippur, Minnie Healey, Clinton and Homestake mines, and considerable from the Glengarry. The company is sinking a shaft on the Balm and one on the Cora.

The Polaris deal is off; the mine was recently reported sold to Donahue & Snyder of Salt Lake for $200,000.

NEVADA.

ELKO COUNTY.

The Dexter-Tuscarora mill at Tuscarora is treating 100 tons of ore daily.

HUMBOLDT COUNTY.

A 20-foot ledge of ore, running 12% copper, is reported on the Black Maria, near Steen's mountain.——Ore from this district is shipped by wagon to Winnemucca, and from there by rail to Salt Lake, Utah. Wagon freight to Winnemucca is $20 per ton.

LINCOLN COUNTY.

Bowen & Green closed their option on the Azurite mine, gold and copper, paying $5000 cash.

Hamilton & Wilkinson sold a prospect for $1000; Cook disposed of the Copperfiend, a Los Angeles man buying them for Eastern investors.

The Quartette Mining Co. of Searchlight will start their stamp mill this week.

Mining affairs are in prosperous condition at present, especially since prospect of the Salt Lake & Los Angeles R. R.

Campbell & Thomas' copper claim, Copper Chief, is at present under consideration on bond by Los Angeles people.

Goodsprings, Dec. 8.

A strike is reported made at north end of fourth level of the De Lamar mines at De Lamar.

NYE COUNTY.

It is said that ore from the Tonapah district, about 35 miles southwest of Belmont, runs $267.66 silver and $187.23 gold to the ton.

ORMSBY COUNTY.

It is reported that the Ophir Co. has bought the Bowie, on Cedar hill, near Carson, for $8000, and that a mill will be put in.

STOREY COUNTY.

On the 1800-foot level of the Con. California & Virginia, Virginia, the northeasterly drift from east crosscut No. 1 is in 370 feet. The main shaft is repaired. ——The tunnel in the Burning Moscow is in 162 feet. Forty-one tons of ore were shipped to the Selby Smelting & Lead Works, San Francisco, on the 8th inst. ——On the Mexican the west crosscut from a point 90 feet in from the mouth of north drift No. 2 is in 218 feet ——The Hale & Norcross tunnel is in 1902 feet.—— On the 220-foot level of the Sierra Nevada the northwest drift is cleaned out and timbered for 457 feet from the shaft.—— In the Chollar the upraise from the main north drift on the surface tunnel level is completed to the surface.——On the 80-foot level of the Greek shaft of the Potosi the south drift is out 102 feet.——The raise in the Holman tunnel of the Silver Hill is in 16 feet.——From stopes on the 325-foot level of the Gould & Curry 288 cars of ore, assaying $6.29 per ton, were extracted during the week ending Dec. 8. No. 6 crosscut on the 425-foot level of the Best & Belcher is stripped of rails, planks, timbers, etc.——Surface tunnel No. 2 of the Utah is in 770 feet.

WHITE PINE COUNTY.

Verzan & Garaghan are shipping ore from the Copper Queen to Salt Lake.

NEW MEXICO.

GRANT COUNTY.

The Santa Rita M. Co. is pushing work on its new three-compartment shaft on the Santa Rita at Santa Rita. A station is cut on the 300-foot level, and a drift to connect with 300-foot level of the Hearst and with the 250-foot level of the Aztec is being run.

JOSEPHINE COUNTY.

Supt. A. Howland is getting the C. & C., on Jump-off-Joe, near Grant's Pass, in shape to run.——The Sugar Pine, at Galice, is bonded to J. Harrington, representing Eastern men; a force will be put on and work pushed.——Kubli Bros., operating on Gall's creek, will push work during the winter.——Wright's new stamp mill is running steadily.

The Champion M. Co. will put in a gravity tramway on its property on Williams creek, near Williams.

OTERO COUNTY.

The Caballero Onyx M. Co. will push work on its onyx properties near Alamagordo.

SANTA FE COUNTY.

The mica properties of the Santa Fe Mica Co., at Nambe, are reported leased to O. H. Howarth of London, England, for seven months; he will spend $10,000 in development.

SOCORRO COUNTY.

Active operations are carried on in mines near Cooney. The Helen M. Co. is pushing work.

OREGON.

BAKER COUNTY.

The Gold Coin is reported sold to Milwaukee men for $10,000.——The shaft on the Simmons, in Cornucopia district, is down 300 feet; ore is hoisted by a whim. ——Supt. J. K. Romig, of the Sanger, near Baker City, has eleven men retimbering the old workings; a new pump will be put in.——Work will be pushed on the Black Bell, in Cracker Creek district. Forty-dollar ore was recently opened up on 300-foot level of the Bonanza, 20 miles from Sumpter; a 40-stamp mill is on the property.——The Blue Jacket, in the Seven Devils, has resumed; Supt., S. French.——It is reported that twenty stamps will be added to the mill at the Cornucopia mines, at Cornucopia, manager, A. Case; a cyanide plant is also to be put in. —— The 10-stamp mill on the Brazos, in Burnt River district, is running steadily; manager, R. Blewett.

GRANT COUNTY.

The machinery for the Badger, near Whitney, will soon be in. —The Liberty Bell Con. M. Co., capital $1,000,000, is incorporated to work the Hardware group, comprising the Hardware P. & B., Leviathan and Little Gertrude claims, in Alamo district. Work will be pushed during the winter.——On the Little Giant, the lower tunnel, now in 900 feet, is expected to tap the main ledge within the next 150 feet. The upper tunnel, now in 300 feet, has opened up a 12-foot body of ore. A new mill and electric light plant will be put in. A. G. Williams, manager, has twenty men working.——The Granite Creek G. Con. M. Co., capital $250,000, is incorporated.

SOUTH DAKOTA.

CUSTER COUNTY.

The Saginaw M. Co., owning property 8 miles from Custer, has begun operations on same; L. Hoyt, Supt.

LAWRENCE COUNTY.

Plans are on foot to make the Homestake, Lead, the largest gold producer in the country; a 200-stamp mill is projected, which will make a total of 1000 stamps at the mine, with crushing capacity of 4500 tons ore per day. The new pumping plant on the headwaters of Spearfish river is working successfully.

The Hidden Fortune, 1 mile north of Lead, is reported bonded to Chicago men. ——The Belt Extension Co., of Colorado Springs, is sinking a shaft in the Homestake lode, south of Lead.

J. D. Hardin will resume operations on property in Two Bit basin.

UTAH.

BEAVER COUNTY.

Work on the Adelia, in Star district, is progressing.

IRON COUNTY.

A strike of good ore is reported made on the Willowvale, in Stateline district; W. J. Dooley, Supt., has run a tunnel on the property.

A good body of ore is reported opened up on 50-foot level of the Sulphide, at Stateline.

JUAB COUNTY.

The new concentrator at the May Day, Tintic, will soon treat ores from the mine. ——The Clarissa is shipping ore.

MILLARD COUNTY.

Ore from the 135-foot level of the Copper Head runs about $60 to the ton.

SALT LAKE COUNTY.

A new dry process mill will be put in on the May Day, Salt Lake, by the Crown Gold Milling Co.——The Yampa, at Bingham, is reported sold to E. A. Wall, for $3000. —— Manager Channing reported good progress made on the new Highland Boy smelter, at Murray.

The Shawmut M. Co., in Bingham, will mortgage its property and offer to stockholders $50,000 5-year 7% bonds at 95; the proceeds to be used in payment of the company's floating debt and provide working capital.

TOOELE COUNTY.

Sinking is resumed on the Honerine at Stockton, Manager Scheu; a 160-foot tunnel will be run, and shipments of ore are expected to begin in Feb., 1901.

The Sharp M. Co. will push work on the Sharp, near the Honerine.

WASHINGTON.

FERRY COUNTY.

The Wanconda tunnel, Republic, now in 220 feet, is progressing at the rate of 3 feet per day; three shifts are working; timbers for 400 feet of the tunnel are ready to go in. Supt. G. L. Hedges thinks tunnel will strike the ledge within three months. The mill will not be erected until ledge is cut; it will be of 100 tons daily crushing capacity. The tunnel on the Unga, now in 350 feet, is expected to cut the ledge 540 feet from the portal at a depth of 250 feet from the surface; it is expected that tunnel will be completed by March 1. The Bodie M. Co., operating the Bodie, on Toroda creek, has day and night shifts working; shaft is down over 30 feet and work in tunnel is progressing. ——A tunnel is being driven on the Elk, near the Bodie.

The shaft on the California, Republic, now down 110 feet, will be sunk an additional 100 feet. A steam hoist will be put in soon, as horse whim is unable to take care of ore mined. Ore is shipped to the Granby, B. C., smelter.

The Clackamas G. M. Co. will push work on the Clackamas, Republic, under General Manager J. C. Kerley. Republic ores carrying silver can be treated as successfully at the Republic mill as those carrying gold.

The shaft on the Merrimac, Republic, is down 185 feet.——Drifting north and south on 90-foot level of the Hercules is in progress.——The winze of the Princess Maud is down nearly 300 feet below tunnel level.——Ore running $109 to the ton is reported opened up on the Chico.——The ledge on the Knob Hill is developed to a depth of 269 feet.——After a year's shutdown, the Madonna has resumed; S. Severson, Supt.

KITTITAS COUNTY.

At the Mammoth, in Slate Creek district, near Wenatchee, a new compressor, drills, 72 H. P. boiler and tracks are going in; the 5-stamp mill is closed down while improvements are being made.

OKANOGAN COUNTY.

The Wehe Con. M. & M. Co. will sink a 500-foot double-compartment shaft on its property near Weheville. Crosscuts will be run on the hundred-foot levels to cut the Buck Eye vein. Machinery will be put in and work pushed; E. C. Brown manager. —— The Milwaukee-Palmer Mountain G. & C. M. Co., J. Brechlin foreman, has four men working on its property on the Similkameen river. A 200-foot shaft will be sunk and crosscuts made at the hundred-foot levels.——The Milwaukee-Palmer Mountain G. & C. M. Co. will soon begin operations near Weheville.——Supt. Hammer is pushing work on the Milwaukee-Palmer Mountain M. Co.'s property.

The Palmer Mountain G. M. & Tunnel Co., Loomis, will put in a 55-drill compressor, a 3000 H. P. electric plant, and a 100-stamp mill.——Capacity of mill at the Golden Zone will be increased to seventy tons ore per day; new machinery is going in.——A 5-drill compressor is going in at the Puritan mines, on Gold hill; tunnel is in 1000 feet; a new 5000-foot tunnel will be started soon; a 100-stamp mill will be put in next year.——A new compressor will go in on the Six Eagles next spring; work is being pushed at the mine.——A large body of silver-lead ore is reported opened up on the King Solomon group.——The Bright Spot M. Co. will sink a 200-foot shaft.——A new 500-foot shaft will be sunk on the Wehe, Manager Brown.

In the Palmer Mountain tunnel, near Loomis, crosscutting is in progress at the 4000-foot mark. Ore is opened up that will net from $1 to $2.50 per ton.——The 500-foot tunnel on the Utica-Oro Fino is completed and crosscutting is being done. ——At the Puritan mines, work of putting in new compressor is under way; a tunnel is being run; fifty men are employed.——Good ore is reported opened up on the Bull Frog.——The new extra machinery and Huntington mills are going in on the Golden Zone, and it is thought that by Jan. 1st the 75-ton mill will be in operation. Work is progressing in No. 4 tunnel.——A plant will go in on the Six Eagles, on Little Mount Chapacca.——It is said that the Bridgeport M. & M. Co. will soon begin work on the Conconully.

A new $150,000 smelter, of 250 tons daily capacity, will be built in Methow district next spring by Eastern men.

SNOHOMISH COUNTY.

Work on the Blue Bird, at Darrington, is being pushed.——A strike is reported made on the Burns.——Operations on the Forest will resume.——On the Kickapoo, of the Elwell-Darrington Co., sixteen men are working; twenty-four more men will be put on soon.

SPOKANE COUNTY.

The Buffalo Star G. M. Co., capital $100,000, is incorporated at Spokane.

STEVENS COUNTY.

A new hoist is in on the Eagle, near Chewelah, and sinking operations will be pushed. Silver-lead ore was recently opened up on 200-foot level.——On the Nevada the shaft is down 80 feet; sinking is progressing. A concentrator will be put in in the spring, it is said.——The Juno M. Co. has two shifts sinking a winze from the Juno tunnel.

The United States Marble Co. has forty-four men working in the quarry at Valley. A new plant will go in.

WHITMAN COUNTY.

Supt. J. L. Harper has sunk shaft on the Hawkeye, near Rosalia, to 150-foot level, and is now crosscutting at that depth. Average assay of ore is $35.

WYOMING.

Last week G. Dane of Battle Lake denied the reported sale of his mine to U. P. officials for $250,000. This week he acknowledges that the sale has been made. He says it is worth more, but he has enough.

CARBON COUNTY.

The Kurtz-Chatterlin Co., operating copper mines near Grand Encampment, will increase capacity of its concentrating mill to 100 tons per day.——The Little Robert C. M. Co. will push work on the Little Robert. Ore carries copper glance assaying from 19% to 22% copper.

FOREIGN.

AUSTRALIA.

At the Gladstone, at Wandiligong, Victoria, 428 tons ore returned 523 ounces gold.——A 4-foot vein of good ore is reported opened up on 100-foot level of the Luck, Wood's point.

The annual report of the Department of Mines, New South Wales, for 1899 shows that the aggregate value of the mineral products of the colony to the end of 1899 was £134,064,712 4s 9d. The value of the mineral product for 1899 was £6,157,557 7s 6d, an excess of £1,290,559 10s 11d over the preceding year.

BRITISH COLUMBIA.

The Lorne, Woodchuck and Alhambra groups, Lillooet, were recently sold, the Alhambra bringing $150,000, the Woodchuck $75,000, and the Alhambra $30,000. ——The Bend Or, with 10-stamp mill, has a monthly output of from $4000 to $8000. ——The Con. Cariboo Hydraulic M. Co., Ltd., of Bullion, has closed down for the season. The third and last cleanup, after a run of twenty-eight days, returned $63,087. The first cleanup, made in August after a run of sixty-two days, amounted to $135,275; the second, after a sixty-eight days' run, produced $154,765, making a total of $353,127 for a run of 158 days.—— Ore is opened up on 130-foot level of the Tenderfoot, at Copper Creek, near Savona.

Work on the True Blue, Whitewater, is resumed; a station 30x30 feet will be cut in No. 2 tunnel, and winze, now down 40 feet, will be sunk to 190-foot level.

C. Parker, representing Montreal men, has bonded the Republic, near Nelson, for $30,000. Water power and timber are on the property.——The Le Roi Co., Rossland, will probably put in a 600 or 750 H. P. hoist, with speed of from 1500 to 2000 feet per minute, near the 1000 H. P. engine now going in.——The Velvet Co. may put up a smelter for the treatment of ores from that mine. Shipments of twenty-five tons ore daily are expected to begin Dec. 1st.——It is estimated that the season's output of the Cariboo, Cariboo, will be $350,000. J. B. Hobson, Supt.——Repairs to compressor plant at the Kootenay mines are completed, and work is resumed on 1000-foot level.——The Homestake tunnel is in 850 feet; driving is at rate of 5 or 6 feet per day.——Crosscut tunnel on 350-foot level of the Green Mountain is in 200 feet.——Work in the tunnel on the Wallingford, Rossland, is progressing, and vein is widening with development. —— On seventh and eighth levels at the War Eagle development is being pushed.——The shaft on the Spitzee is down 34 feet.——Timber framing and machine shops are nearing completion on the Center Star. —— On the Northern Belle, the crosscut tunnel is in 265 feet. ——During the month of October the Can. Pac. Ry. handled 34,000 tons ore from the mines of Kootenay and Boundary camps. ——A. Banks has men sinking a 20-foot shaft on his Perry creek placer ground, near Fort Steele.——The Kootenay Perry Creek Co. have sixteen men working.—— Work on the Golden Fleece, on Tracy creek, near Fort Steele, is resumed. W. Forsyth, Supt.——Five men are steadily employed on the Silver Belt group, Windermere. Shaft is down 30 feet.——The Paradise has twenty-five men working. ——The diamond drill boring on the White Bear, Rossland, is in 200 feet from north drift on 350-foot level. It is thought that another 150 feet will have to be driven before north end of the White Bear is reached.——The Lavina-Butte Co., operating on Hammel creek, near Kootenay, will ship silver-lead ore during the winter. —— The American Corporation, owning the Leiter, Wonder, and other properties on Sophie mountain, Rossland, will resume operations in the spring.——A meeting of the Rossland-Bonanza M. Co. was held in Rossland on the 1st inst.

After a shut-down of eight months, the Brooklyn, at Phœnix, has resumed; manager, J. Breen; Supt., J. L. Parker. A new smelter is projected.——Night and day shifts are driving tunnel on the Shiloh, at Ymir; another shift will be put on.—— The Granby smelter, blown in on Aug. 21st last, has treated 45,000 tons of ore in 108 working days, yielding 1650 tons of 50% matte; it is estimated that the yearly output of the smelter, at its daily capacity of 600 tons, will exceed $1,000,000.

MEXICO.

S. Merriman has bought a gold and copper property in Guaymas district, Sonora, for $6000; he is interested with Minneapolis men, and it is reported that they will push work on a large scale.——The Melczer M. Co., at Carbo, has 300 men working; the new smelter is going up; C. Spraker of Nogales, Ariz., Supt.—— The West Virginia Chemical Co. will open a sulphur mine 40 miles from San Luis Potosi. —— The Hidalgo M. & Exploration Co. is organized at Parral, with D. R. Hernandez as general manager.—— G. F. Peasley of El Paso will organize a company to work two copper claims near Oaxaca, Sonora.

Personal.

C. H. McIntosh of Rossland, B. C., is in Butte, Mont.

F. M. Taylor of Denver, Colo., is in Salt Lake, Utah.

N. J. Corbel Jr. of San Francisco is in Columbia, Cal.

F. Rainville is now foreman Draper mine, Jamestown, Cal.

D. M. Reardon of the General Electric Co. is in Clifton, Ariz.

F. L. Sizer of Butte, Mont., goes East, and from there to Mexico.

J. Gluyas is appointed foreman of the Erie, at Graniteville, Cal.

J. Dern has returned to Salt Lake, Utah, from San Francisco.

B. MacDonald, manager Le Roi, has returned to Rossland, B. C.

Ross E. Browne has returned to San Francisco from Nephi, Utah.

Supt. Chesnut, Hite's Cove, Mariposa Co., Cal., is in San Francisco.

N. S. Berry is examining property near Clifton, Ariz., for Eastern men.

Manager R. H. Britt of the Cumberland, Silver City, Idaho, has resigned.

W. Campbell is elected recorder Tintic mining district, Silver City, Utah.

Tingley S. Wood, of Leadville, Colo., lately returned from San Francisco, Cal.

F. M. Woods of the Woods Investment Co., Cripple Creek, Colo., is in Chicago, Ill.

G. S. Peyton of Stateline, Nev., will return there soon from Chicago and Denver.

D. E. Bigelow of the Union Iron Works, San Francisco, has gone to Cedros island.

R. A. Parker of the Centennial Eureka, Salt Lake, Utah, has returned to Boston.

Otto H. Tittman, of Missouri, is the new Supt. of the Coast and Geodetic Survey.

S. M. Irwin, traffic manager White Pass & Yukon route, has resigned his position.

C. G. Grim is appointed Supt. the Riverside, Columbia, Cal., vice G. W. Knox, resigned.

P. A. Wagner has returned to Coffee Creek, near Redding, Cal., from San Francisco.

Geo. H. Strong has returned to San Francisco from a trip extending as far east as Boston.

Supt. Stevenson of the Belmont, at Pine Grove, Cal., now closed down, has removed to San Francisco.

J. Boyd, Supt. and Gen. Mgr. Palmer Mountain G. M. & T. Co. of Loomis, Wash., is in Spokane, Wash.

H. Edlin, formerly Supt. War Eagle, Quartzburg, Idaho, goes to Sonora, Cal., as Supt. of the Virtue, near there.

Mr. Davey of London, England, who has been examining the Lezinsky group, near Clifton, Ariz., has gone East.

C. C. Bunker and D. F. Meiklejohn of Amador City, Cal., have returned there from San Francisco.

A. Buckbee of Salt Lake, Utah, is appointed manager of the Cumberland, Silver City, Idaho, vice H. R. Britt, resigned.

F. C. Anderson, representing Fraser & Chalmers of Chicago, Ill., is superintending construction of the new Medler smelter, 3 miles below Clifton, Ariz.

Geo. E. Price, who has been managing mining concessions in the Dutch Guianas for some time past, is on his road home, returning by way of London. Mr. Price writes that is no country for American miners to go to.

Thomas Couch of Montana and California fame has returned to San Francisco from examining mining property in Trinity and Humboldt counties, Cal. He says the properties themselves are all right, but they are almost inaccessible, and that while he is tolerably familiar with bad roads he never saw such poor apologies for roads anywhere as on his recent trip, and that while the lower Trinity region is rich in mineral wealth its inaccessibility is a serious drawback to its development.

H. C. Hoover left San Francisco this week on his return to China, where he has charge of some mining operations. He says that it is not because of any superstition that Chinese are averse to English or American or German mine operators; he says they fully understand and appreciate the value of their mines, but want to keep the product for themselves; and that, as a matter of fact, the Chinese were mining in King Solomon's time and before that as far back as in the reign of Emperor Yu, about 2500 B. C., when commissioners were appointed to examine the mining resources of the country in gold, silver and cinnabar. Doubtless in those days, 4400 years ago, those mining commissioners were classed as mining experts, and probably gave testimony as to extralateral rights, side lines, end lines, etc. Mr. Hoover says throughout the northern Chinese provinces are found everywhere little mounds which when being uncovered are found to be debris of ancient mines, which went down on the oxidized ore till sulphurets or water were encountered, when the operations stopped. He thinks the Chinese a probable field for the American mining engineer, but not an immediately available proposition.

N. W. Beecher of Sydney, Australia, wholesale hardware merchant and importer of iron and steel supplies and tools, says that since the establishment of the steamship line direct from San Francisco to Sydney American products are fast finding a market in Australia, and in some instances they have crowded out English-made goods entirely. "We have begun to irrigate arid land by means of artesian wells, the casing for which is nearly all being purchased in the United States. We are also buying gold mining machinery and general hardware here."

Commercial Paragraphs.

Stephen Rickard is now located at 1727 Stout St., Denver, Colo., in his new assay office.

The Denver branch of the Sullivan Machinery Co. has been moved into more commodious quarters at 431 Seventeenth St.

Tatum & Bowen of Portland, Or., recently furnished the Gold Ridge at Baker City with a 620-gallon, double-acting, duplex, compound sinking pump and an 80 H. P. boiler.

The Canton Steel Co., of Canton, Ohio, have issued a neat little book giving points on mine steel, tempering, etc., and testimonials from pleased customers. It will be sent free upon application to P. P. Bush, 1601 Seventeenth St., Denver, Colo.

M. R. Muckle Jr. & Co., the Philadelphia representatives of Messrs. Westinghouse, Church, Kerr & Co., have removed to their new office, No. 512 Stephen Girard building, No. 21 South Twelfth street, Philadelphia, Pa.

The Crown Gold Milling Co. of San Francisco, Cal., through its president, A. J. Harrell, signed a contract Dec. 7th with F. A. Flindt and S. W. Mosby, lessees of the May Day mine, Tintic, Utah, by which it agrees to install a Crown gold dry concentrating plant, of eighty tons per day capacity, within ninety days from date.

The Paris agent of the Rand Drill Co. reports that all the compressors and drills which were on exhibition at the Exposition have been sold. The large Corliss compound compressor at Vincennes was purchased by the firm of Messrs. J. & A. Niclausse, manufacturers of Niclausse water tube boilers, by whom it is to be used for the operation of pneumatic tools. This is the compressor which supplied the compressed air to all the American exhibits at Vincennes.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Separators and Amalgamators.—No. 662,685. Nov. 27, 1900. Ira P. Clarke, Alameda, Cal. This invention relates to an apparatus for separating coarse and fine pulverized material containing valuable metals, with the object of reducing the bulk of the ore-carrying sand to the smallest degree, and to then deliver the graded materials upon separate amalgamating tables or surfaces. It consists of superposed tables, means including convergent shafts and crank pins carried thereby and connected with the tables, whereby the latter are given an oscillatory and gyratory movement. There are chutes through which material is delivered upon both tables, and shaking screens located above the chutes are adapted to separate and grade the material and deliver it independently into the chutes.

Floors, Sidewalks or the Like.—No. 662,597. Nov. 27, 1900. P. H. Jackson, San Francisco, Cal. This invention relates to improvements in fire-proof floors, roofs, sidewalks forming roofs to vaults or rooms beneath, also walls and the like. Its object is to provide an inexpensive fire-proof roof, floor, wall or like construction to resist tensile or lateral pressure. It consists in the combination in a floor, roof, wall or like structure which is subjected to weight or pressure from one side, of cement or concrete forming a body. Plates of sheet metal are embedded in this body, said plates having rectangular openings with the sides parallel with the edges of the sheets and upturned walls surround the openings. The edges of contiguous sheets are overlapped, and the projecting walls of a line of openings of one sheet enter the openings of the other, said walls being afterward folded or interlocked.

Steam Boiler Crown Bar.—No. 663,064. Dec. 4, 1900. Edwin Clay, Wadsworth, Nev. This invention relates to devices for bracing and supporting the crown sheet of steam boiler furnaces. It consists of parallel vertically disposed plates with integral transverse connecting ribs and end plates fitting and adapted to be secured to the exterior shell of the boiler above the crown sheet. Stay rods are pivotally secured at both ends and connect the arch of the boiler with the crown bars intermediate of their length, and bolts pass through the crown sheet and into the transverse ribs of the crown bars.

Bicycle Brake.—No. 663,297. Dec. 4, 1900. A. H. Nield, Coutolenc, Cal., one-half assigned to P. M. Ream of Lovelock, Cal. This invention relates to a brake for bicycles, automobiles, or other vehicles to which such a structure may be applied. It consists of a two part bushing and a corresponding inclosing sleeve with means for clamping them upon the hub interior to the wheel spokes. An annular rim is located exterior to said wheel spokes, with arms extending from the sleeve outwardly, and to this arm the rim is fixed. A pair of fulcrumed levers closable toward each other has shoes adapted to clamp the rim between them, and there is mechanism for actuating said levers.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

Train Lighting From Car Axle.

Electricity has added much to the comfort, convenience and safety of modern railway travel. Among such latest contributions is a system of lighting by which each car in a train has its own independent lighting apparatus. A dynamo is placed beneath each car and the rotation of the car axle supplies light. The dynamo is so adjusted that at a speed of fifteen miles an hour it feeds the lamps direct, the superfluous current being stored in a battery for use when the car is stationary. The dynamo maintains a pressure of from thirty-two to forty volts, and is automatically switched into circuit when the speed of the train is fifteen miles an hour, the pressure being so controlled that at all speeds the current supplied to the lamps is uniform. When the car is at rest, and the switch box has switched the dynamo out of circuit, the lights are supplied at thirty volts by the storage batteries. After starting, as the car gains speed the dynamo voltage is built up until it has reached a potential above that of the storage battery and the lamps. The latter are prevented from receiving more than thirty volts by means of resistance in their circuit. The lamps are of sixteen candle power ; the filament is a short, stumpy one, not affected by vibration and consequently long lived.

In transmitting the power from the car axle to the dynamo a flexible frictional gearing is used. In the use of a dynamo in connection with a storage battery the polarity of the dynamo must always correspond with the polarity of the battery. To keep the polarity of the dynamo uniform with the batteries a mechanical device is used, actuated by the armature shaft, which operates to throw a switch when a change in the direction of the movement of the car takes place.

The control of the dynamo at all speeds, so that at a high speed the current will remain normal, is accomplished by the use of a small motor that operates when the dynamo is generating, and, with suitable mechanism, throws resistance in and out of the field coils of the dynamo as the speed increases or diminishes. When the dynamo is charging the storage battery the electromotive force of the battery raises, so that without some method of control the electromotive force would be too high on the lamps. This system maintains a constant electromotive force on the lamps by means of a resistance thrown in the lamp circuit in proportion to the amount of current generated in the machine. The accompanying engraving illustrates and explains the operation. The system is supplied by the Consolidated Lighting & Equipment Co., 120 Liberty St., New York City.

CONTEMPORANEOUS comment on the remarkable closeness in the bids on a recent big contract sees in such evidence of collusion and an understanding between the bidders. It does not seem so to us. Knowing that the bids were put in under every condition of genuine competition the incident from our standpoint affords illustration of the exactitude now reached in great manufacturing establishments, and the precise knowledge that enables such concerns to figure so closely on every detail of a large contract, so that when the aggregate of each bid is published the proffers vary very little. In a recent bid for installation of a municipal electric light plant three electrical concerns, each desirous of getting the work, and in genuine competition, bid as follows: $36,031, $35,874.05, $36,865. Under such circumstances the closeness of the bids indicates entire absence of guesswork and exact and detailed knowledge on the part of the bidders of the cost of every item in the proposed work.

IT is not fair, as an Eastern exchange of some standing does this week, to so strongly condemn the mining stock exchanges, or to single out for particular denunciation the bear therein. The effort of the bear to depress prices for the purpose of making money on the decline, is no less reprehensible than the effort of the bull to inflate them that he may make money on the rise. But if the manipulations of both the bulls and the bears were eliminated from any mining stock exchange it would be lifeless. It is within the limits of argument to admit that the death of a mining stock exchange would not wholly discourage legitimate mining, but yet, mining stock investments constitute a certain form of mining, for the buyer of such stocks becomes an owner in the property. It was because of such buying and selling that the biggest and boldest mining development in this country up to that time ever became a possibility. We refer to the Comstock, Nevada, in its bonanza days. Anything that will encourage legitimate mining should be encouraged; anything which tends to discourage it should be discouraged by mining men; but till it is made clear to us that the buying and selling of stock in other business combinations is all right, while such buying and selling of mining stock is all wrong, we fail to find the fine distinction that commends trading in industrials, but condemns trading in stocks of equal value and greater possibilities of profit just because they happen to be mining stocks.

Treatment of Silver-Lead Ores.

In the issue of the 17th ult. was given some discussion of the concentration of silver-lead ores in answer to a question from a Colorado miner, who wrote saying: "The ore is galena, carrying gray copper, which in turn seems to carry the silver. The gangue matter is heavy spar, or barytes. Analysis shows the ore to run: Silver, 19 ounces; lead, 13.7%; silica, 43.9; $BaSO_4$, 23.9. In order to effect separation from the barytes we have found it necessary to grind to 40 mesh. By doing this and concentrating at the rate of 4.25 to 1 we save 99% of the lead, but our tailings assay 17.50 ounces silver. The gray copper and the barytes seem to pass off together. Our neighbors, who have quartz instead of barytes, have the same difficulty in attempting to save the silver."

Like so many other metallurgical matters discussed herein, the problem proffered and the answer thereto have been the subject of several letters, and the way the matter is so discussed is illustrative of how those things appear from different points of view. Three of the letters take the subject up in an off-hand way and airily dispose of it as a small question easily answered. Those letters are apparently from men who believe what they say, but who have not given the subject much consideration.

Noticeably different is the style of comment from men who have made such things the study of their lives. One Colorado miner of prominence, who has grown gray in the practical consideration of such questions, writes from the standpoint of intelligent experience as follows:

"It is very rare indeed that one gets an ore that can be perfectly treated on the ground by one class of treatment. More particularly is this true in concentration. It seems as though the only all around process is that by smelting. No matter how perfect a sulphide an ore may appear to be, I have rarely seen an ore that had not been subject to slight oxidation, and, unfortunately, it seems to be the rule that silver will oxidize a little quicker than any other metal. We know that if zinc and lead are placed together, subject to oxidizing influences, the zinc will oxidize before the galena does. The silver in the ore goes into so many forms that are partially or entirely soluble in water, even in the ores, that seem as though they were ideal for concentration. Of course, we all know that a carbonate and an oxide are very difficult to concentrate and save the values, and, of course, a chloride is practically impossible. I have found some difficulty in making tests on many gold ores. Up to 60% the saving is very close indeed, and beyond that you have to fight it for each per cent. Very often in such cases I have found that the ores carry tellurides of silver and gold, and this undoubtedly accounts for the loss.

"As an instance, I express to you a shovel used in one of the mills here in every day work for shoveling concentrates. You will find, first, that the iron has been replaced by the lead, and then the lead and iron are both being gradually replaced by silver. This is true not alone of this one shovel, but is true of all those that we ever used, and our ore is in many respects a very excellent concentrating ore.

"The general rule when a man makes heavy losses is to explain everything by saying, 'Oh, that goes off in the slimes; can't be saved.' It is a very serious question with me whether that is true or not, and in some instances I absolutely know that it is not true.

"The silver, through this partial oxidation caused by air and water, or by some acid in the ore, absolutely goes into solution in the water.

"The first question, when a double treatment is spoken of, that is usually asked is: 'Well, why not concentrate first and then cyanide or chlorinate the material that carries the values?' I think that in certain instances this might be advisable, but if even part of that stated above is true it is not always advisable. In fact, the more I test ores the more I find that each one must be handled separately. Of course, the ore that your Colorado correspondent describes is theoretically a smelting ore, but I can readily understand that under certain conditions, such as distance from market and other things that might influence one, the ore would be worthless unless it could be treated upon the ground, and I believe that in such cases a double treatment is necessary. Whether it be by cyaniding or any other similar agent, selective in its action upon the precious metals before concentration, or by some other method of chlorination or pan amalgamation after concentration, is a matter that can only be determined by actual experiment with each ore. Almost invariably in concentration the greatest loss occurs not in the coarse tailings, but in the dirty water that is constantly flowing and apparently should have no values in it. This is where the great loss is occasioned. It is to take out this loss that, where possible, I would recommend some treatment before concentration. I have never yet seen the record kept of a concentrator in which the losses of silver or gold were not greater than the loss of the base mineral in which it was supposed to be. But this is arguing in a circle, as we go back to the first proposition.

"When we run across such propositions as this in mining—and they occur very frequently, sometimes in such a degree as to render worthless any particular kind of treatment, and at other times it being only a case of percentages, but not interfering with the commercial application of a process—it is then that we realize how very crude are our efforts and how much the future has in store in the study of this and similar problems.

"In writing you this I am not at all satisfied. I could give instances that have occurred in my experience, and I could prove the problem both ways to any one's satisfaction, both negatively and positively. I think if a man will study long enough on the subject of reduction of ores that in a short time his friends will find him talking to himself on the street. After all, these problems have to be, fortunately, decided commercially, and not scientifically; so, if we make a commercial improvement we can congratulate ourselves, whereas if we are obliged to make a scientific success, in many cases we would have to confess to utter failure."

The last two paragraphs are particularly illustrative of the fact so often noted by the most experienced in this business, that the most one can learn is to find how little, after all, he really knows of a subject to which he may have given years of patient, practical work—work that, too, may have been commercially successful, but from a scientific or even technical standpoint productive of satisfactory results only in a rudimentary way.

Ore Rates in Colorado.

Next month the Transmississippi freight bureau meets at Milwaukee, and, under the head of "unfinished business," takes up a matter of moment to the miners of Colorado. At the Denver meeting of the bureau last September was discussed the question of restoring the standard rate on low-grade ore, which was reduced three years ago. The matter was left for final settlement at the January meeting in Milwaukee. Colorado railroad men have all along rightly ruled in favor of the miner, purely as a business proposition for themselves, for, unlike the California rule of "all the traffic will bear," the Colorado railroads realize that the way to build up profitable and permanent business is to put the ore rate at a point that will give profit with promise of increase in amount, rather than restrict ore shipments by exorbitant rates. Colorado railroads have had much to do with the mineral development of Colorado. In continuance of such fostering policy they should stand as a unit at the Milwaukee meeting next month against the proposed increase. If they do, they will win. The increase would injure Colorado's mining industry by tending to close mines and restricting small mine operators in their shipments. Local business between mining camps and smelters should not be ignored, nor overshadowed by consideration of "through traffic." The Colorado miners are not asking any favors in this thing. They recognize the friendly attitude of the railroads and suggest as a business proposition that the railroads will best serve their own interests by according their local patrons all possible facilities. This is a matter that affects the business of thousands in and out of Colorado who furnish machinery and supplies, and who are thus almost equally interested in seeing that the proposed restoration of the old rates shall not be.

FOR the forty-first time the MINING AND SCIENTIFIC PRESS cordially wishes its readers everywhere "A Merry Christmas."

Concentrates.

A LEAD plummet is recommended for shaft measuring and mine surveying.

THE only known way of hardening aluminum is by alloying it with some other metal.

DYNAMITE is formed by mixing nitroglycerine with some inert substance, which lessens liability of premature explosion.

THE State of Washington is the only American commonwealth having a law making the "salting" of a mine a felony.

GUNPOWDER is prepared by intimately mixing saltpeter; charcoal and sulphur. Upon explosion the reaction is as follows: $2KNO_3 + 3C + S = 3CO_3 + N_2 + K_2S$.

THE product of combustion of nitroglycerine is water, carbon dioxide, oxygen and nitrogen. The reaction is probably as follows: $2C_6H_5N_3O_{18} = 5H_2O + 12CO_2 + O + 6N$.

TO DRILL a hole in glass with an ordinary drill it is only necessary to keep the spot moistened with a mixture composed of twenty-five parts oxalic acid and twelve parts turpentine.

IN a car 10½ feet long, 4½ feet wide and 15 inches high there are 59 cubic feet space. A gangway 8 feet wide at the top, 10 feet at the bottom, and 7 feet high, has an area of 10½ cubic feet.

THE Overland Monthly and the Journal of Electricity, both of San Francisco, in their November issues give excellent illustrated descriptions of the electric installation on the Comstock, Nevada.

BESSEMERIZING copper matte for refining was first used in this country at the smelter of the Parrott Co., Butte, Mont., and now almost entirely supersedes the reverberatory process in large establishments.

THE Guanajuato Con. M. & M. Co.'s properties were described and illustrated in the issue of July 7, 1900. The output is understood to average about $20,000 per month. The office of the company is in New York City.

THE primary function of a lubricant is to reduce friction and wear to a minimum. Friction is expensive, and the cost of a lubricant is of secondary importance to its friction-reducing power. The best is the cheapest.

CONCRETE has been used for lining mine shafts in Belgium and elsewhere in Europe. The cement used was made from blast furnace slag and sandstone. It consisted of 55% sandstone, 12.5% cement and 32.5% broken slag.

THE degree of heat at which scale forms and adheres to steel—that is, does not fall away from the piece when allowed to cool in air—is about 1550° F. It is then a light cherry red; it is yellow at 1825° and at 2200° is white.

ABOUT the best thing to use in tempering drills is a little borax. Wet the tool and sprinkle it on or, if hot, dip the tool into pulverized borax; then heat until the borax flows, and this will be at so low a heat that but a dark red can be seen; then chill.

A SUMP 12 feet in diameter, 25 feet deep, full of water to the top, and water flowing into it at the rate of twenty gallons per minute, would be unwatered in 1½ hours by a pump with a 7-inch end and 14-inch stroke, making seventy-five double strokes per minute, the efficiency of the pump being 72%.

THE only known method of producing auric chloride perfectly free from acid salt is to decompose aurous chloride with water. When gold is heated in chlorine at atmospheric pressure, trichloride of gold is formed and volatilized at all temperatures above 180° C., up to and probably beyond 1110° C.

A BLAST FURNACE which captures and controls the smoke from its charcoal pits, conveying it into stills, would find that an important factor in economy. Each cord of wood contains 28,000 cubic feet of smoke, susceptible of producing 120 pounds acetate of lime, two gallons alcohol and one-quarter pound tar.

LIQUID HYDROGEN is a limpid fluid, clear as water, but of $\frac{1}{14}$ as much specific gravity, so that cork sinks in it as lead in water. It is intensely cold, having four times the frigorific potency of liquid air. Atmospheric air freezes and sinks in it. Liquid hydrogen makes so perfect a vacuum that the electric spark will not pass through.

ALL exhibitors at Paris that have received awards, whether grand prizes, gold, silver or bronze medals, will receive with the diploma a bronze copy of the medal. Exhibitors who obtained an honorable mention will receive the diploma only. Gold or silver medals will be struck for those entitled to them by the Paris mint at cost price.

THE metric system was legalized in the United States in 1866, but its use is not obligatory. A bill is now before Congress prescribing that from January 1, 1902, the metric system of weights and measures shall be the standard in the United States. Public inertia defers the adoption of the system, though its general use is inevitable, it being the most accurate, the simplest and the best.

IT would be a mistake for Colorado or any other State "to use convict labor in developing mineral lands belonging to the State," as it would tend to degrade the miner. For centuries the miner was so degraded, and now that in later years he stands erect and assumes the godlike attitude of freedom and a man, it would ill become an American commonwealth to delegate the work of developing its mining resources to convict labor.

AT the Cariboo mill, Camp McKinney, B. C., the plates are dressed four times every twenty-four hours with a very dilute solution of potassium cyanide and sal ammoniac. The outside plates are scraped every second day, and a full clean-up is made twice a month. Of the total amalgam 68% is saved inside the battery, 13% on the lip plates, and 19% on the apron plates. The amalgam contains 30% bullion, and the bullion has a fineness of .670 gold.

THERE are honest men manufacturing gas engines, just the same as other machinery, and they can be relied upon to tell a prospective buyer whether or not a gas engine is suitable for his particular need. The gas engine manufacturer who understands his business will be able to give some valuable pointers to a possible customer if the latter describes his individual requirements; and if a gas engine is not suitable the gas engine manufacturer would find it better business to tell him so at the start than to make a failure of an installation because of untoward conditions.

ALTHOUGH anhydrous tungstic acid is soluble in water, especially when hot, yet it is scarcely at all soluble in water which contains any portion of acid. It appears to be insoluble in all acids except in hydrochloric and hydrofluoric acids, in which it is very sparingly soluble. Consequently, a dilute solution of hydrofluoric acid will not dissolve tungstic acid readily, if at all. A solution of tungstic acid in hydrofluoric acid would probably be yellow. Tungstic acid is more soluble in a hot solution of any alkali than in a cold one, but heat is not absolutely necessary to cause the solution.

ONE economical method of distributing electricity through a town would be to place dynamos and gas engines at substations and utilize the gas from the street mains for driving purposes. Such a scheme has much to recommend it, but it is doubtful whether any gas company would appreciate it sufficiently to bring down the price of gas to a point at which the experiment could be tried. There was a time when gas companies, by adopting some such policy, could have controlled the future of electricity supply; they missed their opportunity and have had to face a competition, which, with the apparently limitless possibilities before electricity, is bound to become more severe from year to year.

THE Johnson pneumatic cyanide process consists in expressing the water out of the slimes obtained from the mills by means of a filter press, displacing the moisture and soluble cyanocides in the filter cakes formed in the press by cyanide or potassium solution. The press is opened and the cakes of slimes dropped into a vortex mixing vat containing cyanide of potassium solution, which is arranged so that air can be drawn into the vortex, facilitating the working of the cyanide. After the proper amount of cake and cyanide solution have been placed into the mixing vat, the agitator having been previously set in motion, the gold is brought into solution. The slimes are passed through a valve into a second receiver and forced into the leaching press. The gold leaves this press in solution and is run over boxes containing fine zinc, precipitating the gold in a metallic form. The cyanide containing gold that may be left in the filter cakes is displaced by pure water.

A FEW MILES from Pittsburg, Pa., a well has been dug 5532 feet deep. Near Wheeling, W. Va., a well is 4920 feet deep. At Sperenberg, near Berlin, Germany, a hole in gypsum beds is 4559 feet deep. At Schladebach, near Leipsic, salt is taken from a well 6265 feet deep. The Red Jacket shaft of the Calumet & Hecla mine, in the Lake Superior copper district, is a mile deep, and men work in the shaft. Near by, the Tamarack mine has a shaft nearly as deep as the Red Jacket. At Paruschowitz, in Eastern Silesia, there is a well 6700 feet deep. They are still boring; it is the intention to go down 8800 feet. This last is now the deepest artificial hole in the world. At Lieth, near Altona, Germany, there is a hole 4388 feet deep; at Eu, near Strassfurt, is one 4241 feet; at Lubtheen, Mecklenburg, one 3949 feet; at Sennewitz, near Halle, 3644 feet has been reached; at Inowrazlaw, Posen, drills are working at 3624 feet; at Friedrichsane, near Aschersleben, a well is 3543 feet deep. At St. Louis, Mo., is a well 3843 feet deep. Many buildings in several parts of the world are heated with naturally warm well water; the hospital at Grenelle and large factories in Wurtemberg are examples.

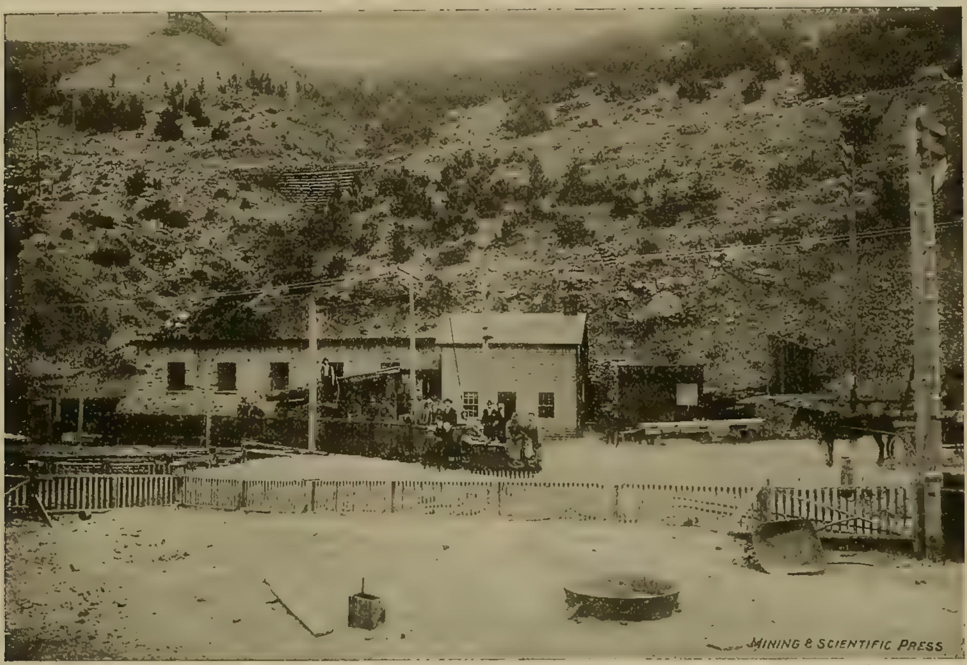
GOLD SCRAP containing platinum is kept apart for separate treatment in minting, as the ordinary methods of refining gold would not be suitable for it. In dealing with a large batch of metal, the sifted filings are digested with nitric acid of specific gravity 1.199 as long as any silver dissolved, a trifling amount of platinum also dissolving as silver platino-nitrite. The metal remaining is weighed and washed with aqua regia, until the silver chloride forming on the surface of the metal prevents further action. The solution of gold is then poured off and the silver chloride removed by treatment with dilute ammonia, when the metal is again in a condition for further treatment with aqua regia. After six alternate treatments with aqua regia and ammonia, the residual metal consists of pure platinum. The acid solution containing the gold is evaporated with excess of hydrochloric acid to drive off nitric acid, until gold chloride crystallizes out. This is then dissolved, and a small amount of platinum removed by adding ammonium chloride, the gold finally precipitated by ferrous sulphate. In one such operation the filings contained 28.05% of gold, 10.56% of silver, 45.46% of platinum and 15.93% of copper. If the metals are really alloyed, it is necessary to fuse with three parts of lead, or, better, of zinc. After granulating the melt, it is easy to remove the zinc by treatment with sulphuric acid, the gold, silver and platinum remaining in a finely divided form suitable for separation by the method already described.

RECORDS of mining locations must contain the name or names of locators, the date of location, and such a description of the claim or claims located, by reference to some natural object or permanent monument, as will identify the claim. No lode claim can be legally located until after the discovery of a vein or lode within the limits of the claim. The object of this provision is to prevent the appropriation of presumed mineral ground for speculative purposes to the exclusion of bona fide prospectors, before sufficient work has been done to determine whether a vein or lode really exists. The claimant should, therefore, prior to locating his claim, unless the vein can be traced upon the surface, sink a shaft, or run a tunnel or drift, to a sufficient depth therein to discover and develop a mineral-bearing vein, lode or crevice; should determine, if possible, the general course of such vein in either direction from the point of discovery, by which direction he will be governed in marking the boundaries of his claim on the surface. His location notice should give the course and distance as nearly as practicable from the discovery shaft on the claim to some permanent, well-known points or objects, such, for instance, as stone monuments, blazed trees, confluence of streams, point of intersection of well-known gulches, ravines, or roads, prominent buttes, hills, etc., which may be in the immediate vicinity, and which will serve to perpetuate and fix the locus of the claim and render it susceptible of identification from the description thereof given in the record of locations in the district, and should be duly recorded. In addition to the foregoing data, the claimant should state the names of adjoining claims, or, if none adjoin, the relative positions of the nearest claims; should drive a post or erect a monument of stones at each corner of his surface ground, and at the point of discovery or discovery shaft should fix a post, stake or board, upon which should be designated the name of the lode, the name or names of the locators, the number of feet claimed, and in which direction from the point of discovery; it being essential that the location notice filed for record, in addition to the foregoing description, should state whether the entire claim of 1500 feet is taken on one side of the point of discovery, or whether it is partly upon one partly upon the other side thereof, and in the latter case, how many feet are claimed upon each side of such discovery point. The location notice must be filed for record in all respects as required by the State or Territorial laws and local rules and regulations, if there be any.

THE substance of the grant made by the Government to the locator of a lode claim is the mineral deposit beneath the surface. Prior to the extraction of the ores, the extent of the deposit to be conveyed can be measured or defined only by surface survey lines, through which imaginary planes are drawn. Such survey lines do not invade the right of exclusive possession and enjoyment of the surface granted by statute to the senior proprietor. Such lines occupy the actual surface space of length or breadth. They are, however, the only practicable means of marking the section of the lode claimed by the junior locator. They mark the exterior boundaries, within which the rights of the junior locator are confined. The extent of his rights within these exterior boundaries is readily ascertained by excluding from the whole that which has already been granted or reserved to others. By this process no right of the senior locator is invaded. By no other process can the junior locator obtain what the law offers him. Therefore, the lines of a junior lode location may be laid upon or across the surface of a valid senior location for the purpose of defining for, or securing to, such junior location underground or extralateral rights not in conflict with any rights of the senior location. The term is not applied to the surface boundaries of portions of a claim which may be patented to different parties. The end lines are voluntary end lines, fixed by the locator of the claim. They are not the lines fixed by an adverse claimant to mark a different and conflicting claim. It will therefore be seen that, while at the surface, one has the right to but a small portion of the vein, as the end lines of the conflicting claims diverge, he upon gaining depth is constantly increasing the length of vein upon which he has the right to work until when the points are reached at which the planes of the conflicting end lines intersect, he gets the full 1500 feet along the course of the vein. In such a case as this, if the law confined the claimant to the interior of vertical extensions of the side lines, there would be little object in taking up the end lines of contiguous claims, as there would be not enough to warrant the expense of opening the property, unless the vein should be very rich, while an outside locator on the dip of the vein could take advantage of his knowledge of the situation and secure rights to a vein passing through his property, indeed, but which he had never discovered at all, and this would conflict with the intent of the law which was to reward the discoverer; and as discoveries are almost invariably made upon the apex, it does this by giving to the owner of the apex the ownership of the vein to any depth.

Consolidations in Gilpin County, Colo.

The accompanying illustrations on this and the front page pertain to present mining and milling operations at Black Hawk, Gilpin county, Colo., encompassing the ground whereon John Gregory in 1859 made the initial discovery of a gold-bearing lode in this State. It is historic ground, for it not only marks the first opening of a fissure vein, but the operation of the first stamp mill and, farther down Clear creek, the first smelter in Colorado. Black Hawk and Gregory hill are, in Colorado history, what Sutter's creek is in that of California. When the gold seeker and adventurer started from the Eastern and Middle States in 1859 and 1860 with wagons adorned with "Pike's Peak or Bust," their real destination was not Pike's Peak, but Gilpin county, whose creek sands carried free gold and whose mountain fissures held paystreaks. The vast ledges of gold-bearing ore which actually did exist in the hills contiguous to Pike's Peak were reserved by destiny till 1892, when the name of Cripple Creek was cautiously announced to a waiting world.



Gregory Gulch, Gilpin County, Colo., Showing Entrance to Gregory-Bobtail Tunnel, With Jeffrey Electric Locomotive Attached to Ore Train of Boston & Denver Con. M. & M. Co.

The discovery of the Gregory lode, the news of which rapidly spread, attracted much interest, Horace Greeley, editor of the New York Tribune, verifying the news by a personal visit to the property in June, 1859. As exploitation and development progressed on Gregory and Bobtail hills, other fissures were opened, principal among which were the Fisk, Bobtail, Mammoth and Cook, and these, with the Gregory, have formed the basis of operations ever since, though until recent years under several distinct ownerships and separate managements. Development on these lodes to the extent of nearly 25 miles of underground workings from the date of the discovery to the present time, the steady production throughout that period, and the extent of ore bodies exposed by more recent and deeper workings, give some conception of the life of a group of mines on such well marked fissures.

Formerly the Gregory–Bobtail, Fisk and Cook each operated with a separate plant of hoisting, pumping and compressor equipment, but whose workings became connected at various points. Within the last four years various consolidations and purchases have been effected whereby the three main groups, with other contiguous ground, all aggregating sixty-seven patented claims, have been brought into one consolidation, under the proprietorship of the Boston & Denver Consolidated Mines & Milling Co. This has been accomplished under the financial management of Melvin P. Dalton, with Clarence K. Colvin as mining engineer, and the ready co-operation of Boston and other Eastern capitalists. With the idea of centralizing operations, the extensive developments underground during the last two years have been so planned as to bring the ore from the various bodies to a common center on each level and ship it out through a main channel. The Cook shaft, 900 feet depth, which is now the center of operations, sinks at a point near the intersection of the main north and south lode with the two main east and west parallel lodes; so that very little dead work has been necessary to reach the ore bodies in any part of the group from this shaft. The latter is three-compartment, well timbered, with two cages operated by a gear and friction hoist, previously described in these columns. Within the shaft house are the boilers and two 4-drill compressors. At the 360-foot level is the loading station, where cars of ore are landed from any level in the mine and transferred to the tramcar track and hauled out through the mill tunnel to the crushing floor of the mill, 4250 feet distant. On the group there are about 15 miles of drifting on the veins; on either the sixth or seventh levels may be seen 11,000 feet of work in ore on a horizontal plane. The most aggressive work now is on the Mammoth vein on the sixth and seventh. In the stope above the sixth, on this vein, I saw five Sullivan air drills at work breaking down ore; one drill was drifting on the sixth. Similar work was in progress on the west end of the seventh level on the Mammoth and the east end of Fisk. For a distance of 150 feet this vein is stoped out between the sixth and seventh, showing the material between walls was 12 to 20 feet wide. On the west end of the Maverick vein were ten men with hand drills stoping above the seventh. On the eighth level the work of drifting west on the Mammoth and east on the Bobtail was in progress. The plan of work in this mine is to drift on the vein on each level, stull overhead and put in chutes every 20 feet; then stope up to next level, letting the broken ore pile up on the stulls as the work proceeds, about one-third of it being drawn through the chutes and hoisted to make room for the work. About 4 feet of solid ground is left at the bottom of each drift. When the stoping is completed to the level above, the broken ore is then drawn out through the chutes for shipment as fast as required. In one stope there are now at least 5000 tons of ore on the stulls and as much more in other stopes. The almost total absence of waste material between the vein walls makes this method feasible, and it reduces the necessity for timber. The Mammoth vein will average 12 feet wide on the sixth and seventh levels. It swells to 30 feet in places and narrows to 6 feet in others. The Bobtail vein averages 4 feet wide, the Maverick 5½, the Cook 5 the Fisk 4 and the Gregory 5 feet.

Cook Shaft House, Boston & Denver Con. M. & M. Co., Gilpin County, Colo.

The ores in general are a copper and iron sulphide, with streaks of quartz that carry free gold. There are no oxidized ores at present working depths. At the crushing floor of the mill the smelting grades are sorted out; this amounts to about twelve tons per day, the milling ore amounting to 300 tons per 24 hours. The smelting ore will carry about 31% silica, the mill concentrates 10%.

The mill, equipped with Blake crushers, eighty rapid-drop, 1000-pound stamps, amalgamating plates, and twenty-four Woodbury concentrators, was erected by the Hendrie & Bolthoff Mfg. & Supply Co., and was illustrated and fully described in the issue of this paper of July 14, 1900. It has been in operation several months, and every feature appears to do very satisfactory work, the concentrate product amounting to seventy tons per day.

The ore car line, 4250 feet long, which extends from the crushing floor of the mill to the 360-foot station of the Cook shaft, first runs 600 feet above ground, thence through 1280 feet of tunnel under Bates hill, thence 400 feet on surface in crossing Gregory gulch, thence through about 2000 feet of the old Bobtail tunnel to loading station at the shaft. The track is 24-inch gauge, with 30-pound rails, laid on 4x6-inch crossbars; it is ballasted and smooth. The four-ton, center-dump cars, capacity four tons each, are hauled back and forth by a Jeffrey electric locomotive, supplied with power by a 67 H. P. generator in the mill, which is transmitted over the line by an 00 wire, suspended at points 25 feet apart. Three cars make up a train, whose work runs as high as ninety-three cars, or 397 tons ore, in nine hours.

Another feature of the big group is the Gregory incline, which starts near the mill, runs at an angle of 24° for 700 feet, thence 1343 feet farther, to the base, at a 38° angle. At the incline's 900-foot station is a duplex, compound pump of 800 gallons per minute capacity. The first 665 feet of this incline is a crosscut, thence on it sinks on the Gregory vein. From the base of this incline a crosscut tunnel runs 800 feet southward to the Fisk, thence tapping the Bobtail lode 460 feet farther at 1300 feet below the surface and 600 feet east of the Cook shaft. The plan is to sink the Cook shaft to and below the level of the Gregory crosscut and connect the two, so as to handle the ore from the Gregory and other mines on the north side of the group, through the main shaft. At present about sixty-five tons per day are hoisted through the incline. In these operations there is no shoveling of ore, it being handled by gravity, electric haulage and automatic feeders; the concentrate product is carried by belt conveyors from the tables to the car on the side track. The entire property is a good example of the economy to be effected by the consolidation of mines, centralizing operations and increasing the tonnage. WASCOTT.

Black Hawk, Colo., Dec. 8.

"Booming" With a "Shooter."

A peculiar feature used in northern California to assist the placer and hydraulic miner is what is known as a "shooter." It consists of an automatic reservoir of various sizes and shapes, that collects all the water not run through the giants or monitors for, say, fifteen minutes, when a valve automatically opens of sufficient size to allow all the water thus collected to escape in five minutes, thus obtaining the use of over 20,000 inches of water for five minutes that 2000 inches has furnished by cacheing it for fifteen minutes; that force of water will carry boulders weighing over 500 pounds through one mile of flume in five minutes. Several hydraulic mines in the northern counties are equipped with one of these shooters. On the Boss & McClary placer mine, Trinity Center, Trinity Co., the shooter box is 20x40 feet square and 6 feet, with an automatic opening of 18 inches by 4 feet. There is a bedrock flume 6 feet wide by 3 feet deep, nearly half a mile long, lined with 9-inch blocks.

It was in northern California that the style of hydraulic mining known as "booming" was first introduced, and has since been most largely in use. It is practiced only along the gulches. These affording but little water, it became necessary that the limited supply be reservoired and properly distributed in order to make it effective in gravel washing. The object is attained by retaining the water in dams and then releasing it suddenly, with a rush or boom. Near the bottom of the dam built for this purpose is left an aperture so large that when opened the water escapes rapidly. Placed on the top of the structure is a small race, through which the water flows when the dam is full, and is discharged into a large wooden box suspended from the end of the sweep, turning on a pivot, and the upper end of which extends to and over the top of the dam. Attached to this end of the sweep is a strip of heavy canvas which, dropping in a fold over the aperture below, keeps it tightly closed when the dam is full. When this stage has been reached the water flowing through the race into the wooden box mentioned soon fills it, causing this end of the sweep to sink and the other to rise, carrying with it the strip of canvas and uncovering the large aperture below, allowing the water to rush out. Meantime, the wooden box, having emptied itself through numerous small holes made for the purpose, this end of the sweep, relieved by its weight, rises, and the other end drops. The canvas falls over the outletting aperture, closing it as before. Then the dam fills again to the brim, and the operation as above is repeated. This plan for handling water is wholly automatic. It takes care of itself and goes on day and night, without any attention on the part of the miner, doing its work as long as the water lasts.

C. A. SARGENT, referring to the necessities for larger improvement in the modern gas engine, takes up only the shortcomings of the gas engine of the four-cycle type in which the piston acts during the first, or forward, stroke, as a pump drawing in the charge of air or combustible mixture; compressing it on the second, or back stroke, completing the first revolution of the crank shaft; performing work during inflammation, the forward stroke of the second revolution and exhausting the burnt products during the back stroke of the second revolution. He suggests that if, instead of taking a cylinder full of combustible mixture as the unit of a fresh charge the engine is designed so that two-fifths or thereabouts of a cylinder full of combustible mixture is sufficient for the average load, there will be much greater range in which the engine may be worked without an appreciable loss in efficiency. As the compression changes only one-half as fast as the cut-off, with a change of load there will be a reserve of power, even if the release is considerably above atmospheric pressure, so long as compression does not go sufficiently high to cause premature ignition. The quicker the expansion of gases the more heat will be turned into work and the less transmitted to the cylinder walls. Therefore if the time of ignition is advanced so that the maximum of pressure takes effect at the beginning of the stroke, the piston speed may be materially increased and the jacket losses minimized.

"Orthodox" and "Wild Cat" Oil Propositions.

In chapter 4 of Bulletin No. 19, "Oil and Gas Yielding Formations of California," issued by the California State Mining Bureau, geological conditions attendant thereon are discussed and the commercial aspect of the problem given considerable prominence. In instancing the fact that the financial risks of prospecting for oil vary greatly, the chapter notes that oil prospecting propositions may be divided into two orders:

First.—The "orthodox" proposition. In this case the prospectors have in view a definite oil yielding stratum, which has proved remunerative in adjacent territory, and from which stratum they expect to obtain their oil. Moreover, they have satisfactory geological evidence in sight that the oil stratum they have in view forms an oil line through the territory they are about to prospect.

Second.—The "wild cat" proposition. In this instance the prospectors have no definite oil stratum in view which has proved remunerative in adjacent territory, or they have not satisfactory geological evidence in sight that an oil yielding stratum, which is known to be productive in adjacent territory, forms an oil line through the land they are about to prospect.

In prospect wells of the first order the least risk is taken where the outcrop of an oil sand, which has proved remunerative in a certain oil field, can be actually traced through the territory to be prospected, and the geological structure of the locality is known.

More risk, however, is undertaken where there is no outcrop of the oil sand, although the strike and dip of a remunerative body of oil sand in an adjacent oil field are known, and the rocks overlying the oil sand can be traced to the territory about to be prospected. When an oil line has been developed on one side of a fold, and an outcrop of oil sand has been discovered on the other side of the fold, propositions to prospect this side must be classed among the more risky "orthodox" propositions.

Most oil mining enterprises which have for their object the development of new territory, especially when operations are conducted at a distance from any known oil field, are "wild cat" propositions. Some idea of the conditions regulating the amount of risk involved in such enterprises may be gathered from the following statements:

The least risky "wild cat" proposition is the case in which the strike and dip of a remunerative stratum of oil sand in adjacent territory have been ascertained, and, although there is no conclusive geological evidence in sight; it is found after carefully platting a map of the territory that, if the stratum of oil sand were extended in the direction of its strike, without any material alteration in the angle of its dip, it would form an oil line across the territory to be prospected. It is a more risky "wild cat" proposition to prospect the side of a fold opposite to that on which an oil line has been developed, in cases where surface indications warrant the assumption that the same sequence of formation exists on both sides of the fold, and yet no outcrop of oil sand has been discovered on the side about to be prospected.

It is a still more risky "wild cat" proposition when a stratum of oil sand has been discovered, concerning which nothing is known except that the sand gives evidence of containing oil, and a well is sunk for the first time to determine whether or not the oil sand contains oil in remunerative quantities.

It is a much more risky "wild cat" proposition where no outcrop of oil sand has been discovered, but where a well has been sunk in a certain formation because it shows some irregular seepages of petroleum or because the formation appears to be similar to that containing a remunerative body of oil sand in other places.

It is well for oil prospectors to study the risk they are about to take before expending money, and care should be taken to control sufficient territory that they may have sufficient room to develop their oil field, in case their venture proves successful. No one should undertake the more risky forms of prospecting unless he can well afford to lose the money to be put into the enterprise.

In California petroleum is found in shales, limestones, sandstones and conglomerates, and in a few instances crystalline rocks are found impregnated with it; but in nearly all of the productive wells the oil is found saturating sandy strata. In this State the folding of the rocks has brought these oil-soaked strata near the surface, and the oil lines, or the lines along which remunerative wells can be obtained, are parallel to the axes of folds, or to the lines of faulting. The oil lines extend in breadth only a certain distance down the limbs of the folds or down the block of tilted strata, which has been isolated by faulting. The lateral extent of the oil line is limited at its upper margin by the outcrop of the oil sand, or by a line of geological disturbance such as a fault, or by the oil sand being brought too close to the surface at the axis of the fold on which the oil line is situated. On its lower margin it is limited by the dip of the formation, which carries the oil-yielding stratum to too great a depth for it to be profitably reached by the drill; or, where the oil sand is struck below a certain depth, it may be found that the water has displaced the oil.

As geologists and oil men know, the dip and strike of the oil sand are of the greatest importance in locating the site of an oil well, and in the case of prospect wells the dip and the strike have to be ascertained from the exposed rocks.

Many people are not familiar with geological terms, therefore it is in order to describe what is meant by the dip and strike of a stratum of rock, and to give simple methods for determining the conditions represented by these terms.

The dip of a stratum of rock is the angle which its surface, when inclined, makes with the horizon. The strike is the horizontal direction in which the stratum of rock extends, and is always at right angles to the dip. Therefore, if the direction of the dip is known, the strike can be readily determined.

The direction of the dip of an inclined stratum corresponds to a line drawn along the inclined surface in the direction of its greatest inclination, and is always at right angles to the strike. (See article by the writer in MINING AND SCIENTIFIC PRESS, Feb. 4, 1899.)

(TO BE CONTINUED.)

Silvering Copper Plates.

There are several methods adopted in the silver plating of copper plates. In one of these methods the plates are silvered by painting the back of the plate with some substance which does not readily transmit electricity, such as paraffine, or a similar substance, and then immersing the plate in a solution of cyanide of silver. Such a solution may be formed by dissolving silver cyanide in cyanide of potassium, or it may be made up by taking a solution containing 1 part of cyanide of potassium to 10 parts of water, adding 1 gram of silver chloride to every 150 c. c. of the cyanide solution. The plates are immersed in such a solution and are connected with the negative (or zinc) pole of a galvanic battery, the positive (copper or platinum) pole of the battery being connected to a silver plate also immersed in the solution. The current gradually decomposes the silver cyanide, and this metal is deposited on the object connected with the negative pole, while the cyanogen liberated at the silver plate attacks the silver so that the solution is always maintained at the same strength. The quantity of silver dissolved from the silver plate is exactly equal to that deposited upon the copper plate.

A very thin silver plating can be put on copper plates by rubbing them with a mixture of 10 parts of silver chloride, 1 part of corrosive sublimate (mercuric chloride) and 10 parts of bitartrate of potash. The silver and the mercury are both reduced to the metallic state by the copper, and an amalgam of the silver is formed which merely coats the surface. The surface to be covered should, in any case, be carefully cleaned by immersing in, or washing with, dilute nitric acid and then washing in water. This last named method is not much, if any, better than the ordinary process of preparing copper plates with mercury and sal-ammoniac.

Verdigris can be prevented by neutralizing any acids contained in the ore with lime, or similar compounds; and should spots of verdigris appear on the plates, they should be scrubbed off with sal-ammoniac or a little cyanide, and the spots rubbed with mercury, preferably containing a small amount of amalgam. It is best never to use cyanide of potassium on silver plates, as it simply dissolves some of the silver and carries it away with the wash water. Permanganate of potassium does not neutralize the effect of cyanide of potassium.

The Twentieth Century's Dawn.

The first people to live in the twentieth century will be the Friendly Islanders, for the date line, as it may be called, lies in the Pacific ocean just to the east of their group. At that time, although it will be already Tuesday to them, all the rest of the world will be enjoying some phase of Monday, the last day of the nineteenth century (December 31, 1900). At Melbourne, Australia, people will be going to bed, for it will be nearly ten o'clock; at Manila, Philippine Islands, it will be two hours earlier in the evening; at Calcutta, India, the English residents will be sitting at their Monday afternoon dinner, for it will be six o'clock; and in London the clock in the tower of the House of Commons will be striking the hour of noon. In Boston, New York and Washington half the people will be eating breakfast on Monday morning, while Chicago will be barely conscious of the dawn. At the same moment San Francisco will be in the deepest sleep of what is popularly called Sunday night, though really the early, dark hours of Monday morning, and half of the Pacific will be wrapped in the darkness of the same morning hours, which become earlier to the West, until at Midway or Brooks Island it will be but a few minutes past midnight of Sunday night.

Important Land Office Decision.

On the 18th inst. Land Commissioner Hermann decided the case of the Kern River, Cal., Oil Company vs. C. W. Clark, from the Visalia, Cal., land district, which was commonly known as the "scrippers' case," against Clark, defeating the claims of the scrippers. The report is an elaborate one and will settle many questions in addition to that which brought it before the land office. Despite its fullness and the many decisions cited in it, it is understood that S. C. Ward, on behalf of the scrippers, will appeal to the Secretary of the Interior.

Clark claimed title to a forest reservation by virtue of two separate selections. The oil company protested that these lands were mineral, and claimed them under mineral locations made prior to the date of these selections. About the time these selections were made it was represented to the land office that the lands in this and a large number of adjoining townships were solely valuable for their petroleum deposits, for which they had been located under the mining laws and for which they were being developed. The survey of the lands over forty years ago made no reference to minerals, and returned the lands as agricultural, and the opinion says the lands remained unclaimed under the agricultural laws until after their location as mineral.

The Commissioner holds that those claiming title to selections under the Act of June 4, 1897, have not done all they are required to do until they have filed proof required, made proof of the publication of notice and the same has been approved by the General Land Office.

Under this ruling the opinion says the land in these sections is yet open to exploration under the mining laws, and that if at this date the lands are shown to be mineral, it defeats the selections. The opinion says: "It does not seem that any question could arise as to who had the best right to this land and to whom the mineral product belongs. Even if no well should be sunk at the date of selections and the mining claimants had rested solely upon the surface discoveries, but were duly proceeding with reasonable diligence to develop the claims, the agricultural claimants would not have been entitled to the land as 'vacant land, open to settlement.'

"If the lands are not distinctly agricultural in character, but, in addition, contain on the surface mineral indications justifying a discreet person to prospect and develop the same, then the affidavit which avers that 'the application, therefore, is not made for the purpose of fraudulently obtaining title to mineral land, but with the object of securing said land for agricultural purposes, so far as the deponent knows,' is not only evasive but misleading, and evidences a motive for acquiring the lands really for mineral and not for agricultural purposes.

"The good faith of the mineral claimants is apparent and conclusive. They seek to obtain, in a proper manner, title to lands under laws solely provided therefor. I do not find the same conditions existing in the case of the agricultural claimant, who seeks to acquire mineral lands under agricultural laws, the lands being admittedly mineral and not agricultural."

From this the Commissioner deduces the following: "At the date of these selections the lands included therein were covered by mining claims and therefore not vacant; that they were known to be mineral and, therefore, were not open to settlement; that the fact that the conditions were not on record in the Land Office did not affect the mineral locators' rights; and the failure of the agricultural claimant to state the facts was a fraud on the Government and the mineral claimants, as the selectors are charged with notice of mineral locations. If any further evidence is needed in support of the above conclusions it is to be found in the special agent's report, made with reference to these particular selections, nor can there be any question of the authority of this office to consider such report in connection with the record in this case."

In previous issues were given the details of the consolidation of the American Smelting & Refining Co. and the Guggenheim smelters. Official announcement is made of the absorption. Stockholders of the former company will be asked to assent to the proposition that the capital be increased from $55,000,000 to $100,000,000; of this amount $15,000,000 to be added to the working capacity of the company. The Guggenheims receive the difference between the $55,000,000 and $100,000,000, less the $15,000,000, which it is proposed to utilize for extra working capacity. None of the new stock will be offered for sale. The stockholders of the smelting company will hold a special meeting after Jan. 1 to ratify the action of the directors.

Some Questions Answered.

What causes zinc shavings to become very brittle and crumble to dust within a few hours after being put in the extractor, and what remedy would you suggest? I suppose that it is sulphur in solution and I have used lead acetate, which seems to prevent the zinc getting brittle quite so soon.

Isabella, Cal.

It is not possible to answer this query concerning the cause of the brittleness of the zinc without an exact knowledge of the composition of the solution; but it is probably due to cyanide of mercury in his solution. This precipitates on the zinc as zinc amalgam and rapidly causes the zinc to become brittle. The fact that the lead retards the brittleness seems to indicate that the latter absorbs mercury and protects the zinc to some extent. He might retort some of the brittle zinc and see whether or no he gets mercury.

(1) If I make a mining location while in the employment of another person or company, can my employer, by law, claim half of said located ground, no agreement to that effect having been made?

In the absence of any agreement, grubstake or otherwise, he can not.

(2) In parting my bead, why is the gold always black before annealing?

Regarding the black color of gold upon parting and before annealing, it is generally believed that such gold is coated with some salts of gold that is reduced to metallic condition by annealing, for before being annealed it will not amalgamate with quicksilver nearly so readily.

(3) Give a method for determining the fineness of gold bullion or dust.

Gazelle, Cal.

There is no method other than assaying to determine the actual fineness of gold.

Some time ago you published the legal code or system of mine bell signals in use in Montana and California. Is there not a similarly ordained set of signals legalized in the State of Colorado, and, if so, will you state what it is?

Breckenridge, Colo.

A State legislative Act authorizes the Colorado Commissioner of Mines to establish a uniform code of signals in all mines using hoisting machinery as follows:

Signals.—1 Bell—Hoist. (See Rule 2.)
1 Bell—Stop, if in motion.
2 Bells—Lower. (See Rule 2.)
3 Bells—Men on, run slow. (See Rule 2.)
7 Bells—Accident. Hoist or lower by verbal orders only.
3–2–1 Bells—Ready to shoot. (See Rule 3.)

Engineer's Signal.—Engineers shall after signal 3–2–1 raise the bucket or cage 2 feet and lower again, and shall remain at his post until final signal is given and command executed.

Rules Governing Signals.—Rule 1.—In giving ordinary signals make strokes on bell at regular intervals. In signals similar to "Ready to shoot" (3–2–1 bells) each bar (–) must take the same time as one stroke of the bell.

Rule 2.—When men are to be hoisted or lowered, give the signal for "Men on; run slow," (3 bells). Men must then get on bucket or cage, then give signal to hoist or lower (1 or 2 bells).

Rule 3.—After signal "Ready to shoot" (3–2–1 bells), engineer must give signal that he is ready to hoist by raising and lowering bucket 2 feet. Miners must then give the signal "Men on" (3 bells), then "spit fuse" get on bucket or cage and give signal to hoist.

Rule 4.—All timbers, tools, etc., longer than the depth of bucket, or placed within a cage, must be securely lashed before being hoisted or lowered.

Rule 5.—Signals to meet local demands and not in conflict with above may be added by individual operators, but the same must be posted in clear and legible form in connection with above code.

Please give in "Concentrates" a formula for the preparation of cadmium boro-tungstate.

Spokane, Wash.

After two weeks' effort, it is not found possible to answer this question.

Suppose a man has a group of adjoining and intersecting claims, and by driving a tunnel he can develop all of them; can he do all the required assessment work by running such tunnel?

Telluride, Colo.

Certainly; if he can prove the above statement and does $100 worth of work for each claim in the manner specified—that is, suppose the Telluride inquirer has six such claims; by doing $600 worth of work in the tunnel he does the required annual assessment work for the whole six; if he have eight claims, $800, and so on. But, in Colorado, he must, to make matters sure, do more. He must "erect a substantial post, board or monument at the mouth of the tunnel, upon which should be posted a notice giving the names of the parties or company claiming the tunnel right; the actual or proposed course or direction of the tunnel; the height and width thereof and the course and distance from the face or point of commencement to some permanent well-known object in the vicinity." Then our Telluride inquirer should make a copy of all this and file it with the clerk and recorder of San Miguel county.

State in "Concentrates" how to locate a mill site and a water right on the same site. The mine is not contiguous thereto, but near by.

Morenci, Arizona.

Section 2337 U. S. Revised Statutes gives the required method of securing a mill site. A water right upon the public domain can not be acquired under the mill site laws.

Please answer in "Concentrates": A located a mining claim in 1893; B made a location in 1894 and overlapped A's ground; A and B filed their notices for record; C made a location on the ground originally held by A after A forfeited his original rights for not doing the annual assessment work. Which one is entitled to the ground originally held by A?

Eureka, Utah.

C has a right to that portion of A's original location not in conflict with B's location.

Through A's patented placer claim runs a creek. A has not located the water and does not use it. Can B locate the water on A's ground and pipe it over A's ground to B's ground and use it for mining purposes?

Newsome, Idaho.

No; not without A's consent.

What is meant by the "mother lode" in California? Give a description of it.

Deadwood, South Dakota.

The ordinarily accepted meaning of the term "mother lode" as used in California conveys the idea of a continuous fissure extending in a northwesterly direction from Mariposa county, and filled with metalliferous deposits. Another idea of it is that it is not a single, unbroken, continuous fissure, but a series of fissures of various lengths and widths, within, and invariably conforming in strike with the sedimentary rocks known as the black or Mariposa slates. To give even a list of the articles written on this subject would take up a page of this paper. Probably the best among the more recent monographs on the subject is "The Mother Lode of California," written for this paper by Ross E. Browne, a two-page article in the issue of Jan. 29, 1898. The finest thing of the kind is the Geologic Atlas of the Mother Lode, just issued by the U. S. Geological Survey. It is beyond praise for correctness and completeness, would be cheap at $25 and can be had by sending 50 cents (exactly that amount) to the Director of the U. S. Geological Survey, Washington, D. C., with request for its receipt.

I know of a deposit of kaolin near here. What is it worth and where could I sell it?

Ashcroft, B. C.

If in considerable quantity, and favorably located, a kaolin deposit might be made commercially valuable. It is found in several places from San Diego, Cal., to the Alaskan line. When graded, washed and ready for market, the best quality is worth about $14 per ton. It is largely used in the manufacture of pottery and china. One of the principal markets for it is at Trenton, N. J. Considerable is imported, cheap, as ballast, and there seems little to say in encouragement of our British Columbia correspondent.

(Other recent questions are answered in "Concentrates," page 592.)

Rank in Population and Railway Mileage.

The following table shows the rank of the various States as regards population and miles of railroad operated within their borders:

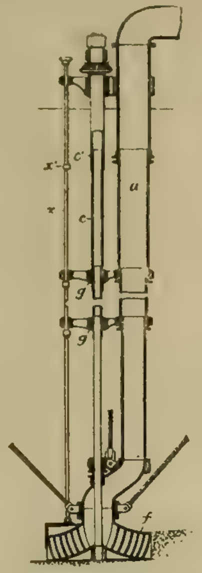
States.	Population.	Mileage.	States.	Population.	Mileage.
New York	1	7	Maryland	26	39
Pennsylvania	2	2	Nebraska	27	14
Illinois	3	1	West Virginia	28	32
Ohio	4	5	Connecticut	29	44
Missouri	5	9	Maine	30	34
Massachusetts	6	33	Colorado	31	16
Texas	7	3	Florida	32	20
Indiana	8	11	Washington	33	25
Michigan	9	8	Rhode Island	34	49
Iowa	10	4	Oregon	35	36
Georgia	11	13	New Hampshire	36	43
Kentucky	12	23	South Dakota	37	26
Wisconsin	13	12	Oklahoma	38	47
Tennessee	14	21	Indian Territory	39	40
North Carolina	15	19	Vermont	40	45
New Jersey	16	31	North Dakota	41	29
Virginia	17	18	Dist. of Columbia	42	50
Alabama	18	17	Utah	43	37
Minnesota	19	10	Montana	44	24
Mississippi	20	28	New Mexico	45	35
California	21	15	Delaware	46	48
Kansas	22	6	Idaho	47	41
Louisiana	23	30	Arizona	48	38
South Carolina	24	27	Wyoming	49	42
Arkansas	25	22	Nevada	50	46

Mining and Metallurgical Patents.

Patents Issued December 11, 1900.

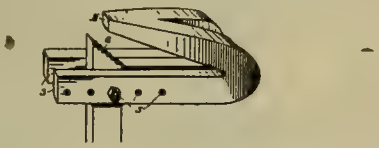
Specially Reported for the MINING AND SCIENTIFIC PRESS.

HYDRAULIC PRESSURE DREDGING MACHINE.—No. 663,497; F. Hoffman, Siegersdorf, Germany.



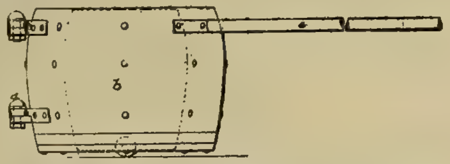
In a pressure dredging machine, combination with elevating tube, turbine at lower end of tube to loosen and force upward through tube solid matter, curved shield party surrounding turbine and vertically adjustable independently of turbine to regulate inflow of water to turbine, means to rotate turbine.

PIPE WRENCH.—No. 663,567; P. Frichette, Sheridan, Cal.



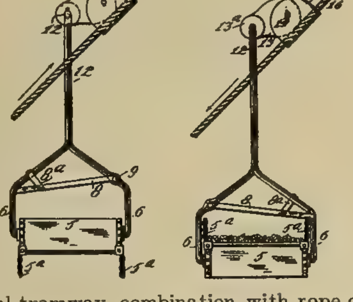
Pipe wrench consisting of single integral bar folded midway upon itself to form converging jaws, bar split from point commencing near outer end of folded portion to form two straight parallel sides separated from each other, provided with adjusting holes, lever fulcrumed between separated sides having end adapted to compress pipe into folded portion of bar whereby pipe has independent contact upon separated sides and third point of contact on overhanging folded portion.

CRUCIBLE SHAKER.—No. 663,676; J. Illingworth, Newark, N. J.



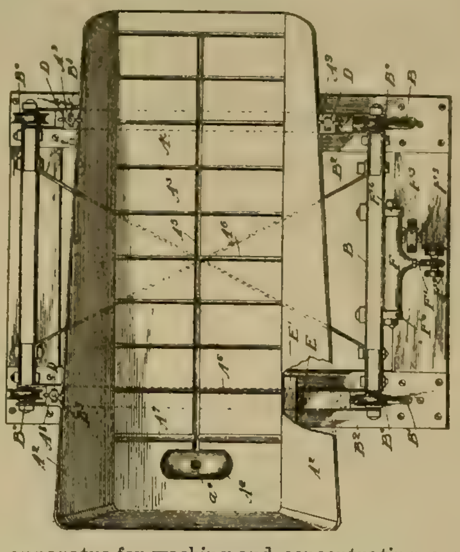
Improved crucible shaker, comprising pair of hinged jaws having handles, arranged at free ends of jaws, opposite hinged ends, handles being adapted to be brought to lie near together when jaws are closed to faciliate shaking of jaws and crucible therein, jaws being hollow semicircular parts filled with a non-conductor of heat and having interior lining of metal.

AERIAL WIRE ROPE TRAMWAY.—No. 663,817; J. H. Montgomery, Denver, Colo.



In aerial tramway, combination with rope or cable and suitable carrier, of shoe, lever connecting shoe with pendent arm of carrier, and arranged to grip cable automatically, suitable means mounted on stationary support and lying in path of portion of lever, whereby extremity of lever connected with pendent is raised sufficiently to release cable, allowing latter to travel through shoe which remains stationary.

GOLD MINING OR PLACER MACHINE.—No. 663,717; C. Barwick, Denver, Colo.

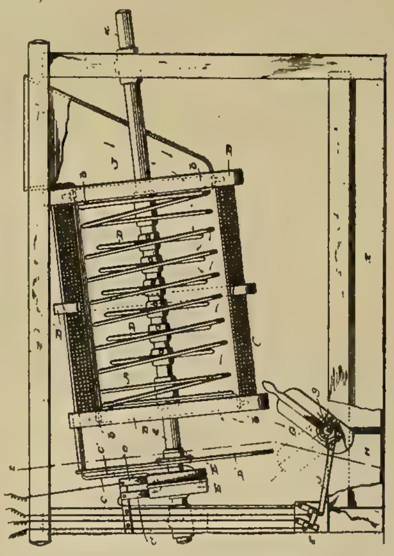


In apparatus for washing and concentrating ores, combination with reciprocating frame, of concentrating pan provided with closed end and open end mounted transversely of frame, and set at an inclination downward from open end; well or pocket in bottom of pan near its closed end, longitudinal channel in bottom leading to well or pocket; transverse channels leading to longitudinal channel; perforated lugs on side edges of pan, screw-threaded bolts mounted in frame and engaging perforated lugs; coiled springs interposed between lugs and frame, and surrounding bolts; thumb nuts engaging ends of bolts for adjusting inclination of pan upon frame; stops permitting of vertical adjustment of pan, but preventing lateral movement thereof with respect to frame.

PROCESS OF PRODUCING SOLUTIONS OF ZINC CHLORIDE.—No. 663,759; C. Hoepfner, Frankfort-on-the Main, Germany.

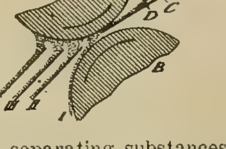
Reacting upon an oxide or insoluble salt of zinc in presence of water with sulphurous acid to form soluble zinc bisulphite, precipitating from bisulphite so obtained insoluble monosulphite of zinc, treating latter with chloride of an alkali metal to form zinc chloride.

MAGNETIC ORE SEPARATOR.—No. 663,760; A. Johnson, Moline, Ill.



In magnetic separator, combination of solenoid composed of plurality of oppositely wound coils arranged within solenoid but out of contract with inner circumference thereof and adapted to be magnetized by induction, means for making and breaking circuit through coils of solenoid.

MAGNETIC SEPARATOR.—No. 663,764; E. Kreuser and H. E. Langguth, Mechernich, Germany.



Apparatus for separating substances of different magnetic susceptibility, consisting of two magnets arranged one above other, upper one comprising rotatable cylindrical magnet, pivoted inclined slide or chute having no magnetic susceptibility, lowermost end of slide or chute being projected between magnets into center magnetic field at point of least distance between magnetic surfaces, spring arranged to hold lower end of slide in yielding contact with upper rotatable magnet.

Science vs. Technology.

A great deal of harm is done to technical progress by scientific cant. According to scientific cant, nothing that is technical is scientific. Science is only concerned with phenomena, and not with their useful application. If you experiment with 37 grammes of steel in a porcelain crucible, or in a tiny electrical furnace, with a standardized platinum pyrometer and a spectroscope, you are doing scientific work; but if you work with a ton in a converter, this is merely technical—though you will be patronizingly told that your work may throw some light on scientific questions. No scientific man will deny in words that the probable ultimate use to man is the criterion of value of a scientific discovery; but at the same time the tacit assumption is that anything technical is unscientific. The common type of scientific man thinks his knowledge of necessity includes all technical knowledge; but he cannot for a moment believe the technologist's knowledge may include his. The result of this sort of scientific priggishness is that technology is discouraged, and made out to be less important than it is, while unimportant work is exaggerated as to its value. Pure science, as it is called, is considered something much higher than applied science. This is the wrong way round. The terms are misapplied to begin with. One kind of knowledge is not purer than another. What is called pure science is really merely the raw material, and the raw material has to be worked up by the engineer for the use of man. Which is higher, the raw material or the finished product? In the case of ordinary raw material, such as iron, it is produced intelligently, with the view of being worked up; that is to say, it is produced for a given purpose. The scientific man does not work intelligently in this sense. He produces raw material without knowing or caring whether it can be worked up, just as the insect produces silk. If anything, he prefers what cannot be worked up. The sperm whale sometimes produces ambergris, and also produces other matter, but we do not admire the sperm whale because he unintelligently produces what is sometimes valuable when worked up. This view of pure science is so unconventional that few readers will agree with it; but it may be largely true all the same. One idea is that it is beneath the dignity of a scientific man to apply anything to technology. If he finds out a new phenomenon he should read a paper on it, but it is below his dignity to take out a patent. One form of hypocrisy in connection with this is the pretence that the scientific man works entirely for love of science. He has no wish to advertise himself or bring his name forward. If one scientific man says, in the interests of pure science, that he has done something which another man claims, there is generally a very acrimonious dispute—all in the interest of pure science, and not at all in those of advertisement. The worst of it is that the purely scientific man does not confine himself to his pure science, but considers that his knowledge covers all applied science ex officio, and the public unfortunately shares his view.—The Engineer.

A MINE, the product of which is timber, is noteworthy. A mine of this sort is to be seen in Tongkin, China, where, in a formation of sand, at a depth of from 14 to 20 feet, a deposit of the stems of trees, which thousands of years ago must have existed as an extensive forest, but eventually became buried by an earthquake or other similar phenomenon, has been opened and is now being mined through gangways. The timber in no way forms any kind of coal, but is in good condition, a fact to be attributed to the large proportion of resin which it contains, and to the sandy nature of the ground in which it lies. The Chinese work the mine methodically, and use the timber for sculptural purposes, coffins, troughs, etc. The stems have a diameter of 3 feet, are 45 feet long, and appear to be a kind of fir.

COUNTY CLERK WALKER has received a letter from J. R. Heaston, Indianapolis, Ind., who says that in 1860 he located sixty mining claims in this county, and wants to know whether his title is still good. He says he has great faith in our mines. His faith must be sublime to suppose his title good to lodes located forty years ago and abandoned all that time. We fear Mr. Heaston has been equally negligent in his study of the Bible, or he would have been aware that faith without works is dead.—Georgetown, Colo., Courier.

REFERRING to the illustrations in the article on inland dredging on page 597, Fig. 1 shows the dredger working inside the pit; Fig. 2 shows the manner of enlarging the pit. The lines a, a, designate the width of the new face. The lines b and c represent new faces. The successive movement of the dredger is indicated by arrows.

Suggestions on Inland Gold Dredging.

Written for the MINING AND SCIENTIFIC PRESS by A. C. ETESON.

To those who are interested in gold dredging a few suggestions on the practical working of a dredger may be of value. The following observations are based on my own personal experience.

The dredger of which I am writing is of a continuous-bucket type, operated from the shore with five steel lines—one head line, two bow side lines and two stern side lines.

Each of these lines is wound on a separate drum in the winch, which is operated by one man, so the position of the dredger can be changed in a few seconds.

No spuds being used, the dredger works on the head line and so gains all the advantage of its resiliency. The gravel, after leaving the buckets, passes through a revolving screen. The gold, sand and fine gravel are washed out and pass over special tables, where the gold is caught, the fine gravel and sand passing over the stern. The coarser gravel, after leaving the screen, is elevated and dumped behind the dredger.

The dredger under consideration is an inland proposition, operating some 4000 feet from the river. An excavation 80x90x10 feet was first dug, into which the hull of the dredger was placed. This excavation was then filled with water (Fig. 3) and the machinery placed on board.

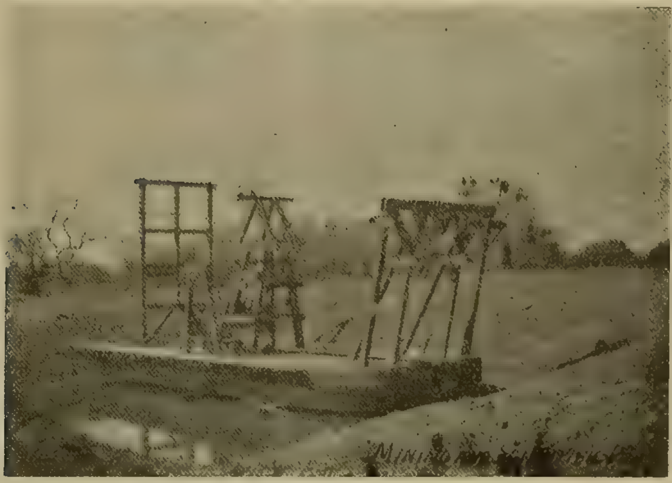


Fig. 3.—Hull of Dredger in Excavation.

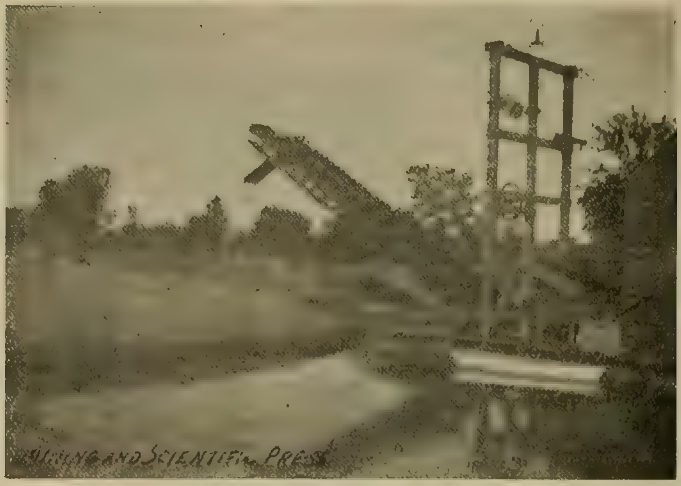

Fig. 4.—Dredger in Correct Position Starting Work.

The boat was then ready for operation. The first important point when the boat commences operations is the opening out of the face, or bank, to be worked.

If commencing in rich ground, there is a tendency to open out the face too rapidly, with the result that you get in difficulty with your tailings. First, place the dredger on one side of your face, as far back as possible (Fig. 4), so as to allow the tailings to be dumped on the bank behind. The tailings should be so dumped that, on the completion of the cut, they present one even line, and not a series of peaks (Fig. 5), for by this means you economize tailings space.

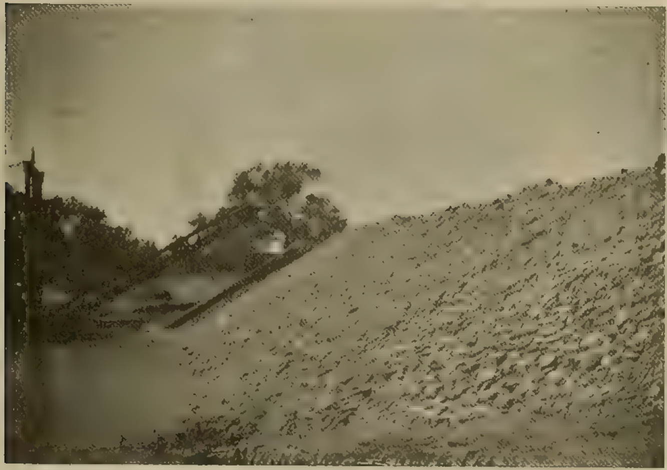

Fig. 5.—Tailings as They Should be Stacked.

Too much care can not be taken in keeping the sand and fine gravel from the sluices back. This can be done with brush, sacks or lumber.

Continue working in the same position till you have no more tailing room; then move over a few feet toward the open water, and repeat the operation till you have worked across the face. Great care should be taken always to keep the boat at right angles to the face, so as always to keep a full boat's length between the face and tailings. In ordinary digging there are only two exceptions to this rule, viz: working a corner or opening out the face, to which I shall refer later. One should not endeavor, under ordinary circumstances, to work down to bedrock under five or six cuts, or open out the face till bedrock is reached. By the time bedrock is reached, there is more tailing room, and now, if necessary, is the time to open out.

The following is the method of working a corner: (See Fig. 1.) When the dredger is within about half a boat's breadth of the port side of the face, move the stern over as far as possible to port, so that the tailings dump on or close to the port bank. Now, as you work with your ladder to port, pull the stern gradually over to starboard, until, when the ladder is on the extreme end of the face, the tailings will have filled up the gap behind. Now pull ahead and start on a fresh cut, and, as your ladder works to starboard, the stern gradually works to port, until when the ladder is about half the breadth of a boat from the port side, the tailings will be dumped on the port side of your tailings pile. Now pull the stern over till the boat is at right angles to the face and you will find that your tailings will be dumping on the starboard side of the new line of tailings.

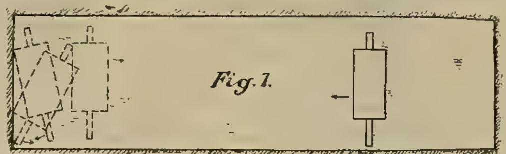

Fig. 1.

Work squarely across the face.

The starboard corner is worked in a similar manner to the port.

To open out a face: (Fig 2.) This is done in much the same way as working a corner, the only difference being that you have to work at a greater angle to your face to enable you to dig out the side. Suppose that you are opening out to port: To get your buckets in a position to do so, you will have to pull your stern well to starboard. Now you will find the farther you pull your stern to starboard the farther the tailings will dump from the tailings pile; this might fill up your floating space and would get in your way when you squared up and worked across your face. To prevent this the following method should be employed:

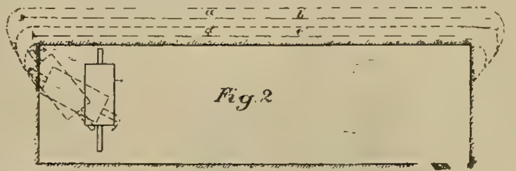

Fig. 2

When you have pulled the stern around sufficiently to enable you to open out, if the tailings are dumping over the tailings pile, let the boat back as far as possible, so that the tailings dump on the tailings pile. Then pull the bow into the bank and open out according to your judgment and the amount of tailing space. Then gradually pull ahead and at the same time pull the stern in to port. Make the tailings dump or the tailings pile when you are once more square again. You will not have a square corner to your face, but a rounded one; the greatest width of your face will not be across the face you are working but a little behind, so that in opening out you do not open out on the cut you are making, but some few yards behind it.

Continue this operation on either end of your face and you will find that, with care, you will always have clear water from end to end of your face.

A VETERAN prospector's advice to locators of mining claims is to follow the vein by sinking incline shafts on the outcroppings in at least four places along its course, after running open cuts at intervals to determine whether the vein is continuous and holds out in breadth and value a few feet below the surface. After the vein has been prospected by the foregoing mentioned methods in at least four different points, assays of the rock will show whether the vein grows richer in one direction or carries uniform values. There is no other way by which the ground can be shown up so thoroughly, and the ore taken out will often go a long way toward paying expenses. Even if the ore is not rich enough to pay for shipment, it is always evidence of the value of the rock in the vein and is a tangible, self-evident thing to show a prospective investor. Again, shafts, vertical or incline, that follow the vein, will show up any changes in the ore and give a large amount in sight. Thus, four shafts 50 feet wide down in a ledge 4 feet wide would expose 1680 square feet on the vein. A tunnel driven 200 feet through rock to cut the vein would expose but the section, the height and width of the tunnel, say, 100 square. To expose a large area drifting must be done, and such drifts can be run with better discrimination at the foot of a shaft that has followed the ore. If indications of water are found in sinking, and the prospecting of the vein, as described, demonstrates that its value warrants the outlay in labor, and the ground is situated so that the water can be drained to a depth of 200 or 300 feet by tunneling, then the latter is advisable, as it is obvious that draining a mine through a tunnel is far more economical than performing that work with surface pumping plants.

Very Quick Work.

On the line of the Chicago & Erie railroad, it had been found advisable to replace bridge No. 30, an old iron structure of 150 feet span, with a new steel structure 151½ feet long. The necessary changes in the masonry made it necessary to trestle the track and take down the old bridge. This was done and the new bridge was erected at the side of the trestle. When all was ready the trestle was taken down and the new bridge was moved over into place. The following is a time record of the various stages of the work:

Got use of track at 11:55.
Rails off bridge at 12:00.
Trestle down and all clear at 12:10.
Started to move the bridge in at 12:12.
Bridge moved over at 12:35.
Bridge lowered down upon the seats and a 42-foot approach girder raised to the surface of the new bridge at 1:10.
Rails laid on bridge and spiked up ready for traffic at 1:15.

The weight of the new bridge is 191,000 pounds. No trains were delayed in making the change.

AT the recent congress of German anthropologists at Halle, Prof. Klaatsch of Heidelberg read a paper contending that, as the result of several years' investigation, the alleged descent of man from apes was no longer maintainable. His conclusion was based on the construction of the bicephalous muscle of the upper thigh. The professor incidentally contended that it was a mistake to regard man as the most perfectly developed mammal in all respects. His limbs and teeth do not show any high degree of development, and he is only superior to other animals by his extraordinary brain development.

MINING SUMMARY.

Specially reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

One thousand pounds of ore from the Gleaner, on Taku arm, near Skaguay, arrived in Victoria, B. C., on the 17th inst.; it is estimated that it will return $12,000, or $12 to the pound.

This year's yield of Nome and Klondike is expected to aggregate $25,700,000, divided as follows: Klondike, $21,300,000; Nome, $4,400,000.

The mines on Admiralty Island are shipping ore to the Tacoma, Wash., smelter.

"Those who believe that the sea washes up the gold on the beach at Nome are laboring under a wrong impression. The sea concentrates the gold which is carried down to the tundra and beach by the mountain streams. As for the bedrock, which has deluded so many persons, that is a false bottom, the true bedrock being in some places 30 feet below the false bottom," M. J. David says, who has been working in the Nome district.

Teller City, the new town on Port Clarence bay, though only about six months old, seems destined to rival Nome within the next year or so. It has a land-locked harbor, the only one in Alaska on Bering sea north of Dutch Harbor. It is said that 1200 people are wintering there.

ARIZONA.

COCONINO COUNTY.

Twenty-five men are working on placer claims near Lee's Ferry. An Eastern company will put in a dredger on the Colorado river next spring.

COCHISE COUNTY.

The Greene Con. M. Co. will put in a long-distance telephone line from Naco to the Canoneas, a distance of 35 miles.

GILA COUNTY.

At Troy, the Davis shaft on the Ninety-one, down 190 feet, is being sunk to the 300-foot level; three eight-hour shifts are working.——The Band B. shaft on the Last Chance is being sunk to connect with the Davis shaft at the third level; two shifts are working.——The Black Warrior Copper Co., Amalgamated, has fifty men working on the Black Warrior.——A hoist will go in on the Black Copper soon and work will be pushed.

A strike of gold-silver-lead ore is reported made near Dripping springs.

GRAHAM COUNTY.

A new 10-stamp mill is going in in the Carlisle district, near Duncan.——A 6-foot vein of sulphide ore is reported opened up on the Stewart group, near Clifton.——The Fort Bowie M. Co. is pushing work on its property near Fort Bowie; a cyanide plant will probably be put in next spring.

Hitchcock & Faull will soon begin work on copper properties below San Carlos.

MARICOPA COUNTY.

The Wild Horse M. Co , capital $2,000,000, is incorporated at Phœnix.

MOJAVE COUNTY.

K. St. Charles has men taking out ore at the Midnight, at Kingman; a whim is used for hoisting.

The new belt for the Merrimac mill, at Chloride, is in; the mill is running on ore from the Minnesota.——The machinery for the Tennessee mill will soon be in place; No. 2 shaft will be sunk to the 500-foot level.——The Mollie Gibson has resumed; shaft will be sunk to 300-foot level; drifting will then begin.——The Elkhart Co. has resumed operations.——Work on the Minnesota and Connor shafts of the A. & P. M. Co. is progressing.——The New England & Arizona M. Co. will put in machine drills in the Sheeptrail and Homestake mines, Kingman.——The Oro Plata is closed down temporarily.——Work on the Gem and C. O. D. mines will resume after Jan. 1st.

Mensch & Davis are running a tunnel in the north end of Wallapai mountain.

YAVAPAI COUNTY.

G. W. Hull is pushing work on the Jerome, at Jerome.

The Verde Queen smelter, at Jerome, Supt. King, is turning out one ton of bullion per day.——Sinking is in progress on the Little Daisy, Supt. Powers.——On the Eclipse group, in Cherry Creek district, work is progressing with good results.——A 4-foot ledge is opened up on the Joe Dandy, of the Orissa group, adjoining the Eclipse.——A new shaft will be sunk on the United Verde mines; the new furnace will be of 400 tons capacity.——Good ore is taken from the Black Warrior in Grapevine district.——The Cobre Grande litigation is settled; the Greene people will take the stock at or nearly at par, which is $2.50, and will pay cost of litigation.——The International Financial Co., of New York, is pushing work on its group, in Black canyon, 8 miles south of Jerome; the company will drive a 200-foot tunnel.

The Venture Hill M. Co. has bought the 101, 102 and 103, near Jerome.——The Amalgamated G. & C. M. Co., operating the Kicker, in Big Bug district, will equip the mine with air drills and will push work.——The shaft on the Rebel, adjoining the Kicker, is down 400 feet.

YUMA COUNTY.

Supt. Mudesbach is pushing work on copper properties 18 miles northeast of Tyson.——The main shaft on the La Fortuna, at Fortuna, is down 995 feet.

CALIFORNIA.

AMADOR COUNTY.

The Muldoon at Jackson is bonded to G. F. Dyer of San Francisco.

The shaft on the Peerless, Jackson, is down 550 feet; Supt. Jackson. Two 250 H. P. compressors and a 60-stamp mill will go in on the Fremont next spring.

The new engine at the Central Eureka, Sutter Creek, is in, and ten stamps are dropping.——Operations on the Bay State, at Plymouth, will begin March 1st.——Supt. Downs of the Bunker Hill M. Co. reports the shaft unwatered and retimbered 700 feet; 100 feet more remain to be retimbered, sinking and drifting will resume.——The Gwin clean-up for November is said to have been $46,000.

Supt. W. Dennis is pushing work on the Free American, 6 miles east of Sutter Creek; sinking is in progress on the Tucker shaft.

The State Supreme Court this week confirmed the recent judgment of Judge Nichols in the Argonaut-Kennedy case in favor of the Argonaut.

A crosscut to cut the main ledge is run on 400-foot level of the Mutual, Sutter Creek, S. R. Porter, Supt.

BUTTE COUNTY.

A new drilling machine goes in at the Continental dredger, near Oroville.

Supt. Anderson, of the Feather River Oil Co., now drilling near Oroville, reports striking gas at a depth of 65 feet.

CALAVERAS COUNTY.

Work on the Big Horn, at San Andreas, is progressing.——Harrington & Vandel have leased gravel diggings in Chili gulch.——The Mountain King, at Hodson, is closed for the winter.——Seventy-five men are working on the Wright & Lane dam, near Hodson.——The Pocket (quartz and gravel) on French hill near Mokelumne Hill, is leased to Mr. Ogden, of Redding, for ninety days.——From 155 assays on ore from east vein in the South Carolina, of the Melones Con. M. Co., at Robinson's Ferry, Supt. Ralston, an average of $3.36 per ton was obtained.——The Golden Crystal, at West Point, is bonded to L. Lee; work will be pushed.——New machinery will shortly go in on the New Lightner (gravel) near Copperopolis.——Work on the Big Bonanza, Angels, is temporarily suspended on account of water; larger pumps will be put in and work resumed.——The tunnel on the Addison is in 85 feet.——Work on the Defender, West Point, is resumed under Supt. and owner, F. B. Joyce.——The tunnel on the Mahala, at Rich Gulch, has opened up a good sized vein at a depth of 230 feet.——J. Levaggi, of Plymouth, has bonded the Acme, near West Point.——The Oriole, at Angels, is closed down until larger pumps are put in.——The 26-inch pipe, which will feed the wheels at the Cross shaft powerhouse is in.

There are 179 feet of water in the Oriole, at Angels.——The Gold Cliff has resumed.

W. B. Lake will soon begin work on his placer tunnel near Eho; pipes and monitors are in.——Work on the Lost Boy is being pushed by Supt. U. J. Hussey; hoisting plant is in, and sinking in progress.

The Buffalo Con. M. Co. is pushing work on its group on the Royal mine lode, in Salt Spring Valley.

EL DORADO COUNTY.

At the Hart Con., near Georgetown, work on the new mill and building goes on.

HUMBOLDT COUNTY.

The Newberg mill, near Fortuna, is closed down for the winter.

INYO COUNTY.

The 6-stamp mill of the Mineral Hill M. & M. Co., at Ballarat, is running.——The King Con. M. Co. will probably put in a mill.——The Ratcliffe is closed down; it may be sold soon.——Ore from the Tuber is reported to run $25 to the ton.

The Inyo G. & C. M. Co., at Inyo, is shipping ore.

KERN COUNTY.

The Arcola Oil Co., operating on 1, 11-24, at Sunset, struck oil at a depth of 650 feet recently; the well is producing 500 barrels oil per day.——The Golden Gate Oil Co. has struck oil sand in its well on 34, 12-24.——The Occidental Oil Co., on 2, 11-24 is putting in new tanks.——The Monarch Oil Co. has completed two wells, and pumping same.

The Mt. Diablo Oil Co. will begin drilling in the Midway on section 26, 32-23, near Bakersfield.——Chanslor & Canfield will put in two rigs in the Midway and begin drilling.——The well on the Senator is down 1123 feet, the deepest in the Kern river district.

C. L. Buckingham of Denver, Colo., has prepared plans for a 50-ton mill for the Exposed Treasure G. M. Co., at Mohave, which will be provided with stamps, amalgamating plates, cyanide equipment and concentrating tables, the power to be supplied by gasoline engines. Mr. Buckingham will supervise the construction.

The Lida, in Rosamond district, near Mojave, is reported sold to Los Angeles men for $100,000.

LOS ANGELES COUNTY.

The Westlake Oil Co. is drilling on Nos. 42, 43 and 44, at Los Angeles.——The California Standard Oil Co. has completed its No. 3 well; it is producing seventy-five barrels oil per day.——Well No. 4, of the Uncle Sam Oil Co., is down 200 feet; over 100 feet of oil is in the well.——The College Oil Co. has completed twenty wells, and is drilling on No. 21.——The Yukon Oil Co. has begun work on another well near Nob Hill.——Shirley & Co. are drilling on No. 6 in Belmont park.——Phelps & Co. have completed their No. 2 well.——The Union Jack Oil Co. has put in machinery on the No. 3, and is drilling.——Well No. 2 of the Union Petroleum Co., corner of Ramona and Alpine streets, Los Angeles, is producing.

The St. Louis Oil Dev. Co. is drilling on St. Louis street in Boyle Heights, Los Angeles; the well is down 400 feet.

The Reliance Oil Co. will drill two wells on its Welcome street property.

MADERA COUNTY.

A Huntington mill is to be placed on the Five Oaks, or McFarland, mine, adjoining the Waterloo.

The new mill on the Magnet mine is running, likewise the Standard and Mud Springs mills.

The Boulder mine, near the old Zebra property, is said to show good ore.

Gold, Dec. 16.

MARIPOSA COUNTY.

Work is being pushed at the Virginia mine and mill, at Coulterville; 30 men are employed.

NEVADA COUNTY.

The Julia, Grass Valley, is reported bonded to San Francisco men; 300 feet of drifting will be done.

Thirty stamps are dropping at the Gaston Ridge; fifty men are employed.

The tunnel on the Inskip, Gold Run, is completed.——The shaft at the Three Stars, Ophir, E. J. Kendall Supt., is down 1100 feet; sinking is in progress.——The Houchin & Dixon is shipping ore.

W. J. Britland is pushing work on the old Anderson (quartz), at Selby Flat; ore recently ran $42 to the ton.

The old Constitution, near Rough and Ready, will be put in shape to resume.

The Orleans M. Co. of Grass Valley district has levied an assessment of 3 cents per share, delinquent Jan. 19.

PLACER COUNTY.

The Hidden Treasure Gravel M. Co., Supt. C. D. Akers, has 175 men employed; 500 cars of gravel are taken out daily from the blue and white channels; in the former a 1200-foot gangway is run; a 32-foot shaft is sunk; latter is supplied with an electric hoist; a 700-foot upraise up channel is being made; a new 10 H. P. electric motor to run blower is in.——W. Muir has men working on the Sacramento (gravel), at Forest Hill.——The tunnel at Peckham hill is in 100 feet.——The tunnel on the Sellier, at Bath, is in 800 feet; a new mill will go in soon; Washington G. M. Co., owners.——F. A. Elster has leased the Trafton (gravel), at Yankee Jims.——C. Lovell is running a bedrock tunnel on the St. George.——Parmelee Bros. are pushing work on the Bishop, at Last Chance.——The tunnel of the El Dorado (drift) is in 3000 feet.——The undercurrent, 1½ miles from the mouth of Greenhorn, 4 miles from Colfax, is completed.

SAN DIEGO COUNTY.

Drilling on the Monarch is resumed.——The San Diego County well is down 660 feet.

SAN JOAQUIN COUNTY.

The Victor G. M. Co., capital $250,000, is incorporated at Stockton.

SANTA CRUZ COUNTY.

A coal vein 12 inches wide was opened this week by the Cardiff Co. at Love creek, 15 feet from the mouth of the tunnel.

SHASTA COUNTY.

Additional stamps will be dropping soon on the American.——Watson & Brown are working the Halcyon with good results.——Weil & Malm have bonded the Fox & Espy group, on the east fork of Clear creek. The ore runs $9 gold, $28 silver and over 7% copper per ton.

The machinery for the Shasta Con. Oil Co., Redding, is on the ground. Construction work will be pushed. The plant consists of a 36 H. P. boiler, a 23 H. P. engine, belting, drilling bits, etc.

V. Fox and others are pushing work on the Shafter, at French Gulch.——A strike is reported on the Martha Washington. Ore is being sacked for shipment.——Operations on the old Milkmaid will resume. The shaft will be pumped out.——Pierson & Dryar, leasing the old Washington, are running 100 tons of ore through the old Washington mill.

SIERRA COUNTY.

C. H. Molter is working the Strassner (quartz), 2 miles south of Poker Flat.——Operations at the Twin Eagles, at Gold Point, are resumed; ore is being taken out and mill will soon run; J. S. Wilbur, Supt.

The Independence, on Wolf creek, near Downieville, is being pumped out.——The mill at the Triple Pocket, in Slug canyon, is running.

SISKIYOU COUNTY.

Work is progressing on the Trapper copper mines, in the Yellow Buttes.——New giants are in at the Beaudry South Fork mines, near Callahan.——H. Miller is pushing work on the Bonanza group.——Two giants are working night and day at the Red Hill (hydraulic), in Salmon River district.——An 8-inch vein of good milling ore is reported opened up on the LeRoy and Godfrey (quartz).——Two giants are running steadily on the Salmon River (hydraulic).——S. R. Gardner, lessee of the Hull Gulch placer, in Quartz Valley district, is hydraulicking on the property.——The Morrison & Carlock is running steadily.——Werst Bros. have begun operations on the South Park (gravel), near Cecilville.

An arrastra is in on the Barrington, near Callahans.

SOLANO COUNTY.

The St. Johns (quicksilver), at Vallejo, is reported bonded to a new company.

TRINITY COUNTY.

A new giant is in at the La Grange, near Weaverville.

TUOLUMNE COUNTY.

On the Nonpareil, Big Oak Flat, drifting is in progress on the 150-foot level.——At the Longfellow an additional ten stamps will go in; the cyanide plant is running.——The Riverside, at Columbia, is temporarily closed down while new machinery goes in.——High-grade ore is reported opened up in a crosscut on the 400-foot level of the Dreisam.——The 10-stamp mill at the Silver King, Sonora, is running.——Supt. F. Vassalo Jr. is pushing work on the Tug of War, at Columbia.——Electric power may be used in the mines at Big Oak Flat.——Doyle & Oakes have bonded the Darrow, at Rawhide.——The 10,000-foot pipe line to the site of the new 100-stamp mill that will be erected at the Shawmut next spring is about completed.

Work on the Barry, at Carters, is resumed.——Sinking is resumed from the 900-foot level of the Providence.——In the east crosscut on the 200-foot level of the Laurel $30 ore is reported opened up.

Cerro Gordo Union, W. F. of M., No. 39, has called a strike of the employes in the Longfellow and Nonpareil mines, at Big Oak Flat, claiming that the management has cut the pay of the employes.

VENTURA COUNTY.

The Western Union Oil Co. is down 1600 feet on its property on the Carreaga ranch, near Santa Paula.——The Whittier-Fillmore Oil Co. has struck oil at a depth of 620 feet.——In Timber canyon the Empire Oil Co. has completed its No. 9 well. The latter is producing twenty barrels of oil per day.——The Windsor Oil Co. has resumed drilling in Timber canyon.——Langdell, Rowan & Newmark are down nearly 1400 feet, with a 5⅝-inch hole, on Sulphur mountain.——The Whidden Double Oil Co. is down 150 feet on well No. 4 on the Bracken tract. No. 3 is yielding seventy-five barrels of oil per day.——The Home Oil Co., operating on the Hobson tract, south of Santa Paula, struck oil sand recently at a depth of 400 feet.——It is thought that Ventura may be chosen as the site for the largest oil refinery on the Pacific coast, which will be built as a result of the sale of the Pacific Oil Co. to the Standard Oil Co.

YUBA COUNTY.

The plans for the construction of restraining barriers along the Sierra foothills, for which the State and Federal Governments have made large appropriations, may now be carried out under the terms of a decision this week by Attorney-General Ford. Under the California Debris Commission Act of 1897 an appropriation of $250,000 was made, and Congress set aside a like sum for the purpose, making a total of $500,000 in all. The plans of the Federal engineers engaged called for an expenditure of $800,000, and the State Board of Examiners, being restricted in its jurisdiction to plans involving an outlay of no more than $500,000, feared to lend its approval to the plans. The attorney-general calls attention to the fact that a subsequent Act of Congress provides that the Federal engineers may proceed with the work to the extent of $500,000, leaving the remainder in abeyance, awaiting further action of Congress or the State Legislature, and declares that the plans and specifications for this expenditure of $500,000, afterwards submitted, may properly receive the approval of the State Board.

COLORADO.

BOULDER COUNTY.

A strike of high-grade tellurium ore is reported in the Gladiator, near Jamestown.——The shaft on the Fourth of July, in Arapahoe Peak district, is sunk to the 240-foot level. The Nellie Bly mill, at Magnolia, is to resume; a new roaster is going in; capacity 80 tons per day; Heresey M. Co., of New York, owners.——The shaft on the India is down nearly 180 feet; an additional 100 feet will be sunk.

The Ruby mill, Ward, will soon run on ore from the Silent Friend.——The B. & M. Co. will overhaul and put the old Boston mill in shape to run.——The Big Five Co. is pushing work on the Dew Drop. The Silver Lake M. Co. is putting in a shaft house, ore bins, etc.; machinery will go in as soon as building is completed.——The B. & M. Co. recently made a strike on the 600-foot level of the B. & M.——Sinking is in progress on the 600-foot level of the Superior.——The tunnel of the Leviathan M. Co., being driven into Left Hand mountain, is in 700 feet.

The Wood Mountain M. Co. is down 900 feet on the No. 1, and 1000 feet on the Franklin, at Wall Street; the company will, after January 1st, continue the crosscut, now in 1500 feet, to cut the Joe vein.——C. W. Carlyle is pushing work on the Wall Street group; thirty men are employed.——A new plant, shaft house and ore house are in on the Gold, G. A. Blaisdell, manager; shaft down 100 feet, and drifts east and west are being run at that depth; sinking will continue to 200-foot level.——On the Sugar Loaf, the shaft is down 220 feet; a 250-foot tunnel is run on the 100-foot level; Supt. L. R. Johnson.——The Lucky Star is shipping steadily; shaft is down 320 feet, with levels run at 100, 150, 200 and 300 feet; drifting east and west is progressing on the 300-foot level.——The tunnel on the Concord is in 175 feet.

Conger & Wannamaker, operating wolfram mines, near Nederland, have produced $5000 within the last two months.

CLEAR CREEK COUNTY.

Two shifts are working on the Oro Verde, at Yankee, and Manager Goodyear is pushing work.——The 8x8-foot tunnel on the Mayflower is in 150 feet; it is expected to cut the Puritan vein at the 800-foot mark; electric drills are being used; water is being piped from St. Mary's lake for motive power.——Roberts Bros. are putting the Micawber tunnel in shape to resume operations.——The lessees on the Sierra Nevada intend to begin shipping ore soon.——The Ninety-four Tunnel M. Co. has put in a pipe line from the lake to the new mill.——The tunnel on the Lombard will be driven several hundred feet during the winter.——Sinking is in progress on the Cumberland; shaft, now down 50 feet, will be sunk to 150-foot level.

Arrangements are being made to resume operations in the Atlantic-Pacific tunnel, Georgetown; retimbering of tunnel and putting in of a new plant will probably be done first.——The Clear Creek M. & Reduction Co., capital $500,000, is incorporated.——A 12-inch ledge of galena is reported in the Red Oak.

The tunnel on the Hansborough, Georgetown, is in 400 feet; it will be continued to cut the Cliff vein, from 450 to 500 feet distant.——Ore running $40 to the ton is reported opened up in the Cashier.——Work on the Kelly tunnel is progressing.

A company is formed to work the Abeel property, on Covode mountain, near Empire.

The Red Oaks Co. will push work on the new tramway, at Georgetown, upon arrival of the cable.—The Bismarck is shipping regularly.

The Griffith, Georgetown, is reported sold to H. P. Tweed of Denver for $60,000; work will be pushed.——J. Connors & Co. are sinking on the Mineral Chief.

CUSTER COUNTY.

The November pay roll of the Bassick, at Silver Cliff, was $18,000.

FREMONT COUNTY.

All departments of the new Union mill at Florence are completed and running.

The Portland cement works, 8 miles east of Florence, are temporarily closed down; operations may resume Jan. 1st.

GILPIN COUNTY.

A new hoisting plant will be put in on the Fish group, on Montana hill, near Pine creek.

GUNNISON COUNTY.

Three shifts are working at the Enterprise, at Italian mountain. The ore is being shipped to Aspen.——W. Miller is pushing work on the Yukon, in Taylor gulch.——It is estimated that the tunnel on the Little Lily, now in 175 feet, will have to run another 50 feet before striking ore.——At the Star three shifts are working.—— The new furnace for the smelter at Placita is going in.——The new West Mountain compressor, at Pitkin, is in.——The tunnel on the Gold Links, now in 60 feet, will be driven an additional 100 feet.

HUERFANO COUNTY.

The Western M. M. & Ref. Co. is incorporated to work oil lands near Walsenburg.——Near Muddy, the tunnel being run into Mount Blanca is in over 800 feet; thirty-five men are employed. Work is being pushed on the Scantic, on Carbonate hill.

JEFFERSON COUNTY.

F. R. Carpenter and others have started work on the new smelter at Golden.

LAKE COUNTY.

After the expenditure of nearly $200,000 on the Adams, Maid and Wolftone lease, for hoisting, pumping and milling equipment and putting the underground workings in good condition, this group, which is under a 10-years lease to the A. M. & W. Leasing Co., is now ready to begin operations on a considerable scale, both in production and development. The group comprises three distinct properties, with a deep shaft on each, and after Feb. 1st next the Mab mine, which adjoins on the north, will become a part of the main group, all under the management of S. D. Nicholson. The underground workings are all connected and the Wolftone shaft will be the center of operations. The hoist, boilers and gallows frame here have been previously described. A dynamo has been put in to supply light to the mines and the top premises. The water is handled by two Knowles duplex, triple-expansion pumps—one at the 700 and the other at the 1000-foot station. At present 1000 gallons are being handled. At each pump station the water is bulkheaded and connected with the pumps by a 12-inch suction pipe. At this shaft the sulphide ledge was struck at depth of 700 feet. The present depth is 1100 feet and sinking continues, with the idea of entering a contact at greater depth. A sinking pump follows the work down, handling the increasing flow of water.

Within the last few months the A. M. & W. management has equipped a concentrating mill on the premises, which at present is handling eighty tons of ore per day. This ore, while it comes from the Wolftone proper, comes through the old Adams shaft. Three mills crush the ore to a uniform mesh, the material being separated by hydraulic sizers, the coarser and heavier passing direct to six Wilfleys, the slimes passing to six cone-shaped settlers provided with overflow gates; the settlings run through to other concentrators there being one table under each settler. The overflow from the settlers passes to a series of settling boxes, where a final slime product is obtained. A vibrating conveyor delivers the concentrates from the tables to the shipping bins. By this method of separation two products are obtained, viz.: a lead-iron with small per cent of zinc and a purely zinc product, which runs about 45% of that metal. A Bartlet table is being added to make further concentration tests.

Leadville, Dec. 15. WASCOTT.

MESA COUNTY.

The Western Slope C. M. & S. Co. is pushing work on the Nancy Hanks, in Unaweep district, 12 miles from Whitewater.——The Unaweep C. M. & M. Co. has put in a new hoist on the Mollie Brooks and expects to ship ore.

OURAY COUNTY.

At the Virginius mine and Revenue tunnel of the Caroline M. Co. the shaft, which starts near the breast of the 7500-foot tunnel, has reached a depth of 650 feet, and the intention is to sink to 1000 feet depth, which it is expected will take it into the quartzite. This shaft starts on the hanging wall side of the Virginius vein, cuts through the latter at 550 feet depth, and the work is now in foot wall. Stations have been cut 200 feet apart and it is the intention later to crosscut from each station to the vein. Present depth of this shaft gives a vertical depth on the vein of 4000 feet. The steady production of about 200 tons per day for the past few years has come from above the level of the Revenue tunnel, and so far as can be seen the same general character of ore is maintained from the upper workings down to the point where the tunnel shaft cuts through the ore body. In the shaft above described a cage will soon be operated by a 100 H. P. electric hoist, which has been ordered. About 100 gallons of water per minute comes in, which is handled by an electrically operated station pump.

L. Chelders is developing the Black Diamond group, in Yankee Boy basin, near the foot of Mt. Sneffels. He is uncovering some large bodies of low-grade iron-lead-silver ore.

Sneffels, Dec. 18.

Manager West of the new Home smelter expects to start Jan. 1st.

SAN JUAN COUNTY.

Work on the development tunnel on the Estes Wire Works properties, in Eureka gulch, near Silverton, is suspended for the winter.——The Sioux M. Co., Eureka, will put in a mill next summer.——Manager T. Kane is pushing work on the Hercules, Silverton. The mill is running steadily and is turning out two carloads of concentrates daily.——Strayer Bros. are driving a 300-foot crosscut on the Sentor, on Mineral creek.

The Silverton smelter is putting through from 85 to 100 tons of ore daily.——The Champion No. 2 is shipping ore to the smelter.——The new trackage and air pipe are in at the Fairview, on Sultan mountain.——The North Star–Dives–Shenandoah Co. is pushing work on its property on Solomon mountain.——The crosscut on the Keystone, in Poughkeepsie gulch, near Eureka, is in 80 feet.

J. F. Melvin has leased the Emerald, on Anvil mountain, near Silverton.——The Idaho is shipping regularly.——Good ore is being taken from a drift on 800-foot level of the Washington.——A 3000-foot crosscut is being run on the Mountain Lion, between Red Mountain and Ironton.——The Ben Butler, San Juan Chief and Little Maud, at Mineral Point, are being worked by the L. B. Jackson M. Co; L. B. Jackson, manager.——The crosscut on the Prairie, now in 700 feet, will be driven an additional 400 feet.——Stoping is in progress on the Evening Star, in Mastodon gulch; the main tunnel will be driven 150 feet to tap the ore body.——The Yukon mines and mill are running day and night under Supt. A. A. Lamont.

SAN MIGUEL COUNTY.

At Ophir, Greig & Jarrett are pushing work on the American-Frenchman group.——The Four Metals Co. is shipping ore.——The Butterfly is producing 1500 tons ore per month.

The last report from the Tomboy, at Telluride, shows work done, as follows: Drifts on vein, 2401 feet; raises, 1103 feet; crosscuts, 152 feet; shaft sinking, 109 feet; it is said that there are 50,000 tons of ore in sight over the 300-foot level.——The Adams G. M. Co., capital $100,000, is incorporated to work the Thomas group, in Bear Creek basin.——A controlling interest in the Waverley, Cripple Creek, is bought by W. R. Foley and others; a new plant will go in, and sinking on the Strong vein will be pushed.——The Golden Wedge, on Raven hill, has passed into control of the Mary Jane Co., recently incorporated. —— Three-ounce ore is said to have been opened up recently on the 200-foot level of the Home, on Beacon hill.——Consolidation of the Doctor, Jack Pot, Ingham, Morning Glory and Nugget properties, on Raven hill, Cripple Creek, is reported; capital, $3,000,000.——The Bison, south of Altman, has suspended operations, owing to inflow of water.——The Eagle Sampling Co. will put on another shift; storage bins will be enlarged.——A new vein is opened up on 344-foot level of the Kimberley, Cripple Creek.——A Cincinnati Co. is driving a tunnel into the north slope of Pike's peak, 3 miles southeast of Lanter; machine drills are used; mouth of tunnel is above timber line at an altitude of 11,000 feet.

Work on the Silver Bell at Ophir is progressing; operations on a large scale will soon begin.——On the Staatsburg, 200 feet of drifting is completed; 100 feet additional will be done.——An electric drill will go in at the Deadwood; the tunnel will be driven between 700 and 900 feet.——A tram and milling plant may go in on the Gertrude soon.

SUMMIT COUNTY.

Bulkley Bros. have organized the New Robinson M. & S. Co., the purpose of which is to reopen and operate the old Robinson mine, near the town of Robinson, which was a great producer in former years. The property comprises a group of seventy-five acres. It possesses large bodies of low-grade iron pyrite ores, carrying gold and silver. Shipments now amount to fifty tons per day of lead ore, which comes from another section of the property, whose ores are of a different character. Plans are being made by them to erect a one-furnace smelter on the ground.

Robinson, Dec. 18.

TELLER COUNTY.

Cone & Robinson of Canyon City have sold the Doctor mine, on Raven hill, to A. E. Carlton and associates, the latter having organized the Doctor-Jack Pot Con. M. Co., which effects a consolidation of the Doctor, Jack Pot, Elizabeth Cooper, Ingham and other properties on Raven hill. The capitalization of the new company is $3,000,000, being 3,000,000 $1 shares. Holders of Jack Pot stock and that of other properties in the consolidation will get a certain proportion of the new stock issue. This is an important group; it is contiguous to the Work group. The directors of the new company are A. E. Carlton, W. P. Bonbright, J. H. Hobbs, H. E. and F. M. Woods and A. M. Stevenson.

Cripple Creek, Dec. 18.

Spratt Bros., leasing the Brownlee & Milliken block of the Kimberley, Cripple Creek, have made air-pipe connection with the compressor on the El Paso adjoining.——A new plant will go in on the Little Diamond, on Battle Mountain; at a depth of 40 feet, $60 ore was recently opened up.——Stattler & Baer, leasing the Snowy Range, on Raven hill, recently made a 20-ton shipment of two-ounce ore; drifting is in progress.——The 20-foot ore body recently opened up in the Ophelia tunnel is cut from third level of Burke & Frye's lease on north end of the Mary McKinney, other levels will be extended to the shoot.——A recent 11-ton shipment from the Iron Clad, on Iron Clad hill, returned $62 to the ton.——A crosscut is being run on the 90-foot level of the Woodman, on Rosebud hill, to tap the Mary Nevin vein.

IDAHO.

ADA COUNTY.

E. H. Levy will build a sampling plant in Boise; it will include a smelter of small capacity, a stamp mill of ten tons daily capacity, and a small chlorination and cyanide plant.

BLAINE COUNTY.

The new 20-stamp mill for the Hattie, Hailey, will be built this winter; the mill site is being graded and lumber is arriving.

BOISE COUNTY.

The mines at Pearl, 25 miles north of Boise City, are reported producing $50,000 per month.

The American Girl (quartz), 8 miles northeast of Idaho City, is bonded to the War Eagle Co.; a tunnel will be run on the property.

A 400-foot crosscut tunnel is being driven on the Sam Johnson group, near Quartzburg, recently bought by the Dixie M. & S Co.——A self-discharging arrastra is completed on the Present Need; a tunnel is being run to tap the ledge at a depth of 400 feet.

CANYON COUNTY.

Near Payette a 750-foot tunnel will be run to drain 2 miles of the Payette river, to work the gravel beds; a gasoline engine, two sets of drills to be run by electric power and a dynamo will go in; twenty men will be put on at first.

CUSTER COUNTY.

The Yankee Fork group (quartz), Estes mountain, near Hailey, is reported sold to C. N. Thayer of Boston, Swift of Chicago and others for $100,000.

Instead of cleaning out the old shaft, the Lucky Boy M. Co. will sink a new 200-foot shaft on the Lucky Boy at Custer.

IDAHO COUNTY.

Work is under way on fifty claims on Buffalo Hump. The Buffalo Hump Co. will put in thirty additional stamps and concentrating tables; 100 men are employed; shaft on the Big Buffalo is down 250 feet; drifting and stoping are in progress on the 200-foot level; shaft on the Vesuvius is down 150 feet.——The Wise Boy, near Callender, has six men working.——The Boston & Buffalo–Idaho Co. will put on more men at the St. Louis and the Mother Lode No. 2 and will push work; it is reported that new machinery will go in on the St. Louis and that a 150-foot shaft will be sunk.

The Little Giant, at Warren, recently sold to the Idaho Little Giant M. Co. for $100,000, has fifteen men working; an air compressor and two concentrators are in; ten stamps are dropping; W. H. Hill, manager, J. J. Bennett, Supt.——Work on the Silver King is being pushed; ten men are employed.——The Rescue is being put in shape for a run.——Tilson, Matthews & Myers are pushing work on the Iola.

OWYHEE COUNTY.

The Pauper M. Co. will begin operations on the Pauper, at Silver City, Jan. 1st; the shaft, now down 525 feet, will be sunk to 700-foot level.——There are 500 men mining in the vicinity of Dewey.

SHOSHONE COUNTY.

Gillilland, McNall & Oxley are pushing work on their placers near Delta; two booms are running night and day.——H.

W. Fehling is running his boom steadily with good results.——Busen & Brooks are working a portion of the Myrtle.——Maher & Tozier are putting in a flume and ditch in American gulch.——Output in tons of mines at Gem is given as follows: Morning 800, Frisco 800, Standard 500, Crown Point 200, You Like 280; about 1100 men are employed, divided as follows: Frisco 325, Standard 300, Crown Point 125, Morning 350; the deepest shaft is on the Frisco—2200 feet.

The Murray D. Co. has bought the Mother Lode near Murray; a new mill will probably go in next summer.

The Mullan M. Co. has resumed work on the Lucky Friday, 4½ miles east of Mullan.

The Cœur d'Alene M. Co., capital $200,000, is incorporated at Wardner.——The Ruth M. Co. will work the Ruth, near Wallace, through the winter.

WASHINGTON COUNTY.

The Boston & Seven Devils M. Co. will push work on its copper properties in Seven Devils district next year.

MICHIGAN.

HOUGHTON COUNTY.

The new stamp mill at the Quincy, Houghton, is running; daily capacity, 1500 tons ore.

MONTANA.

DEER LODGE COUNTY.

The Bell, Diamond Mountain, Consolidated and the Green Mountain, at Anaconda, have resumed operations; about 1500 men are employed.

MADISON COUNTY.

W. J. Miller is working the Uncle Sam, on Mill creek, near Sheridan.——The Centennial Toledo Co. will sink a 100-foot shaft on the Centennial Toledo, at Brandon.——The Keynote will begin shipping ore soon.——The Watsega M. Co. will sink a new shaft on the Watsega, at Rochester; it will also equip mine and mill with electric lights.

SILVER BOW COUNTY.

Work on the B. A. & P. tunnel to the Gagnon will be completed Feb. 1.——The new Wyoming–Broadway electric line, Butte, will be running Jan. 15. Ore traffic will be on from 10 P. M. to 8 A. M.

NEVADA.

ESMERALDA COUNTY.

An 18-inch ledge of rich sulphuret ore is reported opened up on the Wilson at Pine Grove.

EUREKA COUNTY.

A recent shipment of eighty and one-half tons of ore from the Rocco-Homestake, at Eureka, returned $2682.15 (net), or $33.32 per ton.

HUMBOLDT COUNTY.

It is locally reported that additional smelters and a new mill will be erected at Golconda by the Glasgow & Western Co., Manager Stalmann.

J. T. Reid is shipping nitre from his beds near Lovelock to the American Nitre Co., Berkeley, Cal.

LINCOLN COUNTY.

The Green Monster, Supt. Wilkinson, is shut down.

Since the Los Angeles & Salt Lake R. R. is an assured fact, prospectors are looking over the country on the proposed line of the road. Some very good copper ores are being found, especially in southeastern part of Inyo county and northeastern part of San Bernardino county, California, and north of Las Vegas valley, Lincoln county, Nevada.

The plant built by the Mineral Union Co. at Goodsprings for the lixiviation of copper ores by the "Ammonia Process," under the direct supervision of the inventor of the process, Professor H. Hirsching, will be sold next month under attachment by C. A. Beck. Bowen & Green have incorporated as a stock company. So far, copper properties have held the attention of investors; now lead properties are being bonded. Messrs. Smith & Bybee have bonded two lead properties to Los Angelenos.

Goodsprings, Dec. 19.

The Horseshoe, at Fay, is shipping gold cyanides to Salt Lake.

LYON COUNTY.

H. R. Case, representing a Denver company, is sampling tailings in the Douglass reservoir below Sutro; should tests prove satisfactory, the company will probably handle the tailings on a large scale.

STOREY COUNTY.

At the Gould & Curry, Virginia, the day and night shifts are laid off owing to a contemplated change in the management; ore in hand will be crushed, and a clean-up made.

Repairs are being made in the perpendicular shaft of the Belcher, Virginia.——The south drift from the upraise, 100 feet above drain-tunnel level, on the Justice, is in 64 feet.——At the Challenge-Confidence-Imperial repairs are made in the surface tunnel: the new air compressor is in, and it will run soon; crosscutting will soon resume.——The old Monte Cristo, near Six-mile canyon, is reported leased to J. Graham and others.

The west crosscut on 1800-foot level of the Con. California & Virginia is in 30 feet; on the 1950-foot level the winze in the old north drift is down 10 feet; 120 cars of ore running on a basis of $65 78 and 78 cars of ore running $22 03 were extracted during week ending Dec. 15th.——The Burning Moscow tunnel is in 175 feet.——The west drift in the Sutro tunnel (1700-foot level) is in 247 feet.——The west crosscut on the Central tunnel level of the Mexican is in 226 feet.——The Hale & Norcross tunnel is run 1912 feet.——On the Sierra Nevada, the south drift, started from the northwest drift at a point 387 feet from shaft, is in 30 feet; west drift on the 1600-foot level is cleaned out and repaired for 680 feet from shaft.——In the Chollar the main north drift on 900-foot level is cleaned out and repaired for 336 feet.——The south drift from main tunnel of the Potosi is in 216 feet; all workings are now lighted by electricity.——At the Silver Hill, the northwest drift is in 123 feet.——During the week ending Dec. 15, 100 tons of ore from stopes on 325-foot level were milled at the Gould & Curry, which returned $4.57 (coin value) per ton.——West crosscut No. 9 on 425-foot level of the Best & Belcher is in 89 feet.——On the Utah, surface tunnel No. 2 is in 788 feet; face in hard porphyry.

Electricity was substituted for steam power in the carpenter shop of the Chollar, Virginia, on the 13th inst.——Electrical machinery will go in on the Nevada by Jan. 1st.——At the recent delinquent sale of the Con. Cal. & Va. M. Co. only 2500 shares out of 216,000 shares were sold for non-payment of the assessment.

The Gould & Curry, at Virginia, is turned over to the new managers, Douglass & Shaw.

WASHOE COUNTY.

W. H. Jackson, of the Jumper, Olinghouse gulch, recently shipped thirty tons of high-grade ore to the Selby Smelting & Lead Works, San Francisco.——W. C. Williams contemplates a mill on the Gold Ledge.——Wadsworth Mill Co., Wadsworth, will put in two Kinkeads and a 5-stamp mill.——Three carloads of ore from the Reno Star, at Reno, recently returned $7760.67.

WHITE PINE COUNTY.

The Chainman mill, at Ely, is being put in shape to run. A combined amalgamation and cyanide process will be used. Twenty-five men will be employed.——W. Lawlor has men running a tunnel in Egan canyon, near Ely.

The first shipment of ore from the Jumbo group, 80 miles from Oasis, was recently made to Salt Lake, Utah; assays show 40% lead and 4.5 ounces silver per ton.

NEW MEXICO.

DONA ANA COUNTY.

The Lead Queen and Lead King mines, in the San Andreas mountains, near Tularosa, recently sold to the Salinas Peak M. Co. of Chicago for $100,000, are shipping ore.——R. Y. Anderson & Co. have resumed operations on the Ben-Nevis group.——Goodwin Bros. are working copper properties near San Andreas.——A new hoisting plant is going in on the Copper Bar at Organ. Work will be pushed.——In the breast of the 500-foot tunnel on the Flor de Mayo, Good Fortune canyon, in the San Andreas mountains, 35 miles west of Tularosa, a 3-foot vein of ore running $100 to the ton is reported opened up; Tipton Copper Co. owners, Manager W. S. Becker.

COLFAX COUNTY.

A new dredging plant will soon begin operations near Elizabethtown.

The Black Copper, at Elizabethtown, is closed down until the mill is up.——The Golden Era M. & M. Co. is pushing work on its new mill in Big Nigger gulch. There are eight coal mines in this county, employing 527 men, and turning out 399,206 tons of coal yearly, valued at $602,107.

GRANT COUNTY.

The San Jose Concentrating Co. will increase the capacity of its plant in Gold gulch from twenty-five to sixty tons daily. A new hydraulic sizer and two Bartlett tables are in.——P. T. McGrath of Silver City, Colo., has made the last payment on the Comanche group at Burros and will organize a company to work it.——The Pinos Altos M. Co. at Pinos Altos is sinking the Gillett shaft, now down 800 feet, to the 1000-foot level.——M. Waterbury of the Golden Giant M. & M. Co. of New York is pushing work on the Golden Giant and Mammoth properties. Twenty-five men are employed. The shaft of the Golden Giant, now down 450 feet, will be sunk to the 600-foot level, while the shaft on the Mammoth, down 300 feet, will go to the 500-foot level. The erection of a 40-stamp mill is postponed until sinking is completed.——The Deming M. & M. Co. at Deming is pushing work on the Maggie M., in Shingle canyon.

SANTA FE COUNTY.

A strike of high-grade gold ore is reported made in Madera canyon, near Algodones.——Work is progressing on the Maceo. A concentrator will be put in next spring.——Work on the new smelter at Algodones is under way.

SOCORRO COUNTY.

The Navajo M. Co., Pino, Cochiti district, projects a new mill on the property.

TAOS COUNTY.

The Copper King at Red River has resumed.——Work is progressing on the Black Copper.

The new June Bug mill at Red River, an amalgamation plant, with crushers, is expected to begin operations Jan. 1.

OREGON.

BAKER COUNTY.

Arrangements are about completed for a resumption of operations on the co-operative property near Sumpter.——A stamp mill is projected for the Carrol B., Pleasant Valley.——A 600-foot tunnel will be driven on the Diadem, Baker City.——The case of Finnegan vs. the Golconda M. Co. for $21,000 damages is decided in favor of defendants.——A ledge of ore running 15% copper is opened up on 60-foot level of the Free Silver at Mineral.——A 6-foot ore body is opened up in the 700-foot tunnel of the Golden Star at Baker City.——Work on the Jerome group on Little Beaver creek, near Alamo, will be pushed during the winter.

The Oregon Placer & Power Co. has put in new giants and pipe on the Griffith placers, near Baker City, and will push work on latter.

A strike of ore assaying $33.20 is reported made on the Leo, at Sumpter.

GRANT COUNTY.

The shaft on the Red Boy, at Granite, is down 500 feet; a new hoisting plant is in; 20 stamps are dropping and more will be added soon; 100 men are employed.

A strike of good ore is reported made on the Mayflower, near Susanville.

The shaft on the Red Rock group at Gold Center, near Granite, down 85 feet, will be continued to the 300-foot level; at this depth crosscutting and drifting will be done.——Work on the crosscut tunnel on the Buffalo, at Granite, is being pushed; Supt. R. T. Cox.

The Scandia M. & Tunnel Co. has ordered drills and an air compressor, and will begin work on the 3000-foot Aldrin tunnel which will penetrate Quebec hill, near Granite.

Work on the Quartz Gulch placer, near Canyon City, will resume soon.

JOSEPHINE COUNTY.

Supt. W. D. O'Brien is pushing work on the Old Channel, at Six Mile; three giants are in operation.——C. H. Parks operating the Golden Wedge, at Galice, reports a 5-foot ledge at a depth of 100 feet; mine was formerly known as the Hutchins-Kramer.——The Rocky Gulch placer has suspended operations temporarily on account of scarcity of water.——Reed & Larrabee of Helena, Mont., are pushing work on their quartz property on Forest creek, near Galice; a mill may be put in soon.

UNION COUNTY.

The Bird's-Eye group, near Sanger, is bonded to A. Freeman of Dallas, Texas.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Homestake Co. is credited with intention to build a large cyanide plant at the mouth of Bobtail gulch, near Central City, to treat tailings from the Caledonia, Deadwood, Terra and Father De Smit mills; the two latter are now being put in shape to run.——The Boston & South Dakota, in Blacktail gulch, is closed down for the purpose of building a 150-ton cyanide plant.

UTAH.

BOX ELDER COUNTY.

A recent week's run at the Century, Park Valley, returned a $1000 gold bar; Supt, D. H. Lynch.

Supt. P. H. Lynch is pushing work on the Century, at Park Valley.

IRON COUNTY.

A new reduction mill may be put in on the Ophir at Stateline, Manager F. H. Lathrop.

JUAB COUNTY.

Supt. Underwood is pushing work in the Carissa & Spy, consolidated; sixty men are employed.

Work on the Ridge & Valley, at Tintic, is resumed; the shaft, now down 600 feet, will be sunk to 800-foot level; drifting will then begin.——The Ajax is again running after a temporary shut down caused by fire.——Forty men are working on the Grand Central; ore is being shipped.

A tunnel is started on the Sultana group, West Tintic.

Ore from a cavity recently opened up between the 700 and 800-foot levels of the Mammoth, at Tintic, Manager Bamberger, assays fifty-nine ounces silver, $2.40 gold, and 3.7% copper per ton.——Four cars of ore from the Star Con., Manager Packard, recently returned $2266.42.

Shipments of ore from Tintic district for week ending Dec. 15 are as follows:

	Cars of ore.
Mammoth	17
Carissa	8
Crand Central	6
Ajax	1
Centennial Eureka	33
Godiva	2
May Day	3
Gemini	17
Humbug	1
Tesora	6
Swansea	5
Star Consolidated	4
Total	103

PIUTE COUNTY.

The shaft on the Park, of the Park G. M. Co., at Marysvale, is down 250 feet; crosscutting is in progress on this level.

SALT LAKE COUNTY.

The new concentrator of the Butterfield M. Co. at Bingham, is running.——Work on the Homestake and Eldora claims at Alta is being pushed.——The new working and drain tunnel on the Old Telegraph, now being driven from mouth of Bear Gulch, is in 200 feet; it is expected to cut the foot wall in 850 feet, at a depth of 500 feet.

On the New Sensation at Big Cottonwood, an ore body is reported opened up in the tunnel.——Good ore is opened up in the old Congress tunnel of the Winnemuck, Bingham, which, until recently, has lain idle for twenty years. The Dewey mill is running on a 200-ton lot of ore from the old Damphool tunnel of the Midland group.——The West Mountain M. & M. Co., operating the Kansas group in Freeman gulch, Bingham, is taking out good ore from Kansas shaft No. 1; ore shows 1½% copper, 9.7% lead, 225.2 ounces silver, and $1.20 gold per ton.——By Jan. 15th the Provo canyon electric plant will be supplying Bingham mines and mills with electric power.——Upon inauguration of electric power into Bingham, the Fortune and Shawmut mills will probably start up.

A vein of galena, one-half foot thick, yielding 20% lead, 3% copper, and from six to ten ounces silver to the ton, is reported on the York, at Bingham, owned by the York M. Co.

The Silver Shield, Bingham, will ship several cars of crude ore and concentrates the end of this month.——By the end of 1901, it is thought probable that the United States Co. will have a 500-ton smelter running.——The Last Chance mill is turning out about five tons of concentrates daily.——The tunnel on the Admiral Schley, Nos. 1 and 2, is running through ore, which assays 4% to 6% copper, eight ounces silver and $2 gold per ton.——Supt. Dugan is pushing work on the Little Cottonwood tunnel, now being driven to cut the I. X. L. and Jersey Blue vein.——Fifteen men are employed at the Shawmut on development work.

SUMMIT COUNTY.

Machinery for the new King sampler, at Park City, is arriving, and construction work will be pushed.——A station is being cut on 1600-foot level of the Ontario.——Following are shipments of ore from Mackintosh sampler for week ending Dec. 15:

	Pounds.
Daly-West	1,192,000
Silver King	967,000
Anchor concentrates	518,000
Ontario	209,000
Total	2,886,000

It is locally reported that the Centennial Eureka M. Co., Eureka, may buy the Eureka Hill, which adjoins the Centennial Eureka on the north; the Eureka Hill is equipped with steam hoist, a 100-stamp combination mill, etc.

TOOELE COUNTY.

The new concentrator on the West Argent at Stockton is running successfully; manager F. R. Ball.

UINTAH COUNTY.

The smelter at Vernal is running steadily. Operations at the Dyer were temporarily suspended recently, owing to a strike of employes.

WASATCH COUNTY.

The Josephine M. Co., capital $125,000, is incorporated to work the Sunflower and other claims in Elkhorn district.

WASHINGTON.

FERRY COUNTY.

Returns from a second shipment of ore—fourteen tons—from the Morning Glory, Republic, give $405 per ton, or a total of $5670. The ore was taken from the 200-foot level. A shipment of ore from the 250-foot level will be made soon.——The Copper Queen M. & S. Co., capital $50,000, is incorporated.

On the Flag Hill, Republic, 4 feet of ore is opened up in the north drift from the tunnel level. Work on the drift south from the winze will resume soon.

The Mountain Lion, Republic, is crosscutting for the main ledge; shaft will be sunk to 625-foot level.——The Quilp will probably begin shipping 100 tons of ore weekly; freighters ask $10 per ton.

Supt. J. L. Harper of the Hawkeye, on Lambert creek, near Republic, reports the shaft down 149 feet; a station is being cut on that level preparatory to crosscutting the ledge.

During November 223 feet of drifting was done on the Mountain Lion, Republic; a crosscut tunnel on the 425-foot level was run to cut the ledge.——At the Quilp an 8x15-foot raise is run.

Supt. M. Hodges of the Princess Maud is drifting on the 300-foot level.——The Quartz Cap has resumed.——The shaft on the Silver Dollar is down 70 feet; the ledge is drifted on 40 feet.——The Republic mill is running steadily.——Ore from the 285-foot level of the Butte & Boston, Republic, shows $17.60 gold and $6.12 silver per ton, or a total of $23.72 per ton. ——H. L. Neville is pushing work on the Chespa–Blue Jay; the old shaft is down 85 feet; a new shaft is being sunk.——Near Keller, drifting from the 50-foot shaft on the Umatilla is in progress.——Development on the Manila shows a continuation of the high-grade ore body recently opened up.

OKANOGAN COUNTY.

The Success G. M. & M. Co., H. M. Curry manager, will push work on its property on Æneas mountain, near Loomis, during the winter.——A strike of ore assaying $73.22 per ton ($69 being copper) is reported made at a depth of 120 feet in the Methow, on Methow river, 6 miles from Winthrop.

WYOMING.

FREMONT COUNTY.

Manager B. N. Tibbals will sink on the Carissa, at South Pass.——J. Boyland has men working on the Burr at Lewiston.——The Home Development Co. is organized at South Pass to work the Independence group, near there.

FOREIGN.

AFRICA.

A company will be formed to work the new gold fields recently found in South Kordofan, in the Soudan.

BRITISH COLUMBIA.

A new seven-drill compressor and extra machine drill will go in on the Snowshoe, near Phœnix.——At Deadwood, a new forty-drill compressor is in place on the Mother Lode; high-grade ore is reported opened up on the 300-foot level.——The British Columbia, in Summit camp, is shipping 250 tons ore per day.——On the Giant, Rossland, stoping is in progress. ——At the New St. Elmo, the north drift is in 60 feet, south 325 feet; two shifts are working; cost of drifting per foot, including air superintendence, etc., is $14.——Progress is reported on the new Le Roi mill.——The War Eagle shaft, now down 1195 feet, will be sunk an additional 55 feet. ——The winze on the Evening Star is down 296 feet; crosscutting is in progress. ——A pump station is being cut in the Josie claim of the Le Roi No. 2.——The shaft on the Rossland Great Western is down 645 feet.——A diamond drill will be used on the Big Four.——On the Northern Bell the crosscut tunnel is in 270 feet.——The Iron Mask is shipping ore.

It is reported Guggenheim & Sons, of Antofagasta, Chili, have contracted to buy $1,000,000 worth of reduced silver-lead ore from the St. Eugene Con. M. Co., of Moyie.

The Tamarac, at Ymir, is shipping forty tons of ore daily.——The North American M. Co. will resume work on its properties near Ymir.

The British Columbia C. Co. will put in a new three-drill compressor on the No. 7, near Greenwood.——The British Columbia (Rossland) & Slocan syndicate is putting in a seven-drill 16x24 compressor, and three 3½ hand drills on the Snowshoe.

During November the mines of Kootenay and Yale produced 57,500 tons of ore.

The Metropolitan group, comprising the San Francisco, Chicago, Boston, New York, Montreal and Fairview claims, in the Lardeau, 9 miles from Ferguson, is reported sold to C. W. McCrossan, of Duluth, Minn.——The winze on the Evening Star is down 304 feet.

Twenty-three tons of ore from the I. X. L., Rossland, recently shipped to the Northport, Wash., smelter, returned $7840.

The O. K., Rossland, is bonded to J. S. Baker, managing director of the I. X. L., adjoining. Work will be pushed on both properties.——During the week ending Dec. 15 the following shipments of ore from mines at Rossland were made:

	Tons.
Le Roi	4173
Center Star	2112
Le Roi No. 2	31
Iron Mask	135
Giant	22
Spitzee	22
Total	6495

The Minnesota Silver Co. is running its mill at New Denver; it will turn out a car of high-grade concentrates daily.——Work on the Two Friends is being pushed; ten men are employed.——One hundred men will be employed at the Ivanhoe, Slocan.

A new 20-drill, duplex, Canadian Rand drill air compressor will go in on the Snowshoe, at Phœnix. A temporary 8-drill, straight line compressor will be used until the new plant is in.

The smelter at Nelson is running steadily.——Ore is opened up in the Queen Bess, at Slocan.——Work is being pushed on the Roylston, near Nelson.

The Rossland Bonanza M. Co. is pushing work on the Bonanza, on St. Thomas mountain, 18 miles north of Rossland. An adit is being run on the vein. Ore from the latter assays $34.20 per ton.

MEXICO.

A. B. Adams of Copalquin, Mexico, and W. F. Maginnis of Minnesota will put in a mill on the Palmarito (silver), Sinaloa.

NICARAGUA.

C. J. Corey, writing from Cape Gracias, reports considerable activity in mining on the Waunks and Pis Pis rivers; on the Bonanza, near Great Falls, on the Pis Pis river, over 200 miles from Cape Gracias, a mill is going in; two arrastras are running on the Constancia; it is said that this mine has produced $150,000 in the last four years; gold from these mines brings from $15 to $16 per ounce in New Orleans; an export duty of 10% is charged; a mining claim is 450x600 feet.

ONTARIO.

It is reported that a $300,000 iron smelter will be built in Kingston next year.

Personal.

W. Babcock of Utah is in New York.

H. Simons of Iowa Hill, Cal., is in San Francisco.

F. Wilson of the Inyo G. & C. M. Co. is in Inyo, Cal.

M. Johnson, Pres. Mazeppa G. M. Co., is in Stent, Cal.

J. Edwards, of Salt Lake, Utah, goes to Phœnix, Ariz.

T. F. Cole has resigned as manager of the Mass Con. M. Co.

Walter Bunce is now Supt. Bachelor mine, near Ouray, Colo.

G. Lavagnino has returned to Salt Lake, Utah, from Europe.

Herbert Lang has returned from El Paso, Texas, to Oakland, Cal.

J. A. Eades, of Soldier Summit, Utah, has returned there from Colorado.

Thos. Brown has been elected Supt. Columbus mine, Mariposa Co., Cal.

P. F. Whirlow, of San Francisco, takes charge of the Angels, Cal., mine.

G. E. Morse, Pres. Swayne M. Co., Jacksonville, Or., is in Cleveland, Ohio.

O. A. Cecil, assayer Jumper, Stent, Cal., has returned there from Nebraska.

T. L. Huddleson has returned from South America to Salt Lake City, Utah.

Manager Waterhouse of the Golden Trout M. Co., Oroville, Cal., is in Boston, Mass.

W. H. Hill, general manager Last Chance M. Co., Trinity, Cal., is in the East.

W. Maitland, Supt. Nash Deep Gravel mine, Weaverville, Cal., is in San Francisco.

J. Morris is appointed Supt. Mountain Lily, Columbia, Cal., vice M. Page, resigned.

C. Brockington, Supt. Orleans, Grass Valley, Cal., has returned there from San Francisco.

D. McVichie, Supt. Bingham C. & G. M. Co., Bingham, Utah, has gone to Bland, New Mexico.

R. Truman, general manager Ray Mines, Ltd., has returned to Florence, Ariz., from New York.

C. L. Buckingham, a millwright of Denver, Colo., is on a business trip through Arizona and California.

G. K. Fischer, Supt. Construction of the Highland Boy smelter, Bingham, Utah, is in New Mexico.

E. L. Redding is appointed assistant general manager of the Occidental Development Co. of Colorado.

W. W. Thurston, Supt. Lone Jack and Homeward Bound mines, Grass Valley, Cal., leaves for Pennsylvania.

Manager Stalmann of the Glasgow & Western M. Co., Golconda, Nev., has returned there from New York.

A. P. Lewis, Pres. Imperial C. M. Co. and Royal C. M. Co., Frisco, Utah, has returned there from Chicago, Ill.

F. R. Brown, the former foreman, succeeds T. C. Mayon in the superintendency of the Apollo mine, Unga, Alaska.

A. Buckbee is appointed manager Cumberland, at Silver City, Idaho, owned by the Virtue Con. M. Co., of Montreal, Canada.

L. D. Godshall is resident manager Kurtz–Chatterton C. M. Co., and Supt. construction Boston–Wyoming Smelter, Encampment, Wyo.

Bela Kadish, of Baker City, Or., has been offered the superintendency of the smelter at Northport, Wash. The position carries with it a salary of $10,000 a year.

F. T. Freeland of Aspen, Colo., has been appointed general manager Frisco Con. M. Co., Ltd., Gem, Idaho. He has selected G. Ehrenberg assistant manager and A. D. Marshall mine foreman.

W. A. Dennis, for many years Supt. Mountaineer M. & M. Co.'s property, Nevada City, Cal., who, on account of ill health, was compelled to resign one year ago, has again regained his health. On Oct. 1st Mr. Dennis again took charge of the property.

J. H. Hammond says he will sink the main shaft of the Independence mine, Cripple Creek, Colo., to 1400 feet. The deepest shaft in Teller Co., Colo., is now about 1200 feet. The Independence dividends will be cut down 75%, making them $488,000 for the year.

Commercial Paragraphs.

The Vulcan Iron Works Co. of Seattle, Wash., have moved out of their old location to new enlarged quarters.

The Hooper Pneumatic Milling Co. has removed its offices from Baltimore, Md., to 519 W. 30th St., New York City.

McFarlane & Co., Denver, Colo., have made some special types of crushers, rolls, filter presses and other equipment for the Geijsbeek Pottery Co., whose plant for the manufacture of pottery and porcelain ware will soon be completed at Golden, Colo.

The Mine & Smelter Supply Co., Denver, Colo., have made satisfactory tests of the efficiency of the Durkee lightning drill, which is electrically operated, and have decided to manufacture and sell same, having recently sent out a number of that type to mines in Colorado and Arizona.

During the past ten days the Robert Aitchison Perforated Metal Co. of 303 Dearborn street, Chicago, have closed a contract with one of the large thresher manufacturers of the northwest for their season's supply of perforated metals; they have also closed a contract for over sixty thousand square feet of perforated steel for malt machinery. They write: "Business is very good and the outlook promising for its continuing in this way."

Recently Declared Mining Dividends.

	Payable.
Acacia M. Co., Colo., $15,000	Dec. 15
South Godiva M. Co., Utah, $2 per 1,000 shares, $480	Dec. 15
Silver King M. Co., Utah, regular 50 cents per share, $75,000; extra 66⅔ per share, $100,000. Total, $175,000	Dec. 24
Isabella G. M. Co., Colorado, 1 cent per share, $22,500	Dec. 22
Modoc G. M. Co., Colorado, 1 cent per share, $5000	Dec. 15
Nugget G. M. Co., Colorado, $9910	Jan. 15
Zoe G. M. Co., Colorado, $7500	Dec. 25
Homestake M. Co., South Dakota; regular 25 cents per share, extra 25 cents per share; $105,000	Dec. 26
Rocco-Homestake Co., Nevada; 1½ cents per share, $4500	Jan. 10
Gwin Mine Development Co., Cal., 25 cents, $25,000	Dec. 18

Catalogues Received.

In the usual superb style of the Westinghouse Co.'s trade treatises comes a monograph on motor-driven duplex air compressors as built by the Westinghouse Air Brake Co., Pittsburg.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING DEC. 11, 1900.

663,597.—Brake—H. C. Behr, S. F.
663,558.—Eyelet Setter—S. W. Burtchaell, S. F.
663,733.—Milk Bottle—C. E. Crane, Seattle, Wash.
663,603.—Reversing Gear—J. E. Doak, S. F.
663,567.—Pipe Wrench—P. Frichette, Sheridan, Cal.
663,544.—Pipe Cutter—J. S. Hill, Los Angeles, Cal.
663,574.—Face Steamer—W. C. Keithly, S. F.
663,551.—Street Sweeper—J. C. McCollum, Los Angeles, Cal.
663,586.—Burglar Alarm—Jennie Simoni, S. F.
663,792.—Cherry Pitter—E. H. Skinner, Springbrook, Or.
663,837.—Gas Purifier—A. C. Swain, S. F.
653,646.—Filter—A. J. Tait, Oakland, Cal.
33,712.—Design—W. F. Clark, S. F.
33,691.—Design—J. Ewing, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Revolving Cylinder Engines.—No. 663,087. Dec. 4, 1900. James D. McFarland, Jr., San Francisco, Cal., one-half assigned to John Bruckman, same place. This invention relates to an engine in which cylinders are mounted radially with relation to an axis about which they are revoluble, and the piston rods on said cylinders are connected with a second shaft which is eccentrically placed with relation to the first named shaft, whereby a reciprocation of the pistons in the cylinders is produced by their revolution around the two centers. It consists of a series of radially disposed cylinders having closed ends, a wheel, a central shaft with relation to which it is turnable, and with the rim of which wheel the cylinders are connected. A second shaft is eccentrically located with relation to the first shaft and has inlet and outlet passages for the propelling medium. Hollow piston rods extend through stuffing-boxes in the inner heads of the cylinders and have independent passage therethrough communicating respectively with the cylinder chambers upon opposite sides of the piston. Rings inclose the supply shaft and with these rings the hollow piston rods connect. A sleeve is interposed between the rings and the shaft and has slots which coincide periodically with the passages in the shaft and thus lead to the hollow piston rods whereby the propelling medium is alternately admitted and exhausted from opposite sides of the piston.

Bed Bottoms.—No. 663,171. Dec. 4, 1900. John Hoey, San Francisco, Cal. The object of this invention is to overcome the difficulties hitherto experienced in the bed bottoms constructed of an elastic woven netting stretched upon a framework, and this is done by dividing the strain between the end rails and the side rails. This is effected by using a series of cables extending from one side rail to the other and having endwise elasticity, with means by which the tension of these cables can be increased by drawing the central portions of two contiguous cables towards each other transversely of their length. The bed bottom consists of a rigid rectangular frame, a fabric connected with the end bars of the frame, and unconnected with the side bars thereof, means for reducing the strain of the fabric upon the end rails and dividing said strain between the end rails and side rails, consisting of elastic cables extending transversely across from one side rail to the other beneath and in contact with the central portion of the fabric whereby the tension of said cables acts upon the frame at right angles to the tension of the fabric. Means are provided for connecting the transverse cables in pairs so that the cables of each pair may be drawn toward each other and their tension increased, with means for connecting one pair of cables with the other.

Pipe Wrenches.—No. 663,567. Dec. 11, 1900. P. Frichette, Sheridan, Cal. This invention is an improvement in pipe wrenches, and consists of a single integral bar folded about midway upon itself to form converging jaws, and split from a point near the outer end of the folded portion to form two straight and parallel sides separated from each other. These sides are provided with adjusting holes and a lever having a corrugated and beveled end, is fulcrumed in either of the holes so as to compress the pipe between itself and the two separated sides and the folded portion which forms the final point of contact. Thus clamped, a sufficient purchase may be brought upon the lever to easily turn the pipe in either direction.

BURGLAR ALARM DOOR LOCK.—No. 663,586. Dec. 11, 1900. Jennie Simoni, San Francisco, Cal., one-half assigned to W. K. & I. C. Hays of same place. The object of this invention is to provide an independent movable device which can be placed in contact with a closed door within the room and mechanism carried by the device which will be operated by any pressure applied tending to open the door. It consists of a spring-actuated alarm with a locking device, a base plate upon which this is carried with fixed points adapted to rest upon the floor, a slidable rod having a point adapted to rest against the surface of the door and an angular ring having its opposite sides pivoted to the base plate, said ring carrying a detent upon one edge which engages and normally retains the alarm out of action. An incline upon the opposite side is in line with the slidable shank of the movable point, so that any movement of these parts disengages the detent and sounds the alarm.

TRANSMITTING AND REVERSING GEAR.—No. 663,603. Dec. 11, 1900. J. E. Doak, San Francisco, Cal., one-half assigned to Wm. Leviston, same place. The object of this invention is to provide a simple transmitting and reversing gear for engines. It consists of a driving shaft, a driver fixed thereto, a sleeve having its major axis in the direction of the length of the shaft, and loosely mounted thereon, a second driver on the sleeve, a transmitter adapted to occupy the space between the two drivers and mounted in the plane of the axis of one of them; a means for disengaging or engaging the transmitter with the two drivers, a clutch member fixed to the driving shaft, a second clutch member rigid with the opposite end portion of the sleeve and a unitary mechanism whereby the clutch is engaged or disengaged simultaneously with the disengagement or engagement of the transmitter with the drivers.

Latest Market Reports.

◆

SAN FRANCISCO, Dec. 20, 1900.

SILVER—Per oz., Troy: London, 29⅝d (standard ounce, 925 fine); New York, bar silver, 64c (1000 fine); San Francisco, 64c; Mexican dollars, 50¾c.

COPPER.—New York: Lake, 1 to 3 casks, $17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.62½; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.32½; Salt Lake City, $4.00; St. Louis, $4.20; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £16 2s per ton.

SPELTER. — New York, $4.27½; St. Louis, $4.10; San Francisco, ton lots, 5¼c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9¼c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $13.25; gray forge, $13.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $19.75; open hearth billets, $21.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $25.50; San Francisco, ton lots, 29c; 1000 ℔s., 29¼c; 500 ℔s., 29½c; less, 30c; bar tin, ℘ ℔, 35c.

QUICKSILVER. — New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.00 ℘ flask of 76½ ℔s.; Export, $45.

NICKEL.—New York, 50@60c ℘ ℔.

MAGNESIUM.—New York, $3.00 ℘ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¼c; slab, 5¾c; bar, 7c.

BABBITT METAL.— San Francisco, No. 1, 10c.

SOLDER. — Half-and-half, 100-℔. lots, 18½c; San Francisco, Plumbers', 100-℔. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c ℘ ℔, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

BISMUTH.—New York, ℘ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

PHOSPHORUS. — F. o. b. New York 50@60c ℘ ℔.

TUNGSTEN.—New York, ℘ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.—San Francisco, crude, $17 ℘ oz.; New York, $18.20 per Troy oz

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¼c ℘ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c ℘ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ℘ ℔.; soda ash, $1.60 ℘ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ℘ ℔.; blue vitriol, 5½@6c ℘ ℔.; borax, concentrated, 7@8c ℘ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℘ ℔.; caustic soda, in drums, 3@4c ℘ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ℘ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

OILS.—Linseed, pure, boiled, bbl., 86c; cs., 91c; raw, bbl., 84c; cs., 89c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 70c; cs., 75c; No. 1 bbl., 50c; cs., 55c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 65c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

This Paper One Year, 52 Times, $3, POSTPAID TO ANY PART OF NORTH AMERICA.

SITUATIONS WANTED.

Position as superintendent of gold mine wanted by a Mining Engineer who has had 11 years' practical experience in mines, mills and cyanide plants in California and abroad. Has his own assay outfit. Address M. E. M., Mining and Scientific Press.

YOUNG MINING AND MECHANICAL ENGINEER desires position. Technical and practical training. First-class mine and land surveyor. Neat and accurate draughtsman. Six years' experience. Accustomed to handling men. No objection to office work. Excellent references. Address E. N., this office.

Mining engineer with ten years' experience in copper and lead mining, milling and smelting, desires to secure position as superintendent or manager of developing or producing property in this country or abroad. Good assayer, surveyor and bookkeeper. Address "Montana," care of Mining and Scientific Press.

WANTED.—A position as superintendent for a mining company by a man of 16 years' practical mining experience; understands mining and milling (amalgamation, concentration and leaching); good assayer and accountant; would accept a subordinate position if good; references. Address "Advertiser," 1225 Webster St., Oakland, Cal.

A position as Superintendent or Mining Foreman. Have had 25 years of practical mining experience in California and Mexico, and have had the handling of large forces of men. Can go through any kind of ground. Am a first-class all round miner. Best of references. Address D. E. F., care of Mining and Scientific Press.

CHEMIST AND ASSAYER, with experience in draughting, bookkeeping and typewriting, desires position as assayer or assayer and bookkeeper in mine or as secretary to mining engineer or mine official. Has fair literary and scientific education. Experience in the preparation of reports, prospectuses and catalogues. Excellent moral character and good health. For further particulars, address E. R. M., care Mining and Scientific Press,

Engineers, Firemen, Machinists and Electricians: New 40-page pamphlet containing Questions asked by Examining Board of Engineers. Sent free. GEO. A. ZELLER. Publisher. ST. LOUIS. MO.

WANTED.

WANTED. — INFORMATION ABOUT ANY mine or mining camp where there would be an opening for a store.

Address A. H., this paper.

WANTED.—For a large mine in California, a technically educated mining engineer with practical experience in the working of large mines and the handling of men. Must be a man of energy, character and a first class all round miner. Address "AJAX," care Mining and Scientific Press.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of the CONS. ST. GOTHARD GOLD MINING COMPANY will be held at the office of the Company, 113–114 Crocker Building, San Francisco, California, on THURSDAY, the 10th day of January, 1901, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

Transfer Books will close on MONDAY, December 31, 1900, at 3 o'clock P. M.

B. N. SHOECRAFT, Secretary.

Office—113–114 Crocker Building, San Francisco, California.

For the purpose of quickly introducing and demonstrating the superior merits of its courses, the Trustees of THE AMERICAN SCHOOL OF CORRESPONDENCE have voted to award a

FREE SCHOLARSHIP

IN STEAM, ELECTRICAL, MECHANICAL, MARINE OR LOCOMOTIVE

ENGINEERING,

Including a complete course in MECHANICAL DRAWING, to a few well-recommended, ambitious men in each manufacturing plant in the United States.

The holders of these FREE SCHOLARSHIPS will be asked to answer any inquiries as to the benefit and value of the instruction and also recommend the School to their friends, thus establishing an endless chain of enthusiastic students who will advertise the School more thoroughly than tons of printed matter or an army of agents. Application blank on request (mention MINING AND SCIENTIFIC PRESS).

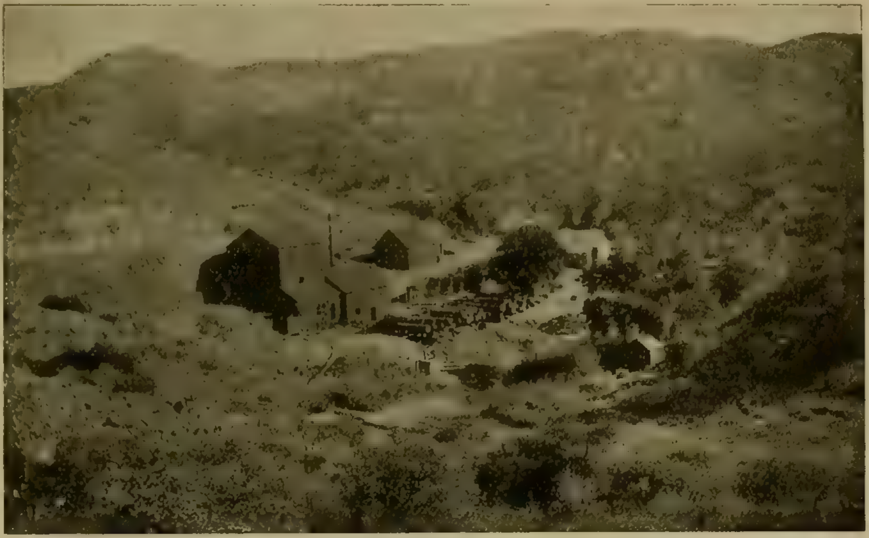
Hand Power Drill.

Herewith are three views of a hand power drill, Fig. 1 the drill in position for vertical boring, Fig. 2 in position for boring at an angle, Fig. 3 as used in exploring a proposed dam site on the Gila river, Arizona. The drill weighs, set up, 200 lbs., size of bit $1\frac{9}{16}$ ins., size of core 1 in., capacity 350 ft. It may be run by hand power or small engine. J. B. Lippincott, U. S. G. S., in a report of the work of one of these drills, as shown in Fig. 3, says that fifty-two holes were sunk, a total of 3254.2 feet, at a cost of $8030, average per foot $2.46. They are made by the American Diamond Rock Drill Co., 120 Liberty street, New York.



Fortuna Mining Co.'s Mill, Agua Dulce, Baja California.

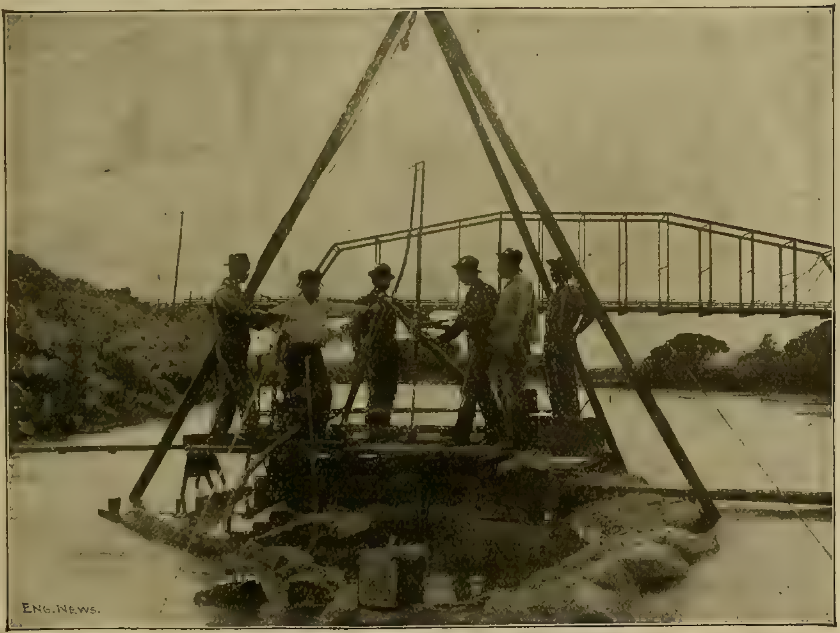


Fig. 3—Exploring a Proposed Dam Site.

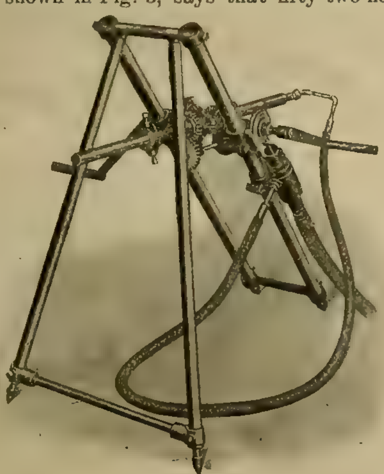

Fig. 2.

Baja California.

Extending through nearly ten degrees north latitude lies the narrow, barren peninsula of Baja or Lower California, which, though discovered nearly 400 years ago, is still largely unexplored. It is fairly rich in mineral wealth, which is being slowly developed. The country offers little inducement to the American miner. The largest mining enterprise in the peninsula, the Compagnie des Boleo, of Santa Rosalia, is a European concern, producing considerable copper, transacting all its business with France. That company has spent several million dollars, employs nearly 3000 men, and in all its appliances is fully abreast of the times in all the requirements of modern mining methods. The Ybarra Co. is a California concern that has invested considerable money and made extensive development. Jacalitos is 50 miles from Ensenada, and 100 miles from San Diego, Cal. The engravings on the extreme right portray the hoist, dump and stamp mill of the Alemana mine, owned and operated by the Trinidad Mining & Milling Co.

Fifty miles east of Ensenada, in the Saragossa district, is the property of the La Fortuna G. M. & M. Co. An engraving of the company's mill appears above.

PROBABLY the most noticeable result of the electrical exhibit at the Paris exhibition will be the standardization of the systems of generating electricity, on the lines suggested editorially in this and other technical journals, and the more universal use of the three-phase alternating current at from 2000 to 6000 volts.

◆

THE building of the Los Angeles & Salt Lake Railroad will be a big factor in the mineral development of the section traversed by the new line. It is a region of great mineral wealth, but its inaccessibility has always worked against its development. Already Los Angeles complains of a scarcity of mining men and prospectors, many of the latter having started to locate claims along the supposed route.

◆

THERE were about thirty great inventions and discoveries during the century now closing that deserve especial mention as being in the front rank of scientific progress: railroads, steamships, the telegraph, the telephone, lucifer matches, gas illumination, electric lighting, photography, anæsthetics, antiseptic surgery, conservation of force, germ theory of disease, organic evolution, the antiquity of man, the glacial epoch, the Roentgen rays, the spectroscope, the Bessemer process, the periodic law in chemistry, cell theory and embryology, the modern printing press, vortex theory of matter, the nebular theory, the uses of dust, the molecular theory of gases, the cyanide process, the cotton gin, the sewing machine, petroleum, electric power, modern mining methods.

◆

DURING the year the U. S. Government has had a new plan in operation for the first time, whereby a saving of about $65,000 was made in the manner of refining at the several U. S. mints. It is necessary to mix a certain percentage of silver with gold in refining it, usually about two parts of silver to one of gold, as with the excess of silver the acid acts freely, dissolving all the silver. From the beginning till 1900, the U. S. mints used their own silver over and over again in this process, gaining nothing either in profit nor in quality of the work. This year the Government mints were authorized by law to do refining for individual customers as well as for its own coinage, provided that the charges do not exceed the actual cost of the work. The Treasury Department lowered the scale of charges for refining silver, for the first time since 1880, so as to attract silver held by private parties, and thus get what it needed for its gold refining with compensation therefor.

The End and Beginning.

This is the last issue of this paper in the nineteenth century. Next Saturday's issue—No. 2111—will be the first one of the twentieth century. The essence and spirit of the century closing has been the rise of science; this great adjustment of industrial conditions will tend to still further widen individual opportunity in the coming century. It is the end and beginning—the end of a century of great progress, the beginning of an era of greater development. The century has been a great one for the United States, expanding from 5,000,000 feeble residents on a strip of Atlantic coast to 77,000,000, dominating a continent, foremost in all victories of peace or war, potent in discovery and master of the world's forces. In the beginning of this century the past seemed narrow, the future grew broader, the horizon widened; now, on the threshold of the twentieth century, the achievements of the past hundred years, great though they have been, seem but the indications of what awaits humanity.

The inventive mind, the scientific research, the enterprise of the daring, the chance for individual advancement, the perfection of modern machinery, the precision and economical result of modern mining methods, are among the forces and attributes that have made this century able to make its successor heir to so rich a legacy of organized industry, advanced knowledge and perfection of method and mechanism.

At the base of all this lies mining and scientific progress; the scientific miner is the man who, beyond all others, has made the nineteenth century the greatest of all those periods of time since time first began to be so measured. In this country, especially, mining—the basic industry of the nation—has created commonwealths, populated vast regions, developed their resources and contributed its quota to making the United States the commanding power of the planet. Upon the basis of scientific mining is reared the nation's industrial and commercial prosperity. Bullion is the blood of business, and the product of the pick and drill circulating in the nation's financial veins has vivified every fiber of material life. The miner is the great creator of eternal wealth. Unlike other forms of evanescent riches, the miner's product takes on the attributes of immortality and lives forever through the centuries, shedding a luster on the passing years and sustaining innumerable succession of enterprises in Time's course. The miner and prospector are the avant couriers and sustainers of civilization; they carry the gospel of development across mountain and desert, and beyond the frozen northern seas they hold aloft, full high advanced, the flag of progress, and with unequaled sublimity of self-reliance they lead wherever hope sweeps on with flashing finger pointing to the golden goal.

Let circumstance oppose them,
  They bend it to their will;
And though the flood o'erflows them,
  They dive and stem it still.
Let lower spirits linger
  For hint or beck or nod,
They only see the finger
  Of an onward urging God.

All hail and honor to the prospector, the miner, the scientific searcher, the metallurgist, the man in any and every capacity who makes and maintains the pre-eminence of the mining and scientific development of the century, and for him may the star of victory ever glitter in the strife!

◆

ABOUT the best advertisement of this paper's merits and value to miners, mill men, metallurgists, mining engineers, electricians and machine workers everywhere is the index on pages 809, 810, 811 and 812 of this issue. Over 1500 references are there made to articles and items of the greatest practical value to any one in any way directly or indirectly connected with the mining industry, which have appeared in the 81st volume of this paper, of which this is the 26th issue. Two such volumes every year furnish about 3000 such references, profusely illustrated, the latest and best in the mining world, sent postpaid to any part of North America every week, as issued, for $3. Gratified subscribers yearly write to the effect that the $3 that brings them 52 issues of such a paper is their best paying investment proportionate to the amount so paid.

Notable Electrical Transmission.

California has several notable electric transmission plants whose magnitude has attracted universal attention. In the State of Washington, in the northwestern corner of the Union, is an electric transmission system deserving of notice. A brief account of the successful transmission of electrical energy thereby, a distance of 153 miles on Nov. 13, 1900, is given in this week's issue. Several previous references have been made to the work as it progressed.

The plant is at Snoqualmie Falls, Wash., where the Snoqualmie river has a vertical drop of 270 feet, giving an available energy of 35,000 H. P. All the electrical machinery, together with the water wheels, is installed in a large chamber directly under the tail race tunnel that extends to the river below the falls. Impulse wheels on horizontal shafts and aluminum wires for transmission are among other notable features, beside a submerged concrete dam built across the river, which raises the low water elevation of the river 6 feet at the intake.

There are four electrical generators, each of 1500 K. W. capacity, each weighing about 100,000 pounds. They are of the revolving armature type, delivering a three-phase current at 1000 volts, 7200 alternations, the normal fuel load current being 1000 amperes per phase. The armatures are 96 inches diameter, speed 300 revolutions per minute, the peripheral velocity being thus almost 1½ miles per minute. Without load the generators require a field current of ninety-five amperes at ninety volts; with full non-inductive load, 100 amperes to maintain the same electro-motive force. It is calculated that in these armatures about 4,500,000 foot-pounds of energy is stored at 300 revolutions per minute, the stored energy in a single revolving armature equaling the electrical output of that armature at full load in four seconds.

In the transformer house at the head of the shaft the current is received at an initial voltage of 1000, and, passing into the step-up transformers, is raised to 30,000, the nominal voltage of transmission. Cables of twisted aluminum wire carry the 1000-volt current from the switchboard to the transformer house; the conductors running first to the step-up transformers, and thence to a second switchboard controlling the transmission lines. A high-tension plug-board in the transformer house permits any desired combination of transformers and circuits. Similar plug-boards are arranged at Renton, Seattle and Tacoma, and it was by the use of those plug-boards that the combination was made last November, as described elsewhere in this week's issue, that made possible the circuit from the power house at the falls to Seattle, back to the falls, thence to Tacoma, and again back to the falls—an entire distance of 153 miles.

The circuits are all of stranded aluminum cables, this being, so far as known, the first instance of the use of this metal in such long-distance transmission, though aluminum cables are in use in two California long-distance electrical transmission systems. The electrical conductivity of aluminum is about 60% that of copper, so that an aluminum cable so employed to have capacity equal to copper needs to have a cross-section 66⅔% greater, though with such increased size the weight is but one-half that of copper. In California some difficulty is found in splicing, and the greater surface exposed to storm entails disadvantages not entirely overcome.

The Snoqualmie Falls Power Co., operating the system here briefly described, has stations at several points on its line and at the termini, and is developing 10,000 H. P., supplying light and power, with ability, if desired, to produce and furnish all requirements in that direction far beyond its present capacity.

◆

A GENERATION AGO deep mining west of the Rocky mountains culminated on the eastern slopes of the Sierras in shafts from 2700 to 3300 feet deep on the Comstock, Nevada. In the Calumet copper mines of Michigan are now the deepest mine shafts, where, within an area of one square mile, the Tamarack M. Co. has three shafts, 4450, 4650 and 4750 feet in depth, respectively, and the Calumet & Hecla one of 4900 feet vertical depth. The former company proposes this year to sink one of its shafts—No. 5—to a depth of one mile from the surface.

Concentrates.

METALLIC GOLD is not soluble in any single known acid.

THE efficiency of man as a human machine is figured to be about 20%.

AUSTRALIA has not yet imposed the proposed 2% export duty on gold.

LEPIDOLITE is found in abundance near Pala, San Diego county, Cal.

PATENTED MINING CLAIMS are taxable, the same as any other real estate.

ALL SOLIDS, and, probably, all liquids, become incandescent at the same temperature.

THE deepest shaft in Colorado is at the Geyser mine, near Silver Cliff, Custer Co., 2640 feet deep.

EXHAUST STEAM should solve the difficulty experienced in the freezing of the cyanide solution.

COPPER can be welded. C. G. Wilborg, Galesburg, Ill., can give full practical account of the work.

THE Colorado School of Mines, at Golden, charges students from other States $100 per year tuition.

A COMPLETE file of this paper from May, 1860, in bound volumes, could be supplied by the business office.

SIXTEEN HORSE POWER should ordinarily suffice for a 10-stamp mill, each 850 pounds, 7 inches lift, 90 drops per minute.

THE locator of a mining claim located since Jan. 1, 1900, has till Dec. 31, 1901, to do the first required $100 of assessment work.

IF, after the treatment with sulphuric acid, the heavy petroleum does not sufficiently refine, try silicate of soda as a neutralizing agent.

ONE pound of anthracite coal will produce about 90 cubic feet of gas, having a calorific value of about 137 B. T. U. per cubic foot.

AFTER a valid location of a mining claim is made, the locator holds it only upon the condition that he works upon and improves the claim.

THERE is a difference between German and American avoirdupois weights. A German pound equals 1.1023 American pounds, avoirdupois.

IN various placer sections iron rails are now used placed lengthwise in the sluices, for riffles, close together, and with uniformly good results.

ORDINARY domestic kerosene of 120° F. flash and 150° F. fire test has a specific gravity of about 0.785, and one gallon will equal 8.33×.785=6.539 pounds.

A READY and simple way of making oxygen is to heat in a close retort a mixture of four parts chlorate of potash and one part black oxide of manganese.

THERE is no "State mining law" concerning mining locations in California at present, the last legislature having repealed the law passed by its predecessor.

PROBABLY the lowest cost production of metallic lead in the United States is in southeast Missouri, where statistics indicate an average cost of 2½ cents per pound.

A RECITAL, in the location notice of a mining claim, that it is the relocation of another mining claim, is an implied admission of the validity of the former location.

IF a patentee finds himself justly entitled upon his invention to more than is secured to him by the patent already granted, the safe and proper remedy is by a reissue.

BORNITE is a copper-iron sulphide of a reddish-yellow color with an iridescent tarnish. It sometimes runs as high as 50% copper and occasionally contains gold and silver.

THE ridiculous statements in sundry dailies regarding the price of molybdenum and the demand therefor are not to be given serious notice, and were not, apparently, intended to be believed.

NO BOILER should be subjected to a test under pressure of steam. When testing a boiler by the cold water method, should a leak or rupture occur, the pressure would at once fall to zero.

SLUICES need rarely exceed 1000 feet in length, though greater lengths are not uncommon. At one time the Spring Valley mine at Cherokee, Cal., used three parallel sluices, each 2½ miles in length.

IT is not necessary in Hawaii or the Philippines to pay any government fee for the registration of U. S. patents. It is merely required that a certified copy of the patent be filed with the Governor-General.

OPAL is a variety of quartz in which the silica appears to have a different molecular arrangement. Its hardness and specific gravity are less than ordinary quartz. It is soluble in a hot alkaline solution.

A VOLUME of 500 cubic feet of free air per minute, at 75 pounds, can be transmitted through 1000 feet of 3-inch pipe with a loss of 41 pounds. If a 5-inch pipe were used the loss would be reduced to 0.24 pounds.

THE horse power of a gasoline engine is found by multiplying the area of the piston in square inches by the mean effective pressure in pounds per square inch, and by the number of explosions per minute. Multiply the quotient thus obtained by one-half the piston speed in feet per minute (if a single-acting engine) and divide by 33,000; the quotient will be the indicated horse power.

THE Federal Courts have decided that, as between the wet process and the fire assay, the latter shall be the official method of determining the amount of dutiable lead in ores imported into the United States.

BY warming the fuel, and with the use of a tank carbureter, it is considered possible to "run an ordinary gas engine with kerosene." Kerosene will ignite from a hot surface at a much lower temperature than gas.

SULPHOCYANATE OF POTASSIUM is a double cyanide of sulphur and potassium, formed by reaction of soluble sulphides on cyanide: these soluble sulphides are formed by the action of cyanide of potassium on some metallic sulphides.

CONCERNING the "Concentrate" in the issue of Dec. 15, 1900, regarding the paper on mica by J. A. Holmes, any requests for copies thereof should be addressed to R. W. Raymond, Sec. A. I. M. E., 99 John St., New York City.

IN a mile of 6-inch pipe, with a velocity of 3 feet per second, the loss of pressure will be 15 pounds per square inch when new, and this will be increased to 31 when the pipe is rusted and covered with incrustations after the lapse of time.

THERE are three places in the United States where the magnetic needle will point directly toward the north —Lansing, Mich., Columbus, Ohio, and Charleston, S. C. At the north pole the magnetic needle would point straight down.

THE statement that East Indian copper coins were shipped to this country as scrap copper was exact. The last shipment was 250 tons to the Oxford Copper Co., New York City, and 5 tons to the New Haven, Conn., Brass Foundry Co.

IN mine surveying the difficulty sometimes found in sighting the fine string hanging from the station roof, carrying a plumb-bob, can be obviated in the case of dim light by having the back-sight man hold a piece of white tracing cloth behind the string.

THE permanganate process of gold recovery has been repeatedly described herein, and while experimental tests have reported satisfactory results, so far as known the process has not in an extended or commercial way yet given evidence of commanding value.

IF an ounce of iron and a ton of iron were dropped from the same vertical height at the same time, the ounce piece would reach the ground first, because of the resistancy of the air. In a vacuum all bodies, regardless of weight, fall with the same velocity through any distance.

THE atmosphere extends at the equator 26,000 miles beyond the earth, and at the poles 17,000 miles. The old estimates of the height of the atmosphere based on decrease of temperature of 1° C. for each 100 meters elevation are abandoned. The actual decrease is 0.6° per 100 meters.

UNDER a contract for milling ores which provides that "said ores, rock and earth shall be worked in the usual and ordinary manner of working like ores, and returns therefrom shall not be less than 70% of the pulp assay," the return is for an average of 70% and not on each ton of ore furnished.

IN the C. Grollet chlorine and bromine process for the extraction of gold, chlorine is introduced at the beginning of the operation and bromine at the end, the operation lasting usually eight to twelve hours. The process is claimed to give satisfactory results at an experimental plant at Harfleur, France.

THE energy transformed by one gallon of liquid air, when evaporated and expanded into 800 gallons of air of ordinary temperature and atmospheric pressure amounts to approximately ¾ H. P. for one hour. A moderate estimate of the cost of liquid air, when produced in quantities, is 20 cents per gallon.

AT sea level, to raise water which flows freely to the suction pipe of a pump to a height of 8 feet requires at least 7 inches of vacuum; this corresponds to an atmospheric pressure of 11.228 pounds; at that pressure water boils at 198° F. The pump would not, probably, lift water at a temperature exceeding 150° F.

A "BEDDED VEIN" is understood to mean an ore body or vein matter lying about as a seam or bed of coal lies between sandstone strata, horizontal or inclined, as are the strata between which it exists. A fissure vein may cut clear across the stratification planes of the rocks; a bedded vein does not, but conforms to their dip or lay.

A $20 GOLD PIECE weighs 516 grains—1.075 ounces. Of this, 90% is pure gold and 10% copper, there being .9675 of an ounce of pure gold and .1075 of an ounce of copper. One ounce of pure gold is worth $20.671834625; the actual amount of pure gold in a $20 gold piece is $19.9981999368, so that if there be no loss by wear or abrasion there is practically $20 worth of pure gold in a $20 gold piece.

THE total exports of sulphur from all Sicily during 1899 amounted to 490,325 tons, of which 134,288 tons came to the United States; the average price was $18.72 per ton, against $18.85 during the year before. As to the quantities exported to the United States during the last seventeen years, the highest figure touched was in 1891, when it reached $21.95 per ton; the lowest, in 1895, averaged $10.86 per ton. The largest quantity shipped during any one year was in 1898—142,553 tons; smallest quantity, 1887, 68,347 tons.

WITH a triplex pump forcing water to the surface, the delivery pipe discharging at an elevation of 300 feet above the pump, the pressure gauge connected with the bottom end of the delivery pipe indicating a pressure of 144 pounds per square inch, the velocity of the flow through the 6-inch delivery pipe is 688½ feet per minute, and the quantity pumped per minute is 135.2 cubic feet.

MINERAL LODES are ordinarily more recent than the rocks they traverse, and older than the rocks or lodes by which they are intersected. Nor are mineral veins all of the same age; they are of different ages and different places, the same as the mountain ranges and the dykes of igneous rocks are of different ages. Each vein system owes its existence to local events and conditions, both at the surface and at depth.

MUCH of the most desirable and valuable matter published herein each week is furnished by the readers of this paper, referring to work that they are doing or in which they are interested. Probably no other journal published contains so much original material from the men who do what they write about. Such matter is always gladly received, and any expense attached to securing available material will be cheerfully audited.

THE tractive power of a mine locomotive is found as follows: The diameter of the cylinder squared, multiplied by the length of stroke in inches, multiplied by the mean effective pressure in pounds, divided by the diameter of the driving wheel in inches, equals the total tractive power. The mean effective pressure in the cylinder is assumed at 85% of the boiler pressure. The tractive power of a locomotive multiplied by the speed in miles per hour, divided by 375, gives the horse power developed.

IF charges of gas pass through the engine unignited when the engine is working under a fair load it is ordinarily an indication of need of repair of the igniter. With an electric igniter employing a battery as a source of current, it is frequently the battery that is at fault. Open circuit batteries when nearly exhausted regain some strength when rested over night, and will furnish ample current for a short time, but rapidly weaken in use. If the battery has run for some time it should be renewed, and the effect upon the ignition noted.

AT Anaconda, Montana, the slimes average 50% silver, 0.5% gold, 15% copper, and 34.5% valueless impurities. They are washed and put into a lead-lined tank, with three parts 66° sulphuric acid and one part water. Steam and air are introduced through a perforated lead pipe by means of an injector. This treatment oxidizes and dissolves the copper, together with some of the impurities. The slimes are then washed on a filter, dried, mixed with one-fifth their weight of soda ash, and melted in a small reverberatory furnace, finally being cast into bars of bullion 980 fine. This bullion is shipped to the parting works for separation of the gold and silver.

A, HAVING located a tunnel site, subsequent mining locations on the line thereof are prohibited so long as work is being prosecuted with reasonable diligence in the tunnel; if B locates a mining claim subsequent to A's tunnel location, the latter is senior in point of time, and A may drive his tunnel through B's claim without his consent. If, however, A and B are simply locators of mining claims which may be near or join each other, A has no right to pass through B's claim, although B may be junior in point of time to A. The location of a mining claim does not carry with it the right to pass through other claims subsequently located. The consent of the junior locator is essential.

THE style spoken of is the hydraulic chief knuckle joint and nozzle with two elbows placed in reverse position, when in right line, connected by a ring in which are anti-friction rollers. The ring is bolted to the flange on the elbow, but gives the upper elbow free horizontal movement, while vertical movement is obtained through a knuckle joint placed in outlet on the top elbow. This joint is a concave surface fitted to a convex one, the former having an opening for the pipe to pass through. The interior is unobstructed by bolts or fastenings, and the man at the pipe operates it by a lever. Vanes or riffles are inserted in the discharge pipe, to prevent a rotary movement of water caused by the elbows, and to force it to issue in a straight, concentrated and solid form.

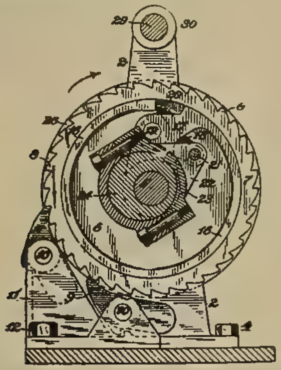
IF the co-owner or owners in a mining claim neglect or refuse to put up or do their share of the annual work necessary to hold the claim, he or they interested who want to hold it should first do the required assessment work, then give the delinquent legal notice by personal notice in writing or by publication. If in the former way after ninety days the delinquent fails to pay his share his interest becomes the property of him or them who have done the required work; if by the latter way, the delinquent has ninety days after the last date of publication. "Advertising out" a delinquent co-owner is never a pleasant job, and everything done should be in strict accord with all legal requirements, including filing of certificate of annual expenditure with the county recorder. In case of subsequent demonstration of value there is often likelihood of contested title, and in such case the holder of the claim should be fortified by legal proof of his rights.

Mining and Metallurgical Patents.

Patents Issued December 18, 1900.

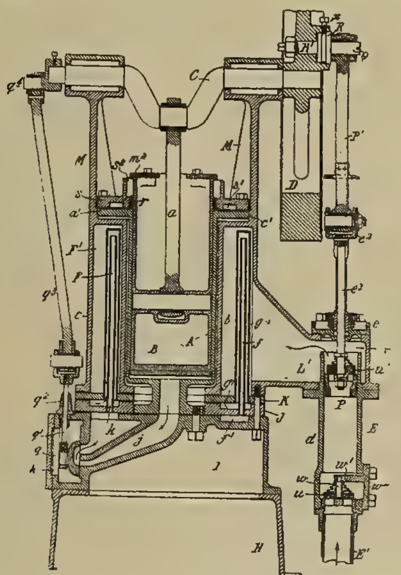
Specially Reported for the MINING AND SCIENTIFIC PRESS.

LOWERING BRAKE FOR HOIST.—No. 663,886; W. S. Halsey, Pittsburg, Pa.



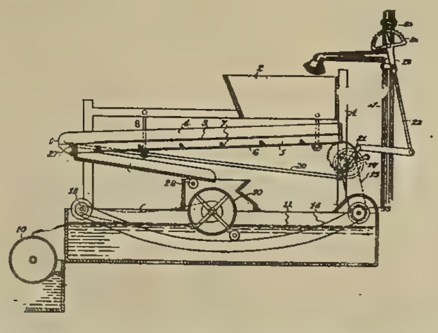
Combination of shaft, hoisting drum fixed thereto, friction wheel fitted to turn freely on shaft, means for preventing rotation of friction wheel in one direction upon shaft, permitting its rotation thereon in opposite direction, internally bored circumferential flange forming frictional bearing surface, on friction wheel, transversely divided expansible friction-ring fitting bearing surface, connecting arm fixed to end of friction ring and to shaft, double-armed expanding lever fulcrumed in connecting arm having its outer arm adapted to abut against end of friction ring opposite that to which connecting arm is fixed, eccentric fixed to operating wheel, and strap encircling eccentric and coupled to inner arm of expanding lever.

STEAM PUMPING ENGINE.—No. 663,909; F. M. Leavitt, New York, N. Y.



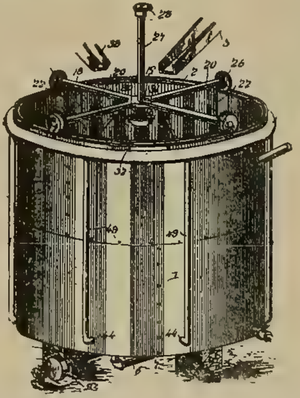
Combination of shell L having outer and inner walls c b, forming between them condenser chamber F′ closed at top, base shell I beneath, condenser tube plates J and K clamped between shells, inner and outer condenser tubes f and g projecting upward from respective plates into chamber F′, parts formed with annular passage f′ communicating with lower ends of tubes f, and with annular passage g′ communicating with lower ends of tubes g, vacuum pump, base shell I formed with exhaust passage k leading to passage f′; passage l leading from passage g′ to pump.

GOLD SEPARATOR.—No. 663,993; W. W. M. Hickey, San Francisco, Cal.



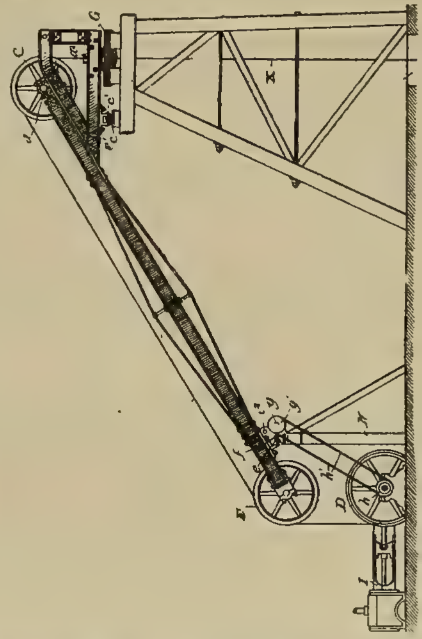
Gold separator, including inclined screen, amalgamated plate below screen having riffles, water tank, chute connected with amalgamated plate inclined reversely thereto, amalgamated drum cylinder below discharge end of chute receiving material therefrom, belt submerged within tank, receiving and conveying away material discharged from cylinder, drums at opposite portions of tank around which belt passes, connections between drum and amalgamated drum for rotating latter in unison with movements of belt.

ORE MIXING MACHINE.—No. 664,059; J. P. Schuch, Jr., Cripple Creek, Colo.



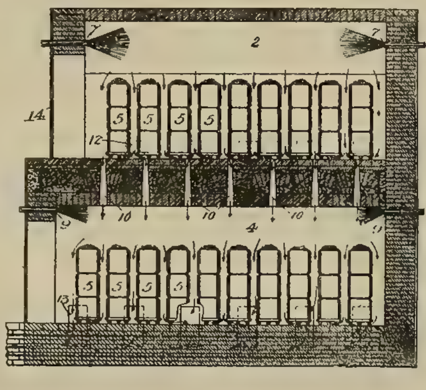
An open tank provided at bottom with solution drain, perforated false bottom arranged within tank above main bottom and supporting filtering material, ore discharge pipe communicating with interior of tank immediately above plane of false bottom, revoluble agitator depending within tank in proximity with reference to false bottom, plurality of air jets arranged to communicate with tank in plane intermediate false bottom and lower end of agitator there above.

HOISTING MACHINERY.—No. 664,073; H. C. Behr, San Francisco, Cal., assignor to Fraser & Chalmers, Chicago, Ill.



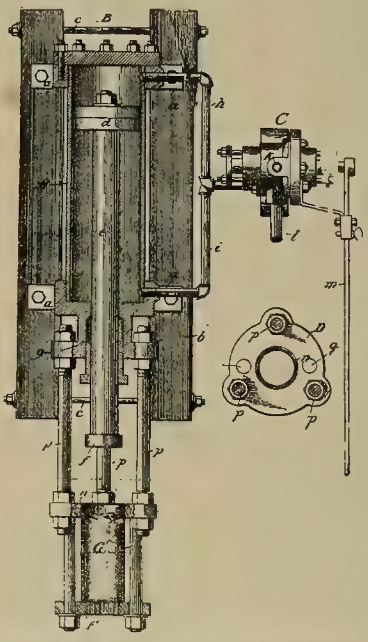
Combination with mine shaft, gallows frame above shaft and winding drum at one side of and extending at angle to shaft, of swinging frame pivoted at one end portion upon gallows-frame extending in downward inclined direction, free end adjacent to drum, swinging at its free end in arc center, approximately in line with rope depending into shaft, pit-head sheave journaled on swinging frame, with rope-leading face on axis of swinging frame, rope-guide sheave on free end portion of swinging frame approximately in line with pit-head sheave.

ANNEALING FURNACE.—No. 664,173; G. W. Packer, Chicago, Ill.



Annealing furnace, upper heating chamber consisting of series of ovens or chambers, passages between adjacent ovens of series, lower heating chamber consisting of series of ovens or chambers provided with passages between adjacent ovens, independent means for supplying fuel and air to each oven, flues leading from each chamber of upper series to one chamber of lower series, escape flues in each lower oven.

AMALGAM PRESS.—No. 664,330; A. Mackay, Douglas Island, Alaska.



Appliance for expressing surplus quicksilver from amalgam, comprising, in combination, frame, threaded apertured plate, rods fixedly connecting plate to frame, foraminous cylindrical receptacle having open ends screwed at top in aperture of plate, rods depending from plate having nuts at lower ends, laterally swinging perforated base plate normally closing lower end of cylinder pivoted to one of depending rods, provided with a recess to engage other depending rod, nuts forming supports for base plate, ram movable in receptacle, means for actuating ram to express quicksilver from amalgam, and to expel latter through open lower end of receptacle when base plate is swung to opening position.

PROCESS OF RECOVERING ZINC.—No. 664,269; C. Hoepfner, Frankfort-on-the-Main, Germany.

Reacting upon zinc oxide or material containing it, with carbonic acid and solution of calcium chloride at temperature above normal and pressure above atmospheric, precipitating portion of zinc as hydroxide with suitable precipitant, as lime, removing precipitated zinc hydroxide, and using regenerated calcium chloride solution in treatment of more raw material.

DIRECTOR ROBERTS, of the United States mint, says that 1901 will show the greatest gold production the world has ever known. "We estimate from data in our possession," he says, "that the world's production next year will reach a total of $365,000,000. The year 1901 will show that the United States is again at the head of all countries as a producer of gold. Our total next year will probably rise to $94,000,000, eclipsing Australia and South Africa for the first time in several years."

THE close of the century has about perfected the steam engine, which is still the great motor; it has bought the gas engine, the air compressor, the electric motor and the water wheel to a degree of perfection that seems to make difficult further progress in efficiency. All these are of foremost use in mining and metallurgy. The close of the century has developed steel production and the smelting of ore from carefully guarded and costly secret processes to a cheap simplicity that makes practical their universal use.

THE California State Mining Bureau has issued Bulletin No. 18, "The Mother Lode Region of California," by W. H. Storms, 154 pages replete with up-to-date information thereon. This appears almost simultaneously with Folio 63, issued by the U. S. Geologic Survey on the same region. Any one possessing the two has about as good an idea of the "mother lode" of California as it is possible to impart by means of illustrated description.

IN this issue of this journal there are 76,176,000 square inches of paper surface.

ARIZONA and New Mexico are twinkling stars on the horizon of statehood.

New Methods for the Extraction of Copper and Zinc.

Written for the MINING AND SCIENTIFIC PRESS by DR. J. OHLY.

The month of October of the present year has been remarkable on account of the discovery of new and advantageous processes employed for the purpose of extracting copper and zinc from their respective ores. These processes have been covered by patents, granted by the United States Government, and are worthy of intimate study, since they disclose a new principle of chemical nature, which was not known unto the present. The first of these patents comprises the employment of "nitre cake," a material resulting in the manufacture of nitric acid from sodium nitrate (Chile saltpetre) and sulphuric acid. The main point of this manufacture consists in the expulsion of all the nitric acid contained in the saltpetre at a low temperature, so as to prevent any loss occasioned by the decomposition of the acid fumes produced. When this point has been reached, the remaining product, known as nitre cake, consists on the average of 75.8% of sodium sulphate, 16.68% of sulphuric acid, 6% water, and 1.52% of insoluble residue. An aqueous solution of this nitre cake has the capacity of dissolving copper and zinc from the respective ores, with the proviso, however, that the latter, if consisting of sulphides, must be subjected to roasting beforehand, while oxides and carbonates can be leached successfully according to this process without resorting to any other preliminary preparation of the ore than crushing and grinding. It has been found also that a 5% Baume solution answers best for the extraction of the ore, since the solvent shows under these conditions a selective propensity for the copper and zinc present, and touches but to a limited extent the iron or aluminum compounds eventually contained in the material to be treated. The solutions resulting in this manner are freed of their metallic contents either by the electrolytic or chemical method, when, in both cases, the copper is precipitated first in the metallic state, and the zinc remains in solution to be recovered afterwards.

The chemical reaction underlying this process consists evidently in the formation of a readily soluble double salt of copper, zinc and sodium sulphates, and is induced by the presence of free sulphuric acid. As the solving action of sodium sulphate, in the form of nitre cake when in aqueous solution, was not known unto the present, this point constitutes the intrinsic value of the patent.

The inventor of the process, C. G. Collins of New York, added, however, two further modifications to the original method, and for each of the three, the United States Government has granted separate patent rights on October 9 of the present year. In the second process, No. 659,339, salt cake is employed instead of nitre cake—the former a product resulting during the first step of soda manufacture from salt and sulphuric acid according to the process of Leblanc. The by-products in the latter consist of hydrochloric acid — besides others not considered here—which serves, when added to black oxide of manganese, for the production of chlorine, by means of which bleaching powder or chloride of lime is manufactured subsequently. These two by-products —hydrochloric acid and bleaching lime—have contributed greatly to keep alive the old Leblanc process, whose invention dates back into the turbulent times of the French revolution, and represents one of the saddest incidents connected with the creation of an ingenious and inventive mind.

In 1775 the French Academy of Sciences offered a high price for the discovery of a process answering the artificial preparation of soda. Nicolas Leblanc was the man to accomplish the project, and, having submitted his process to the Duke of Orleans, he succeeded in obtaining the necessary capital from that personage in order to carry out his proposition on a commercial scale. The merits of his invention having been acknowledged, a patent was granted to him by the French Government, which comprised practically all the steps of the process as it is applied at the present day. Soon after other manufacturing operations of this character were commenced, and the brightest prospects opened for the inventor and his associates, when the duke was thrown into prison by the revolutionists under the accusation of assisting in the manufacture of a product "hurtful to the public health," found guilty forthwith and beheaded in the year 1793. This ruthless procedure of the "Committee of Public Welfare" was followed by another harsh and malicious step, compelling Leblanc to renounce the stipulations of his patent "for the benefit of the country." In spite of his protestations only the paltry sum of 600 francs was awarded to him as indemnification of his losses, and he was left to console himself as best he could for the following years, when in 1801 the soda works were returned to him by decree of Government. But, being without capital at this period, he found it impossible to start the works or even to compete with others, which had had been established in the meantime and were profiting by his invention. Ultimately a committee appointed to investigate his claims awarded him a small remuneration, the insignificance of which drove the inventor to despair, so that he, crushed by the ingratitude of his countrymen, made an attempt on his life, and died a miserable death. Though he left his family in the most destitute circumstances, the small sum granted by the committee was never paid to his wife or children surviving him.

This dreadful experience of the inventor of a process that has brought untold millions into the coffers of the soda manufacturers of the civilized world is proof for the saying that "the way of the inventor is hard," or for the more vulgar variation, "the inventor don't get anything," reminding one of the sad lines of Robert Burns in "Despondency," which read:

> O life! thou art a galling load,
> Along a rough, a weary road,
> For wretches such as I—

In the course of years quite a number of processes aiming at the manufacture of soda, among them the cryolite, ammonia, and several electrolytic methods, have entered into competition with the old invention, so that it has been limited in cases to the manufacture of salt cake, bleach, and hydrochloric acid exclusively. The compound resulting on roasting common salt or sodium chloride with sulphuric acid is naturally an inexpensive product, which can be manufactured or bought in quantities to suit, and consists approximately of 95% sodium sulphate, 2% sodium chloride, 2% of sulphuric acid, and 1% magnesium sulphate, the latter being a usual admixture, in the form of chloride, to common salt, and imparting to it hygroscopic properties.

It will be readily seen, that the roasting of salt with sulphuric acid for the production of salt cake may be carried on to advantage in localities where the two ingredients required can be bought at the lowest figures. Conditions in this respect are undoubtedly favorable in any of the Western States, and it seems, therefore, that this manufacture might be profitably employed in combination with the leaching of copper-zinc ores and the subsequent production of the two metals. Since the price of copper has been in the ascendancy for the past six months, and has reached the respectable figure of 17 cents per pound at present, while that of zinc may be put down as 5 cents for the same amount, there is every reason extant to declare the erection of such works a very lucrative undertaking. This favorable condition is even maintained at present for copper alone, when the recovery of this metal from low-grade ores is carried on by means of sulphuric acid, which must be considered as an expensive article in comparison to the extremely low-priced solvent resulting in the manufacture of salt cake and the by-products consisting of hydrochloric acid and bleaching powder. As these articles bring good figures in the market, it would seem that the point under consideration represents an inducement of extraordinary merits.

There remains, however, one phase in the manufacture of salt cake, which deserves special consideration, and that is the utilization of the hydrochloric acid, resulting as one of the by-products. It might, of course, be conducted into water, which absorbs the acid fumes with avidity, and thus form the commercial article, known as muriatic or hydrochloric acid. The latter may serve subsequently for the manufacture of bleaching powder, but a more profitable and direct utilization of the same would consist in employing it also for the extraction of copper and zinc from the ores by introducing the gas into the water of the tanks containing the crushed material, when it will gradually dissolve in the former and attack the copper and zinc present so as to form a solution of the two chlorides of these metals. The final result would, therefore, differ from that accomplished on applying salt or nitre cake merely by the nature of the copper and zinc salts produced, which would be chlorides when using hydrochloric acid, and sulphates in the other case. The subsequent separation of copper and zinc from these solutions would offer no special difficulties.

Experiments made in this regard by the author show clearly, that the point taken is a correct one, and that the extraction of copper-zinc ores, effected by the simultaneous employment of salt cake and hydrochloric acid gives very encouraging returns. Ores of the character desired not being readily obtainable, equal weights of wasted chalcopyrite, copper glance and unroasted copper carbonate were mixed with the same amounts of roasted zincblende, and the resulting mixture ground to pass through a fifty mesh sieve. One gramme of each sample, thus obtained, was then brought in solution, and the copper and zinc contents determined by the usual titration processes. After that, ten grammes each of the three mixtures were covered with a measured amount of water, when the fumes of hydrochloric acid, produced by heating a weighed amount of salt and sulphuric acid in a glass retort, were conducted into the water to saturation, and left in contact with the ore for twenty-four hours. Three other samples of the same weight and kind were then covered with a 5% Baume solution of the salt cake produced, and the mixture allowed to stand for the same amount of time. The six solutions thus obtained were then drawn off, and their relative copper and zinc percentage determined as before, when the analytical results showed that the extraction percentages for the mixture of unroasted carbonate and roasted zincblende, when treated with salt cake solution amounted to 97.8 in copper and 88.9 in zinc, for the mixture of roasted copper glance and blende to 99.4 and 87.6 respectively, and for that of roasted chalcopyrite and zincblende to 92.4 and 85.5. The extraction of copper, effected by hydrochloric acid, on the other hand, approached closely the figures obtained by the treatment with salt cake solution. while the percentages of zinc were considerably lowered, and amounted to 87.3 in the first case, 75.5 in the second, and 72.4 in the third case.

The separation of the metallic copper and zinc from equal volumes of the six solutions, prepared and tested in the same manner as before, was accomplished by the electrolytical method only, and the results obtained were compared with those resulting through analysis. They were found to approach these figures closely.

The third patent, granted to Mr. Collins under the same date, and numbered 659,340, comprises the employment of both salt cake and niter cake, presumably in equal parts by weight, for the preparation of the solvent. In this case, as in the others, the observations made as to the strength of the solution for the first and second patents hold good, and it is advised to use a strength of 5% Baume in case the ore carries large quantities of iron, aluminum or other soluble substances.

On closer observation of these patents the thought might occur to the reader that they can be readily circumvented by using sodium sulphate or glauber salt, sulphuric acid, and water, in the proportions of 75.8, 16.68 and 6, respectively, in the first case, and sodium sulphate, salt, sulphuric acid, and magnesium sulphate in the relative proportions of 95, 2, 2, and 1 in the second case, though the price of the solvent obtained in this manner would be raised thereby to some extent. By mixing these ingredients in the proportions of 85.5 for glauber salt, 9.34 for sulphuric acid, 1 for salt, 0.5 for magnesium sulphate, and 3 for water, the third solvent would result, and the owner of the patents would not have the right to interfere with the application of these three solvents, prepared in the manner indicated. Though it would be unjust to encourage or induce such practices, the writer cannot refrain from pointing out the risk incurred by inventors through the obligation, imposed upon them by the Government, to explain every detail of their processes in the patent applications, after which the information given is usually spread broadcast by journals and daily papers of the country.

A lixiviating works for the extraction of copper ores, erected on the principles explained above, would preferably be located on a hillside of gentle declivity, the upper terrace being of sufficient size to allow of the erection of a furnace for the manufacture of salt cake, and, in immediate proximity to it, of the placing of two tanks, employed for the alternate dissolving of the copper and zinc from the ore by means of salt cake solution and hydrochloric acid. This furnace should be constructed preferably on the English or Tyneside pattern, and might be either two or three bedded, according to the production intended. The tanks serving for the preparation of the copper-zinc solutions should be connected by automatic siphons with the third and fourth tanks of the second terrace, which would take up the solutions as soon as they have cleared sufficiently. From these reservoirs the liquid may be conducted into copper cylinders, kept in rotation by appropriate machinery and filled with iron scraps—a contrivance which will enhance the speedy precipitation of the copper. Preferably, however, the recovery of both metals present should be effected in the electrolytic way, since the chemical methods serving for the separation of the zinc only allow of the separation of that metal in the form of oxide, and are rather tedious and expensive.

Other points observed during the treatment of the ore samples, as described above, were the following:

It was noticed, that the hydrochloric acid did not display the selective capacity for copper and zinc to the same degree as salt or nitre cake solution, and that, therefore, the liquids obtained by means of that solvent, contained a greater amount of iron than those resulting in the other way. The presence of the latter does, however, not prevent the successful precipitation of the copper, but seems to interfere to some extent with the recovery of the zinc in the quantities desired. It may, therefore, be necessary, in case the iron contents predominate largely, to remove them, after the electrolytic precipitation of the copper has been accomplished, so as to obtain a solution containing practically no other ingredients than zinc salts. It was found that this end could be readily obtained, and in an inexpensive manner, by precipitating the iron with lime, and subsequently electrolyzing the remaining clear solution.

Furthermore, it was observed that the introduction of gaseous hydrochloric acid into the water added, caused a gradual heating of the liquid, so that some lead, present in the samples, entered into the solution as chloride, which separated out on cooling in the form of a white precipitate.

Though the chemical principle, upon which the processes mentioned are based, was not realized unto the present—that is, the action of nitre cake or salt cake in aqueous solution upon pulverized copper and zinc ore—yet the selective capacity of sodium sulphate at higher temperatures has been taken advantage of in smelting operations years ago. In England especially the applicability of sodium sulphate for the separation of zinc from silver and lead in ores carrying these three metals has been realized, and a very efficient process established accordingly. Large works of this character are at present in operation there, and the results obtained argue very favorably for the extended utilization of this inexpensive and rather neglected or overlooked material for smelting purposes. This remark is especially true for that industry as carried on in the United States.

In the process under consideration the zinc contents of the ore pass into the slag, while the silver and lead settle in the bottom of the crucible or furnaces employed in the form of bullion. The zinc contents of the slag are recovered by roasting, when the metal volatilizes as zinc oxide, and is condensed in properly constructed flumes, while the separation of silver from the lead, which represents the final step of the operation, is then effected in the usual manner.

"Orthodox" and "Wild Cat" Oil Propositions.

NUMBER II.—CONCLUDED.

The following is a simple method for determining the dip of exposed strata with sufficient accuracy for practical purposes:

In Fig. 1 let P Q D C represent the surface of an inclined stratum. It is required to determine the direction in which it dips, and the angle at which it is inclined.

If a plumb-bob is suspended from a partly open rule, as shown in Fig. 1, and the open ends of the rule be turned in the direction of the dip until the plumb-line forms one side of a triangle with the two limbs of the rule, then the lower limbs G H will lie in the direction of the dip; for the plumb-line will only complete the triangle with the limbs of the rule when its lower limb is placed on I K, the line of greatest inclination of stratum P Q D C. This can be seen by turning the rule so that limb G H falls on line L M or N O, neither of which is the line of greatest inclination of the stratum. It will then be seen that, while the limb G H is in either of these positions, or any other position except the one which coincides with the line I K, the plumb-line and the limbs of the rule will not form a triangle.

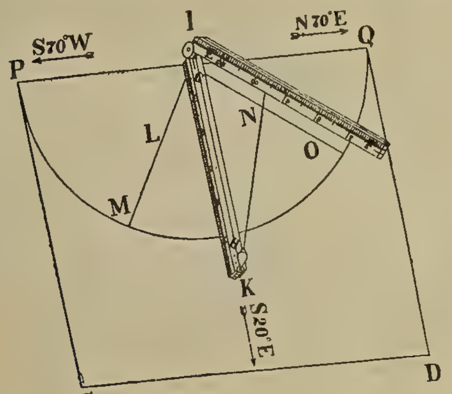


FIG. 1.

Diagram illustrating method of determining dip of exposed strata.

If E F, the upper limb of the rule, be placed in a horizontal position and the lower limb G H on I K, the line of greatest inclination, the side of the triangle formed by the plumb-line will be opposite the angle of the dip. The value of this angle may be found from the two sides of the triangle formed by a portion of the upper limb of the rule and the plumb line.

The angle of the dip may also be ascertained with approximate accuracy by carefully laying the rule, opened as explained in the preceding paragraph, on a piece of paper, drawing the angle and measuring it with a protractor.

Some rules are furnished with a clinometer scale, by which the angle formed by the open limbs of the rule is indicated.

It will be apparent to mathematicians that, if the upper side of the triangle be considered as radius, the plumb-line will represent the tangent of the angle of the dip; and if the hypothenuse, i. e., the lower side of the triangle, be considered as radius, the plumb-line will represent the sine of the angle of the dip.

As previously mentioned, the strike is always at right angles to the dip. Thus, in the case of stratum P Q D C, if the direction of the dip, as shown by line I K, is found to be S. 20° E., the strike will be represented by line P Q, at right angles to line I K, and the stratum will extend in a horizontal direction with a strike of S. 70° W., or N. 70° E.

Care should be taken that the surface of the stratum, the dip of which is to be ascertained, really is a bedding plane. It must be borne in mind that the bedding planes are seldom true planes, as they are subject to many inequalities.

Therefore, if possible, the dip should be estimated at several places on the same stratum, and the average of the results taken as the dip. In estimating the dip of a stratum of rock by this method, it is well to clear off a space on the surface of the stratum and to lay thereon a board, thus getting a better surface on which to work.

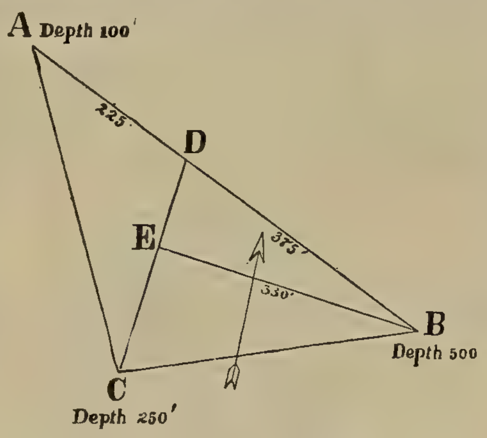

FIG. 2.

Diagram illustrating method of determining strike of oil sand stratum.

When a remunerative oil-yielding stratum has been discovered, its strike and dip should be determined by drilling three wells according to the following method:

In Fig. 2 let A, B and C be three wells in which the oil sand has been struck at 100′, 500′ and 250′, respectively, below any datum plane, such as a horizontal plane touching the top of well A. Draw A B, and let it represent a horizontal distance of 600′. If a point be found between wells A and B at which the oil sand can be struck at a depth of 250′ below the datum plane, a line drawn from well C to that point must necessarily be drawn along the strike of the formation; and if a line be drawn at right angles towards the strike of the formation and towards the deepest well, that line will necessarily be drawn in the direction of the dip of the formation. Moreover, the figures contain the elements from which the angle of the dip may be calculated.

The question is: At what point along the line A B will a well strike the oil sand at 250′ below the datum plane? The distance A B is 600′; the difference in the depth of wells A and B is 400′; therefore, the grade of the surface of the oil sand A and B is 400′ in 600′, or 2′ in 3′. Hence, wells situated along line A B and sunk to strike the stratum of oil sand, would, if measured from the datum plane, increase in depth as well B was approached, and the depths would be in proportion to the distance from A measured along A B.

It is required to find a point along the line A B at which the oil sand may be struck 250′ below this line, or 150′ deeper than at A. Since the increase in depth of wells which may be sunk from the datum plane to the oil sand along the line A B is at the rate of 2′ in depth to every 3′ of horizontal advance toward B, the distance from well A to the required point will be to the increase of depth of well at the required point as 3 to 2, or 1½ times 150′, which is 225′. Lay off A D = 225′. As point D is 225′ distant from well A, along line A B, a well sunk at point D will strike the oil sand at a depth of 250′ below the datum plane. Hence a line drawn from C to D will give the direction of the strike of the oil sand stratum.

Or the proposition may be stated thus: The grade of the stratum of oil sand between wells A and B is 400′ (the difference between the depth of the wells at A and B) divided by 600′ (the horizontal distance between the two wells), which gives two-thirds of a foot in depth to 1 foot along A B. Dividing 150′ (the difference of depth of wells A and C) by two-thirds of a foot, we obtain the distance 225′, which is the distance A D. Therefore, if a well were sunk at D, the oil sand would be struck at a depth of 250′. Draw the line C D. Now, it is evident that a well sunk at any point along C D would strike the oil sand at a depth of 250′. Hence, as stated before, the line C D is the direction of the strike of the oil sand stratum. Moreover, any line drawn at right angles to line C D, and in the direction of the deepest well, will be drawn in the direction of the dip of the formation.

It is now required to find the angle at which the oil sand dips, and this can be found as follows: From B draw B E at right angles to C D (the line of strike). This line E B is the direction of the dip of the formation. By measurement, we find that line E B is 330′. If a well were sunk at point E, it would strike the oil sand at a depth of 250′ below the datum plane. Therefore, the grade along the surface of the oil sand in the direction of E B is 250′ in 330′; and this grade represents an angle of about 37°. If the meridian be represented by the arrow in Fig. 2, then the oil sand penetrated by the wells A, B and C dips S. 80° E., at an angle of about 37°, and, consequently, the strike is N. 10° E.

When a remunerative stratum of oil sand has been struck and the angle at which it dips has been ascertained, as shown in the foregoing paragraphs, the distance from any of the wells, as B, to the point at which the oil sand ought to crop out at the surface of the ground, if it were on a level with the datum line, can be determined. This is done by the following method:

Let Fig. 3 represent a vertical cross-section drawn through the ground plan of Fig. 2, along line B E, and extended along the line of dip toward the outcrop. Let B b represent 500′, the depth of well B, and let E e represent the depth of a well which, if sunk at E, would strike the oil sand at a depth of 250′, as explained in the preceding paragraph. It is required to find the point at which the stratum of oil sand, struck in well B, ought to crop out at the surface of the ground, provided the surface were on a level with the datum line and not covered with alluvium. Through points b and e, or the top of the oil sand stratum, draw b e, and extend it until it cuts the datum line; the point where it cuts this line is at L. If the distance between B and L be measured, it will be found to be about 660′, which is the distance between well B and the outcrop. If the surface of the ground sloped upward from the datum line, as indicated by the outline H Y, it is evident that the oil sand would crop out at a point above the datum line. This point can be found by extending line b L till it strikes the surface. It is obvious that if the surface of the ground sloped downward from any point, such as H on the datum line, the outcrop would be below the datum line.

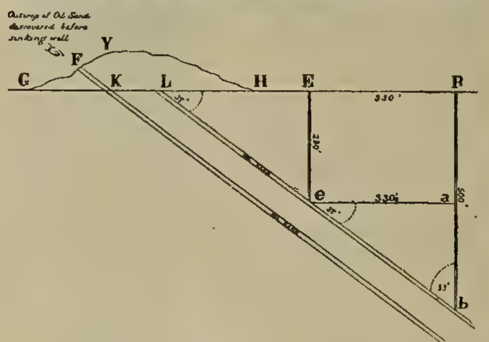

FIG. 3.

Diagram illustrating method of determining dip of oil sand stratum.

The angle at which the oil sand dips, and the distance from well B to the outcrop, may be found by measurement and the simple methods already given, with sufficient accuracy for practical purposes. But, if a closer estimate is desired, it can be obtained by the following trigonometrical formulas:

From the right-angled triangle a e b (see Fig. 3), of which a e = 330′ and a b = 250′, we have:

$$\text{Cot. of angle of dip } (a\ e\ b) = 330' \div 250' = 37^\circ\ 8'\ 48''.$$

From the right-angled triangle B L b, of which B b = 500′, and the angle a e b = angle B L b = 37° 8′ 48″, we have:

$$B\ L = 500' \times \text{cot. } 37^\circ\ 8'\ 48'' = 660'.$$

That is to say, the distance from well B to the outcrop at L, measured on the datum plane, equals the depth of the well multiplied by the cotangent of the angle of the dip.

If in the first instance an outcrop of oil sand had been discovered at point F, and well B had been sunk to strike it, then it becomes important to determine whether or not the previously discovered outcrop of the oil sand is identical with the outcrop of the oil sand as determined by calculation. It has been found that the angle of the dip would cause the oil sand struck in well B to come to the surface at point L or Y. Therefore, it is reasonable to suppose that the discovered outcrop which comes to the surface at F represents a stratum of oil sand underlying that penetrated by wells A, B and C. (See Fig. 2.)

If an outcrop of oil sand had been discovered at F and well B sunk, and oil sand had been discovered at 500′, it would naturally be supposed that the oil sand stratum discovered at point F had been reached. If struck a little sooner than expected, it might be accounted for on the ground that there is some irregularity in the dip; but when three wells are sunk and the dip, calculated by the method of triangulation already explained, shows that the stratum of oil sand struck in wells A, B and C ought to appear at L or Y, it is presumptive evidence that the outcrop of oil sand discovered at F is a stratum underlying that penetrated by the wells. When no outcrop of oil sand has been discovered, it is important to find out where the outcrop ought to be in order that some idea may be had on the ground as to the width of that portion of the oil line which lies between the well and the outcrop.

In all these calculations everything must be reckoned with reference to a common datum, which is preferably the horizontal plane passing through the highest or lowest part of the oil field in which the calculations are made. Oil fields should be developed by this method of triangulation, or some modification of it. In the development of an oil field in California it is expected that many cases will occur where the calculations will not tally with the results, for the reason that there are irregularities in the formation;

but, taken as a whole, progress by triangulation is the only safe method of procedure.

It will be evident to mathematicians that the calculations herein set forth may be made by various formulas.

From the foregoing paper it will appear that, although the element of risk is inseparable from petroleum mining, it is greatly diminished by competent and careful preliminary work, consisting of:

First.—A study of the structural features of the locality wherein operations are to be conducted.

Second.—By following a systematic method of triangulation for determining the strike and dip of the oil sand, and the site of new oil wells.

When a remunerative oil line has been discovered, it should be developed gradually; in districts where there has been much geological disturbance it is better to limit the distance between wells to about 300′.

If oil lines are discovered on both sides of an anticlinal fold, it is well to develop them simultaneously, by which means a correct idea as to the structure of the fold may be obtained.

By prospecting and developing territory on the lines mentioned in this paper, a few wells may be so located as to demonstrate in most instances the value of the territory; whereas wells drilled without due regard to the geological conditions of the locality demonstrate nothing more than the value of the rocks they actually penetrate, and several wells may be drilled which prove only the same fact instead of the group of facts on which the value of an oil field depends.

From the foregoing discussion it is apparent that the depth of oil wells depends on the angle at which the oil sand dips, and the distance the wells are from the outcrop of the oil sand, or from the axis of the fold or the fault line on which the wells are situated. As a general statement, it may be said that the most productive wells are about 1000′ in depth, some being much deeper.

The "life" and yield of such wells are naturally varied. Some wells are "spouters" and "start off" by flowing several hundred barrels of oil a day, but in most instances the flow subsides and the well becomes an ordinary "pumping well." In some instances wells have "started off" with a yield of 100 barrels or more a day by pumping, but in the course of from two to six years the yield has diminished to ten barrels or less a day. In other instances the first yield was less than 100 barrels a day, but the rate of production was better sustained during the "life" of the well. In some oil fields the wells are considerably less than 1000′ in depth, but, as a rule, their yield is not so great as that of the deeper wells.

The cost of drilling wells varies according to the accessibility of the locality where the well is situated, and the character of the formation penetrated.

The following statement as to the cost of drilling 1000′, exclusive of the cost of casing, is a consensus of opinion obtained by correspondence with several well known oil producers:

Locality.	Cost of Drilling 1000′.
Los Angeles and the Kern River district	$1,000 to $3,500
The Puente Hills	3,500 to 7,000
Newhall and territory on the north side of the valley of the Santa Clara river	5,000 to 7,500
The foothills of the Coast Ranges on the west side of the San Joaquin valley	2,000 to 7,000

A review of the oil fields in the Coast Ranges leads to the conclusion that the most favorable locality in which to drill "prospect wells" is one wherein a definite stratum of oil sand has been discovered in a formation belonging to a geological horizon known to include productive oil measures in other places; preferably there should be seepages of liquid petroleum at or near the locality in which prospect wells are to be drilled, and the angle at which the oil sand dips should not be more than 50° nor less than 10°.

The Burlap Process.

On page 610 an old resident gives a brief account of the gold bearing gravel bars of the Snake river, which winds between Oregon and Idaho. In further mention of the manner in which the gold is saved, the burlap process is worthy of note, as practiced by many an old miner along the banks of that river.

The method is as follows: A short sluice carrying a considerable stream of water is first prepared; attached to this there is an inclined table about 16 feet in width and from 10 to 20 feet in length. Where the table is 20 feet in length it is usually divided in its incline, that is, the first 10 feet adjoining the sluicebox is sharper in its incline than the last 10 feet, which is almost level with the horizon. There are flanges or a rim on each side of this table, 4 to 6 inches high, and through its center it is divided by a partition board, leaving each half 8 feet wide. On the first 8 feet of each length there is placed a quicksilvered copper plate, and over this is laid a sheet of burlap, usually of Manila bagging, firmly stretched and secured, so as to give an even surface to meet the current that is to pass over it. To the sluice there are screens attached for catching the coarse gravel and sand, and the gravel being shoveled into the sluice the fine sand, magnetic iron and fine gold particles soon reach the burlap sheet that is spread over the table. The current carries forward the sand and all lighter matter, and the short hair-like surface of the burlap retains the gold and black sand. Some of the gold particles penetrate the bagging and are caught on the quicksilvered plates. After exposure to the current for about twelve hours or less, the water is turned entirely onto one side, the burlap sheet on the other side removed and carefully washed in a large vat filled with water, where it is entirely freed of the particles of gold and black sand which adhered to it on the table. It is then replaced on the table, the current turned on again and the burlap on the other side treated in the same way. When the washings of these burlap sheets have accumulated to a considerable quantity in the vat, mercury is poured upon them and by means of an agitator the mercury is forced over and over and through the mass of auriferous black sand until it has taken up every particle of gold. The black sand or magnetic iron is then washed out and the amalgam renewed, the free quicksilver separated by forcing through felt or buckskin, and the remainder separated from the gold by fire.

Ralston Divide, Placer County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by
A. BORDEAUX.

The MINING AND SCIENTIFIC PRESS devoted considerable space in the issue of July 30, 1898, to the Ralston Divide Gold Mining Co.'s property, in Placer county, Cal. The following will give further information regarding the work done during the two years since:

The property embraces ninety claims, about 15 miles in length of the Ralston Divide, between Long Canyon and the Middle Fork of American river. This divide is comparatively virgin ground, only sufficient work having been done to prove the presence of gold in many places; some of the old works date as far back as the early days of California in 1850. Besides the mining ground, the company acquired several miles of ditches, the longest or Lambert ditch being 25 miles in length, and starting from a big dam on the American river at French Meadows. Other ditches, like the Long Canyon ditch, are 10 to 12 miles in length. There is a wagon road between the Divide and Summit Station, the highest point where the overland Pacific Railroad crosses the Sierra Nevada mountains, at an elevation of over 7000 feet.

The property belongs to the Ralston Divide G. M. Co., a California corporation, representing a French company—the Compagnie des Mines d'or du Long Canyon—composed entirely of French capital, with headquarters at Paris, 5 rue Scribe. The California office is at 214 Pine street, San Francisco. The directors are F. Chappellet, president; A. Bordeaux, vice-president and manager; H. W. Pulcifer, C. Rillict, H. Fabrigue; George W. Dixon, secretary.

Following is a full list of early hydraulic works on the Ralston divide: Pat Goggins, extensive hydraulic pit; Vaughn, small pits and shaft; Willard, small pits and 500 feet of tunnels in bedrock and gravel; MacPherson, 500 feet of tunnels in blue gravel; MacAllister, small pits; Ramsey & Poland, two hydraulic pits, extensive; Blacksmith Flat, large pit; Quartz Point and Quartz Flat, two extensive pits in white gravel; Marshall, Hillside and Red Cut, three pits in blue gravel; Ralston Pennsylvania mine, large pits in upper blue and white gravels; Diana, two pits and two tunnels in white gravel.

The Long Canyon's bed has been hydraulicked below Willard and below Blacksmith Flat.

From May, 1898, the following has been done:

At the Pat Goggins claim, 3500 feet of tunnels in full gravel, and breastings; output of $5000 during the prospecting operations of 1899. Granite mine, 700 feet of tunnel in full gravel. Ramsey claim, 100 feet of tunnel in gravel. Blacksmith Flat claim, 100 feet of tunnel in gravel. Lynchburg claim, 3150 feet of tunnels, partly in bedrock, partly in gravel. Red Cut, 1000 feet of tunnels in blue gravel. Total, about 8500 feet of tunnels. Most of this development work has been done in order to locate a deep gutter or river channel inside the Divide; but so far the channels have proved to be very wide and flat, except for a few stretches of shallow and richer gravel. In order to work profitably such wide channels, with no special concentration of gold, it will be necessary to operate on a large scale, rather than to try extensive underground works by drifting. Piping underground has been tried successfully in some places—in El Dorado and Nevada counties. This is the case when the gold is scattered over the full width and height of the channel, with occasional pay leads, but lacking in a concentration of gold in deep gutters, as in many of the mines of Forest Hill Divide, in Placer county.

Two of the mines are, and a third one may be, equipped for producing this coming winter—Pat Goggins, Lynchburg and Blacksmith Flat.

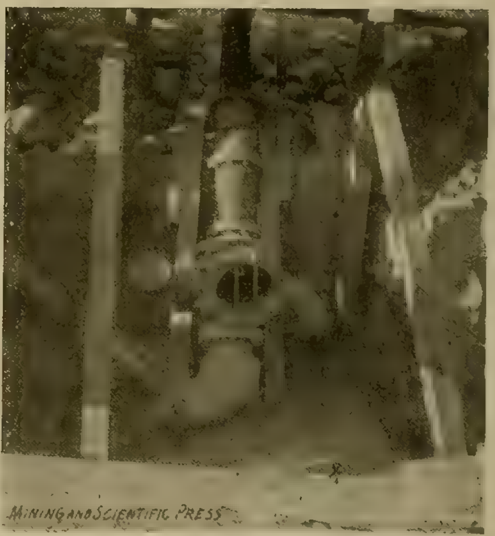
At the Pat Goggins an elevator will raise up the gravel 40 feet high, as the ground is flat. The ditches, reservoirs and pipe lines were completed last summer. The elevator, furnished by the Risdon Iron Works of San Francisco, is able to pass 100 cars an hour with a pressure of 300 feet and 600 inches of water. As the gravel inside was proving good last spring, work will be done by drifting at the same time as by hydraulicking outside.

Lynchburg is equipped with derricks and giants under a pressure of 350 feet of water. Ditches, reservoirs, pipe lines are ready.

Blacksmith Flat cannot dispose for the present of more than 80 feet of pressure, but there is another ditch to be completed next year, at which work was started already last summer, that will give about 250 feet of pressure and large capacity of water. Subsequently the other mines will be opened up and developed according to the first results obtained. A large undertaking like this cannot succeed without large expenses, as everything is to be done in a new and remote country. The locating of the Forest Hill channels has entailed an immense amount of expenses in prospecting tunnels by hundreds, and the Ralston divide is scarcely less extensive than the Forest Hill divide.

Elevator Sluice, Pat Goggins Mine, Ralston Divide, Placer County, Cal.

CHANNELS.—The development works by tunnels, and the different surveys have proved the existence of and located two different kinds of gravel, which, as it seems, belong to two different channels. So far there are no indications of any deep and narrow channels; on the contrary, all the gravel tunnels met with only wide stretches of flat river beds, between far distant and slow-grade rims. At the same time, the depressions along the exterior contact line of gravel and bedrock are of considerable length with a corresponding depth pointing conclusively to the sole existence of some broad outlets. As there do not appear to exist any deep and narrow outlets in any place all around the Divide, it is fairly probable that there are no deep or narrow channels.



Evans Elevator, Pat Goggins Mine, Ralston Divide, Placer County, Cal.

As both the white and the blue gravel belong to some wide and flat channels, it would seem as if they were two stratas in the same channel, and this opinion was expressed in a report of W. Lindgren on the old Yuba and American river channels. The white gravel is always at a slightly superior level above the blue gravel, and might possibly be its upper lead, now resting upon the cement, but now resting upon the bedrock, thus proving to be an independent channel. In the Forest Hill Divide the same white and blue gravels exist, with the same difference of level, and yet, according to Ross Browne's map, their channels are different altogether; the deepest one is the youngest. According to W. Lindgren, on the contrary, the deepest one would be the oldest; this is adverse to the facts, as, for instance, the modern rivers, being the youngest ones, have cut the deepest bed across the bedrock.

I am disposed to believe that on the Ralston divide the white and blue channels are different, but they may have run parallel, and even between the same rims in some places, and this still better explains the sole existence of very wide depressions of bedrock along the contact line.

In the Forest Hill divide there is a similar phenomenon, the parallel existence of a white and of a blue channel, at a slightly different level. The white Pond channel is different from the blue Mayflower channel, and is considered to be the oldest one; yet they run close by each other, even with an intersection right below Forest Hill.

If there are no deep and narrow channels in the Ralston divide, there may be some pay leads. Even in the widest rivers there are generally some deeper gutters, and such gutters in California are the regular channels of the miners, being the richest pay leads. To locate them is a much more difficult task than to locate the old river itself, and this was only done in the Forest Hill divide many years later, after the discovery of the auriferous gravels, and after the hydraulicking of the inlets, outlets and breakouts of the channels. Subsequently only to the discovery of a gutter in these inlets and outlets was it possible to discover a pay lead in a channel by tunneling across the bedrock, and by drifting. Drifting always follows hydraulicking. The Mayflower rich channel was detected after its very existence was demonstrated at Bath and Dardanelles.

This last period has not yet been reached in the Ralston divide, but the second period, the discovery of a pay lead in a wide river bed, seems to have been attained in the wide outlet of the Pat Goggins blue channel by drifting. Similar work is now undertaken at the Blacksmith claim. Elsewhere drifting under ground will be possible only after the development on a large scale of the big hydraulic mine at Lynchburg. There is a prosperous future for the Ralston divide mines. When the hydraulic mines are exhausted, then will start the drift mines.

It is exceedingly probable that the white and blue channels of this divide are the upstream course of the white and blue channels of the Forest Hill and Georgetown divides, their connections being Kentucky Flat and Michigan Bluff.

Before closing, I can not refrain from saying a few words on the old theory of an ocean beach to explain the California channels. An upheaval of the Sierras has not been proven as non-existing, and an ocean beach only seems able to explain certain difficulties, like the close vicinity of the very wide channels at North Bloomfield, Dutch Flat and Iowa Hill, some running to the Yuba, some running to the American river. The local miners and the geologists disagree as to the course of these channels. We are still far from knowing everything about the California channels.

Electric Power Transmission 153 Miles.

The Snoqualmie Falls Power Company, of Seattle, Wash., whose present 1200 H. P. hydraulic station has been given previous mention herein, conducted tests on the 13th ult., to show that electric transmission of power could be made commercially practicable at a distance as great as 153 miles. The experiments occupied several hours, during which the various services of the company were cut off; and the three-phase transmission lines were connected up in one continuous circuit commencing at the power house, running to Seattle, back to the hills, then to Tacoma and back again to the falls. The regular transmission is 32 miles to Seattle and 44 miles to Tacoma. In each case there are two circuits, one on one side and the other on the other of the pole line, arranged with a triangular spacing of 30 inches between wires.

The single continuous three-phase circuit 153 miles long was composed of 58 miles No. 264 (diameter in mils) aluminum wire, 4 miles No. 1 B. & S. G. medium hard copper, and 51 miles No. 234 (diameter in mils) aluminum wire, 36⅔ miles No. 2 B. & S. G. aluminum cable, 1⅔ miles No. 3 B. & S. G. medium hard-drawn copper and 1⅔ miles No. 0 medium hard-drawn copper. The apparatus used consisted of a Westinghouse 1500-kilowatt three-phase generator, used for producing the current, and a similar machine used as a synchronous motor at the end of the circuit.

With the 153-mile circuit open at the incoming end, the tests were made for charging it at different voltages, the alterations (7200) being kept constant. It was found that as the voltage increased the charging current rapidly increased; that is, at 22,500 line voltage it required 62 kilowatts to charge the line; at 30,000 volts it required 112 kilowatts, and at 35,000 volts it required 180 kilowatts. With the step-down transformers at the falls cut in and their secondaries open, it was found that the current required to charge the line increased; that is, at 22,500 volts it required 76 kilowatts, and at 30,000 volts it required 123 kilowatts. The voltage at the incoming end of the circuit, with charging current only on the line, was 24,600 volts when the impressed voltage was 22,500 volts, and 32,100 volts when the voltage at the outgoing end was 30,000 volts. Tests were also made to determine the different amounts of charging current required at different frequency, the voltage being kept constant at 30,000, and it was found that at 6000 alterations 100 kilowatts were required to charge the line, at 6600 alterations 105 kilowatts and at 7800 alterations 115 kilowatts. The line was then tested for loss of power in transmitting a non-inductive load consisting of the water rheostat, at the falls at the end of the 153-mile circuit, and it was found that the line voltage out was 30,000, incoming 22,500, drop, 25%. The amperes per phase at 1000 volts out was 624, incoming 554, loss, 11.2%. The total kilowatt outgoing was 1100, incoming, that is, delivered into the water rheostat tanks, 723, loss, 34.2%. A test was also made for charging current with the sub-station transformers at Seattle and Tacoma and the lowering transformers at the falls in circuit, but with secondaries all open, and it was found that with the 30,000 volts out, there was 31,500 volts in, and it required 193 kilowatts to charge the line.

A test was then made of operating a second generator as a synchronous motor at the end of the 153-mile circuit, and the machines were synchronized without any trouble whatever, but soon began pumping so that it was found advisable to separate the machines. The experiment was then tried of operating the water rheostat and the synchronous motor in multiple at the end of the 153-mile circuit, and the performance of the motor was very much improved. The water was then shut off from the water wheel and the driven motor immediately reverted to a generator driven by its own inertia; the current in the lines were reversed and the first generator became in turn a motor and ran at the other end of the 153-mile circuit until the inertia was expended.

Gold in Snake River Gravel Bars.

Written for the MINING AND SCIENTIFIC PRESS by
WM. H. WASHBURN.

The gravel bars of Snake river, in Idaho, Oregon and Washington, have attracted attention for forty years. Extending for hundreds of miles along this river, from its headwaters to its junction with the Columbia, these bars contain gold to the value of from a fraction of a cent to several dollars per cubic yard. The latter values are found in a very few spots and of limited extent, and when discovered are soon worked out by itinerant prospectors. Twenty years ago these best spots were a favorite resort of miners and prospectors in search of a grubstake, but they have nearly all been long since exhausted, so that the man with a pan and rocker has slim picking these days.

The source of the gold cannot, of course, be accurately determined. The generally accepted theory is that it is the finer particles from the placer deposits of tributary streams, its extreme fineness and usually flattened shape permitting it to be transported hundreds of miles along with the sand and gravel. In fact it travels much faster than the larger sizes of the latter. Some claim that the vast lava beds of southern Idaho (which are said to contain a small amount of gold) have contributed the greater portion of the values. In support of this theory it may be said that, so far as the writer has observed, fine gold is to be found in the streams draining any extensive lava formation in a mining country. Probably it has been derived from both sources.

Our investigations having been made from a point about 20 miles below Huntington, Or., to 50 miles above Ontario, these remarks will be mostly confined to what is to be found between these points.

The gravel ranges in size from fine sand to boulders seldom larger than a man's head. The current has a velocity of from 3 to 5 miles per hour. The gold is very unevenly distributed throughout these bars, being generally found in strata of medium sized gravel, from a few inches to a few feet thick, usually overlaid by from 2 to 10 feet of barren sand or gravel. Below these strata the gravel may also be worthless. Depth does not seem to cause any increase in values; where the bedrock has been reached at a few points on the rim it holds but little gold.

As a typical instance of values, on one claim I found about 18 inches of gravel at water level, from which I rocked from 75 cents to $2.50 per yard. It was overlaid by about 8 feet of sand practically barren; the gravel below being afterward proven to carry but little value. Another claim shows strata of from 2 to 4 feet thick and about 150 feet wide by about 300 feet long, carrying about 50 cents per yard, also overlaid by about 6 feet of barren sand, the underlay being barren for at least 6 feet to water level. These figures are given to give a fair idea of the pay streaks in general. There are open bars in places with no overlay, and where the pay streak is of sufficient depth they are generally preferred by those engaged in dredging. There are many pay streaks found some distance from the river, but usually under the conditions as to overlay above described. In some places there are strata of cemented gravel from 1 to 3 feet thick, but generally it is absent.

It may be useful to note the conditions under which these pay streaks are laid down, as indicated by the open bars along the river. We find the gold is deposited along the short or inner side of the curves in the course of the river. Any stratum of good gravel in the opposite bank has evidently been laid down at some previous time under the same conditions.

The accompanying sketch will show the occurrence of gold more clearly. The colors are coarsest at the head of the deposit, gradually becoming finer and fewer, and spreading out below, until the gravel is too poor to pay. As long as the river retains its course the pay streak will continue to form as the bar is extended from year to year, thus forming the larger deposits. One old resident worked a certain spot over for eleven consecutive years, a fresh deposit of gold being made by the annual June rise of the river. The average size of the gravel, as well as other signs, seem to indicate that the gold is only deposited where the current has a certain medium velocity. The valley is from 3 to 10 miles wide, and quite flat generally, the course of the river having from time to time swerved from side to side across its whole width. At the few points where the bends in the river are made more permanent by rocky banks, the pay streaks seem to be deeper and of greater extent than elsewhere. I have prospected bars on the Columbia river near Wenatchee and Brewster, and found the gold to occur under similar conditions, although it is a trifle coarser.

The gold above the mouth of the Boise river is very fine, averaging about 1200 colors to 1 cent, and is worth from $17 to $19 per ounce. Below the mouth of the Boise the gold is not quite so fine, averaging about 900 colors to 1 cent. The value is lower, being from $14 to $16 per ounce. It is always associated with black sand (principally magnetite) and a heavy reddish gray sand made up of minute rubies and other various colored crystals. When carefully separated the black sand contains only a trace of gold. Below Huntington, as far as I prospected, the most of the gold is evidently of local origin, being quite coarse, and nuggets of considerable size are found, although the pure gold from above is still in evidence in favorable spots.

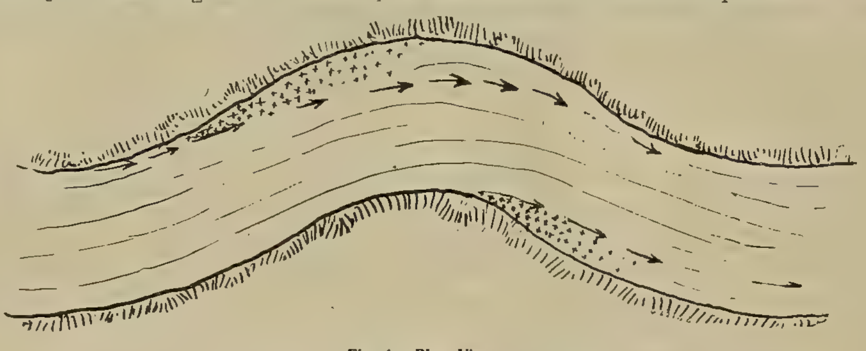


Fig. 1.—Plan View.

The crosses indicate the occurrence of the gold with relation to the bends of the river.

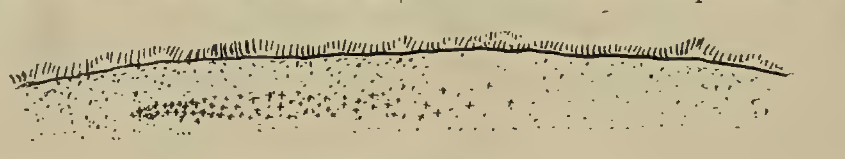

Fig. 2.—Horizontal View.

The crosses show the gold as it may occur in the opposite or long side of the bank of the river from a previous deposit.

MINING SUMMARY.

Specially reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

On Douglas Island the Alaska-Treadwell G. M. Co. has 880 stamps dropping on its four properties, as follows:

Treadwell	240
New Treadwell	300
Ready Bullion	120
Alaska-Mexican	120
"The 700"	100

In other mines around Juneau 234 stamps are dropping, as follows:

Alaska-Juneau G. M. Co.	40
Nowell G. M. Co.	20
Ebner Gold Mining Co.	15
Humboldt Mining Co.	10
Berners Bay M. & M. Co.	40
Alaska G. M. Co. of Indiana	10
Julian Mining Co.	10
Portland-Alaska	10
Early Mining Co.	5
Melen M. & M. Co.	20
Sumdum Chief G. M. Co.	10
Bald Eagle-Sumdum	4
Alaska-Willoughby G. M. Co.	10
Snettisham G. M. Co.	10
Windsor Bay mine	10
Windham-Ebner mill	10
Total	234

The Portland-Alaska G. M. Co. proposes resumption of operations on the Horrible, near Seward; a new tramway and ten additional stamps will be put in.

The Alaska-Treadwell mine during the month ending the 15th inst. crushed 30,077 tons ore, value $41,746, and 374 tons sulphurets, value $13,125; total product for month, $57,911; expenses, $38,000; average value of ore, $1.92 per ton. There were 540 stamps in operation; 300 of them, run by water power, dropped only four days, when the ice caused their closing down.

ARIZONA.

MARICOPA COUNTY.

A strike of rich ore is reported from the Midnight Test, Groom Creek.

YAVAPAI COUNTY.

Because of the recent cave at the United Verde, Jerome, the mill will probably be moved to a more stable foundation.

CALIFORNIA.

AMADOR COUNTY.

The War Eagle, near Plymouth, is bonded to Angels parties.——Ore is being taken out at the Fernando ranch, between Sutter Creek and Amador City, for a mill run at the Mutual, Sutter Creek.——The Bunker Hill, Amador City, is unwatered; shaft, now down 800 feet, will be continued.

At Defender, good ore is reported opened up on the Cleopatra.——A new drill is in at the Defender, and work on the 200 and 300-foot levels is progressing favorably; the stamp mill is running steadily.

New electric machinery is in at the Oneida, Jackson; fifty stamps are dropping; more men will be put on.——The new hoisting machinery at the Kirkwood is working successfully; sinking is in progress.

Work on the Peerless, Jackson, is progressing satisfactorily.

BUTTE COUNTY.

The well of the Feather River Oil Co., Oroville, is now in a dark blue shale; gas is flowing.

CALAVERAS COUNTY.

The Mountain King, Hodson, is closed down, the present plant being unable to handle the water.

The 900-foot tunnel on the Del Monte, at Railroad Flat, has reached the shaft; ore from the 38-inch ledge recently opened up assays $15.38 per ton.

Sinking is in progress on the Live Oak at El Dorado.——The Con. Gold Hill M. Co. will begin operations on the Gold Hill (gravel), on Esperanza creek, near Mokelumne Hill.

The Campo Seco Cop. M. Co. has bought copper property on the Simone Lozano ranch, near Lancha Palna.

COLUSA COUNTY.

The Mount Shasta Oil & Dev. Co. has put in a new rig on its property at Arbuckle and will begin drilling soon.——R. W. Gorrell is sinking a new well.

EL DORADO COUNTY.

The Eagle G. M. Co. is hydraulicking on its property near El Dorado; Manager G. Walker.——The Wyllie, at El Dorado, is leased to the management of the Live Oak.

INYO COUNTY.

The King Con. M. Co. projects a mill on its property near the Redlands mill, at Ballarat.

KERN COUNTY.

The Oriental Oil Co. has struck oil sand on 30, 32-24, Bakersfield.——The Monte Cristo Oil Co. is laying a pipe line to the railroad.——The Navajo Oil Co.'s No. 2, at Sunset, is in the oil.——The Kern Oil Co.'s No. 2, Bakersfield, is producing 500 barrels oil per day.——The Mt. Diablo Oil Co.'s No. 2 on 30, 28-28 is down 900 feet.——The Monarch Oil Co.'s No. 2, on 2, 11-24, Sunset, is flowing.——The Giant Oil Co. is making arrangements to pipe oil to McKittrick.——The Monarch Oil Co., at Sunset, is putting in a pumping plant.——The Del Ray Oil Co. will put in three rigs on 5, 29-28, and begin drilling.——The Cantua Oil Co., on 14, 28-27, has a showing of oil at 1000 feet; oil sand is expected to be found at a depth of 1200 feet.

The California Standard Oil Co.'s well at McKittrick is flowing steadily.——The Corona Oil Co. is down 1500 feet in its first well.—At Sunset, on 31, 32-24, the Lucky Boy Oil Co. is down 400 feet.——The Sunset Standard Oil Co. will begin drilling on 20, 11-23.——The Golden Gate Oil Co., which recently struck oil on 34, 12-24, has suspended operations until an under-rimmer is put in.——The Lincoln Oil Co., of Oakland, is drilling on 14, 28-27, Bakersfield; 14-inch casing is used.——A new 26 H. P. engine is in at the Buckeye, near Randsburg.

Oil is reported found at a depth of 1190 feet, on the Common Sense property at Temblor.

The Butte Lode M. Co., operating the Butte, at Randsburg, last week shipped to Los Angeles two gold bars worth $4200; result of a mill run of seventy-two tons of ore; twenty men are employed.

LASSEN COUNTY.

Work on the Daisy Dean, at Hayden Hill, is suspended.

LOS ANGELES COUNTY.

The Coalinga oil lands, owned by Chansler & Canfield of Los Angeles and W. H. H. Hart and others of San Francisco, are reported sold to an English company for $1,850,000.

MARIPOSA COUNTY.

The new mill at the Mariposa, at Mariposa, is ready; sinking will be resumed.

NAPA COUNTY.

The Mount Shasta Oil Co. has completed a road to its property in Berryessa canyon; it is putting in a new derrick also; a second gusher is opened up; oil from this well sells readily in San Francisco.

NEVADA COUNTY.

The Diamond, near Grass Valley, is bonded; work goes on under Manager Murphy.

Dunlap & Thomas, operating the Lecompton, at Willow valley, have twenty men working; ore is being mined, and it will be shipped to the Selby Smelting & Lead Co., San Francisco.

The Boston & Grass Valley G. M. Co. is incorporated at Nevada City.

The twenty new stamps are in at the Empire mill, and now forty stamps are dropping on ore from the mine; the work of tearing down and replacing the other twenty stamps will begin next week.

ORANGE COUNTY.

The Union Oil Co. has over 1400 feet of 11⅝-inch casing in one of its wells in Brea canyon, near Fullerton.——The Columbia Oil Co.'s No. 9 is expected to produce 50 barrels, and No. 10 is expected to turn out from 75 to 100 barrels oil per day; the company will put in rigs and start two new wells soon.——The Fullerton Oil Co. has another well completed.

PLACER COUNTY.

Work is resumed on the old copper mine at Old Whiskey Diggings, near Sheridan.——A strike of rich ore is reported made on the Herman, at Westville.——Supt. T. G. Durning is retimbering the Grey Eagle tunnel, Auburn.——Rhodes & Collins are cleaning out the old shaft on the Crater, at Ophir.——The Malmberg mill is running on ore from the Rocky Ridge.——The Never Sweat is sold to J. Johnson.

On Turkey Hill (gravel), El Dorado Canyon, Michigan Bluff, a new electric plant consisting of two 60 H. P. generators, etc., are in; power will be distributed as follows: Mill, 35 H. P.; compressor, 35 H. P.; electric locomotive, 20 H. P.; hoisting, 7½ H. P.; pumping, 7½ H. P.——Miller & Son are working the Lost Camp at Blue Canyon.

SAN BERNARDINO COUNTY.

The Colton Cement Works have closed, with little prospect of reopening. The works have changed hands and management several times within a few years.

SAN DIEGO COUNTY.

The Free Gold M. Co. has its 100-stamp mill and cyanide plant at Hedges running steadily.——The new stamp mill going in on the American Girl group is nearing completion.——The New York Oil Co. will drill for oil on the beach near Oceanside.——The Monarch well is down 1000 feet.——At San Marcos the well on the Kelly ranch is reported down 1000 feet.

A drilling outfit is going in in the Carisso creek district, near Temecula.

SAN LUIS OBISPO COUNTY.

E. Smith has brought suit against A. A. Dubost for alleged misrepresentation of value of the Adelaide (quicksilver).

SHASTA COUNTY.

The Trinity Copper Co. of Boston are locally credited with intention to build a new smelter above Copley on the Sacramento river.——The Shasta Con. Oil Co. is putting a No. 1 Standard rig on its property on Cow creek, east of Bella Vista.——The vertical shaft in the Mount Shasta, in Clear Creek section, near Shasta, is down 340 feet; sulphides are opened up at this depth; sinking will be continued to 500-foot level.——On the Blackstone and Isabelle Bell 350 feet of tunneling and 280 feet of drifting are completed; a 145-foot shaft is sunk.——On the Oro Fino the lower tunnel is in 250 feet; ore assays $2.50 to the ton.——A 400-foot tunnel is run on the White Rose, south of the Mount Shasta.——Two shipments of ore from the Anaconda recently returned $30 per ton.——A new prospect tunnel is being run on the Golinsky (copper), near Kennet.

SISKIYOU COUNTY.

Manager H. Miller is pushing work on the Bonanza group, at Fort Jones; $10,000 will be spent in prospecting, and if results are satisfactory a plant will be put in.

The Siskiyou Placer M. Co. has bought the Montezuma Hill, Independence creek, near Yreka, containing 124.48 acres, and two-thirds interest in the Clear Creek, for $6000.

A rock crusher, two concentrators and a Pelton water-wheel are in on the Brown Bear and Fraction group.——A recent crushing of ore from the Rohm, on White's gulch, gave $60 to the ton.——The lower crosscut tunnel on the Golden West will be extended to tap the ledge at greater depth.——Good ore is being taken out at the Protection.——Men are working on the Eddy (placer) and a good cleanup is expected.——The Pittsburg Dredger Co. will build a dredger for use on property on South Fork of Scott river.——Ore from the Polar Bear, at Callahans, is said to run $50 in copper to the ton.

Supt. J. McKeene of the Helena G. M. Co., operating on Boulder creek, near Callahans, is pushing work on the new forty-ton mill and the cyanide plant.——The Yreka M. & M. Co. are getting out ore to run the full twenty stamps.——Two Chinese companies are mining on the Klamath river—one at Virginia Bar ferry and the other at the mouth of Vesey creek.

STANISLAUS COUNTY.

E. P. Newhall, associated with Alvinza Hayward in development of quicksilver mining properties near Grayson, says that sinking on the Adobe Valley property was discontinued at a depth of 180 feet; too much water. Crosscutting for the vein is in progress at that depth. Fourteen men are employed.

At the Summit quicksilver mine, owned by the same parties, a tunnel is in 700 feet, and it is expected will cut the vein at 400 feet—250 feet deeper than the old workings.

TRINITY COUNTY.

The new dredge, built by C. D. Galvin, for use on Weaver creek, near Weaverville, is ready for work.

The Last Chance G. M. Co., operating the Paulsen placers, below Lowden's, will develop other properties in this county next year.——The Sykes Placer M. Co., operating the old Bloss & McClary, at Trinity Center, has put in new pipe and will operate another giant.

TUOLUMNE COUNTY.

The Mt. Hood M. Co., capital stock $129,000, is incorporated at Jamestown.——Sinking from the 1700-foot level of the Rawhide is resumed; shaft will be sunk to the 2000-foot level.——McGinn Bros. are sinking a shaft on the Golden Rule, south of Stent.——Developments at the Tri-Color, Tuttletown, show good results.——More men are put on at the Mount Hood, and sinking is in progress.——Lucas and others are working property on Jackass hill, near Tuttletown.——The Mack, at Big Oak Flat, is temporarily closed down; a new hoist will go in and a new shaft will be sunk. A new 20-stamp mill, 50 H. P. air compressor, pump, etc., is projected, to be run by electric power.——The Graham mill, on Sawmill flat, near Columbia, is crushing ore from property on Five Mile creek.——The pocket recently opened up on the Hudson, on Bald mountain, yielded $4000.

The Longfellow, at Big Oak Flat, has resumed operations, the misunderstanding over the wage question being satisfactorily settled.——Sinking is in progress on the Rhode Island, at Groveland, and a station is being cut on the 400-foot level.——The other ten stamps at the Mt. Jefferson are dropping.——The Mack Con. M. Co., Big Oak Flat, has suspended operations for the present; a new plant will go in and sinking continued to 1000-foot level.——At Sonora, night and day shifts are sinking a shaft on the Hazel Dell.——The Grape Vine M. Co. has bought the Lost Fox for $15,000; water-power, with a head of 700 feet, is available.——At the 800-foot mark in the tunnel on the Golden West, a 6x8-foot raise to the surface is being run; when completed the 6x10-foot shaft will be continued to the 300-foot level; machinery for the new mill is on the ground, and Supt. Restano expects to have the stamps dropping by May 1st.

A good body of ore is reported opened up at a depth of 520 feet on the Norwegian, near Sonora.——The shaft on the Black Oak is down 1200 feet; the cyanide plant is running steadily.——A good body of ore is opened up 1½ miles from Stevens' Bar.——Operations on the Neale, on Portuguese Gulch, near Sonora, are progressing.——The Oleson, at Golden City, 5 miles from La Grange, maybe reopened and worked as a copper property.——The shaft on the Goldwin, Sonora, is down 300 feet.

At a depth of 20 feet on the Standard, near Soulsbyville, the vein has widened to 10 inches, carrying free gold; if tests prove satisfactory a complete plant will be put in.

Work on the Kodak, Carters, will start Jan. 1st.——On the Bald Mountain, above Brown's Flat, Wainwright & Elsbree recently took out $4000 in one week.——Sinking the Black Oak shaft, now down 1200 feet, will resume Jan. 1st.——The new mill on the Goldwin will be up April 1st; Supt. McClintock.

COLORADO.

BOULDER COUNTY.

The Emancipation, at Sunshine, will probably be sold to New York men for $275,000; the mine is producing high-grade sylvanite; forty-five men are employed; during 1900 it has produced $3000 to $5000 per month; over $10,000 have been taken from the dump alone.——The Culbertson mill, at Culbertson, 4 miles east of Boulder, is leased to Newhouse & Frank; it was recently overhauled and remodeled; capacity 300 tons per day.——The Slide, at Gold Hill, is operated under the leasing system, more than fifty leasers working on the property; W. Teller, owner.——The Melvina, at Salina, is operated by the Great Eastern G. M. Co., J. E. Harriman of Boston, Mass., Supt.; main shaft is down over 700 feet; during last five months sales of ore have amounted to over $20,000; a recent shipment of thirteen tons of ore returned $1650 to the ton; a 3500-foot adit tunnel is being run on the vein, and it is expected to cut the shaft at the 800-foot mark.——The Denver Trans., Tunnel & Drainage Co. is organized; a 10x8-foot tunnel, 1500 feet long, will be run into Chittenden mountain, near Boulder.——One hundred feet of sinking on the Denver group is just completed.——The 2000-foot Mogul tunnel is completed.

CHAFFEE COUNTY.

On the Belle of Granite, Granite, fifteen men are employed; a car of ore netted $1550.——The Tasmania M. Co. is pushing work on the Tasmania at Winfield; the company expects to blow in a smelter.

CLEAR CREEK COUNTY.

The Cleveland, at Idaho Springs, will be worked on a large scale by P. Mixsell and eastern men; a new hoisting plant is in, and sinking will be pushed during next year.——The Foxhall tunnel property, on Seaton mountain, near Idaho Springs, consisting of seven patented claims is sold to Milwaukee men for $25,000; men will be put on, and work prosecuted during the winter.——The John Owen Co. is preparing to erect a 100-ton concentrator at Idaho Springs to treat ores from the Freighters' Friend and Arundel mines sinking and drifting are in progress on the Freighters' Friend, and the shaft of the Arundel is being unwatered.

The Mendota, at Silver Plume, is shipping lead and silver ore; a new compressor and boiler are going in; compressor and boiler rooms, and the Maril tunnel and shaft are lighted by electricity; new men are being put on daily; mill is running steadily.——It is said the Pelican-Dives Co. will spend $50,000 in development next year.——Friesell & Erickson, operating on the Pelican-Dives, have opened up a streak of high-grade ore, mill returns from twenty tons of which gave 200 ounces silver to the ton.——C. S. Desch & Co., operating the Corry City, have just opened up a good body of ore carrying silver, lead and a little gold.——Pureneau & Kendall are doing considerable work on the Pay Rock.——The shaft on the Smuggler will be sunk 200 feet deeper.

The Colorado & Southern has fixed a 60-cent per ton rate on mill dirt and other low-grade material from Black Hawk to

Dumont, value in any case not to exceed $10 per ton crude.

The Allan mill, on Chicago creek, near Idaho Springs, which was recently remodeled, is running under management of E. C. Braggs.——The Bertha G. M. Co. will work twenty-two claims in Pleasant Valley district; a new 22 H. P. engine is in.——The Yankee Con. M. M. & Tun. Co. will work its property at Yankee during the winter.

EAGLE COUNTY.

P. Breene will sink a 600-foot shaft on one of his claims at Kokomo.——A company is being formed to work the Little Gold Dust group.——The Mendota mill is being overhauled and improvements are going on; W. H. Miller, manager.

FREMONT COUNTY.

The bed from which the Colorado Portland Cement Co. obtains its raw material is along the south side of the Arkansas river valley, 6 miles east of Florence, at Portland. The necessary ingredients for making Portland cement are said to be already mixed by nature in practically the correct proportions. Near the site of the mill rises a shale bluff, 300 feet thick, underlaid by a 50-foot stratum of limestone. Extending along the edge of the valley is a deposit of the Niobrara period of the cretaceous formation.

The Florence Oil Co. is putting up another rig 5 miles southeast of Florence. Weaver & Co. have well No. 4 in pumping order.——Natural gas, struck at Hooper recently, is being put to practical use, and the field will be developed.——The Sedalia, at Salida, is shipping ore to the Rocky Mountain smelter at that point

GARFIELD COUNTY.

A company is organizing at Glenwood to prospect the mineral resources near there.

GUNNISON COUNTY.

The Colorado S. M. & M. Co. has driven its West Mountain tunnel, at Pitkin, in 88 feet; work will continue through the winter.

HINSDALE COUNTY.

A strike of high-grade ore was recently made in the tunnel of the Golden Fleece, near Lake City.

LAKE COUNTY.

The year's shipments from the Resurrection mine will aggregate about 45,000 tons of ore, comprising oxidized iron and lead carbonates, the values being gold, silver and lead. These shipments are from the two shafts, 800 and 760 feet deep, respectively, and 1700 feet apart.

Leadville, Dec. 16.

The output of Leadville mines at present foots up to 2800 tons per day, which may be classified as follows: Smelter iron ore, 850 tons; lead carbonates, 250 tons; dry sulphides, 400 tons; dry siliceous, 300 tons; lead sulphides; 500 tons; manganese oxides, 300 tons; zinc sulphides, 200 tons. The zinc ores carry a small per cent of lead and usually about 43% zinc; and these are produced mainly by the Moyer and others. The Iron-Silver, Ibex and Monarch furnish the most of the dry sulphides and the siliceous ores come mainly from the Ibex and Penn. The iron-silver ores in the main are supplied by the Home group, Moyer and the leasers on Tryer hill, while the Small Hopes, A. M. & W. and Mab ship most of the lead sulphides. The carbonates come in the main from the various properties on Carbonate hill. The Modoc, Phœnix and Sixth Street mines in the main ship the manganese, the Morning and Evening Star group shipping an oxidized iron.

Leadville, Dec. 20.

The Greenback, owned by S. Wood and associates, has not shipped for some time by reason of a surfeit of water. The shaft is 1100 feet deep, which for a time filled up to near the 900-foot station with water. To keep the mine unwatered a 1000-gallon, 1100-foot lift pump is being put in place at the 1100-foot station. Three 125 H. P. boilers will furnish power.

Leadville, Dec. 21.

The Denver & Rio Grande and the Colorado & Southern railway companies have extended branch lines and spurs to practically every mine within the Leadville district. The prevailing method here now is to build a trestle from the ore landing floor of the shaft house over the railroad track, extend ore car trackage out upon the trestle and dumping the cars from the mine into the railway cars below. At some mines twelve railway cars stand below the trestles waiting to be loaded with ore.

Leadville, Dec. 18.

The Josie group, comprising a tract of 70 acres on Big Evans gulch, lying northwest of the Resurrection and adjoining the Dollie B., is being developed by Montana men, J. H. Henley, Supt. of the Ibex. A shaft has been sunk 530 feet in depth, from the 400-foot station of which crosscuts are being run both north and south, with also a crosscut southward from the 275-foot station.

Leadville, Dec. 20.

The old Robinson, in Ten-mile district, near Leadville, will be operated by Eastern men.——The Weldon, Leadville, is closed down temporarily while repairs to hoist are being made.——The P. O. S. is shipping ore steadily.——The Rock Hill Con. M. Co. has decided to resume operations on the Nil Desperandum shaft, at Leadville.

A strike is made on 475-foot level of the Rose Emmet, Leadville.——The A. M. W. Co. has put in a new settling tank at its new concentrating plant to catch flour lead passing off with surplus water.

The International Prospecting D. & M. Co. at Leadville will begin drilling on Valentine No. 2 with a new Keystone driller, capable of drilling a 6-inch hole down 2000 feet; it weighs 23,300 pounds.

The plant of the Harrison Reduction Co., at Leadville, is to be converted into a big concentration mill.

MINERAL COUNTY.

The Big Kanahwa Leasing Co., operators of the United mines, shipped about 1000 tons of ore from the latter in November. The main shaft is 1175 feet deep, and it is the purpose to sink 300 feet deeper to the level of the Wooster tunnel, by which the mine is to be drained. The ores are lead sulphides, carrying gold and lead values. They seem well adapted to concentration, and plans are being made for a concentrating mill, to be located near the mouth of the Wooster tunnel, the ore to be sent out through the latter. The vein on this property ranges from 8 to 12 feet wide. This is the same vein which passes through the Commodore, Bachelor, Amethyst and Park Regent. To a depth of 400 to 500 feet the ores were siliceous and high in silver, with no lead; and at greater depth the silver values disappear, the ores being a lead sulphide, with good gold values.

Creede, Dec. 21.

PARK COUNTY.

Schlessenger & Son have a bond and lease on the Last Chance, near this place. Recent work shows an ore body about 30 feet wide, the ore being a siliceous silver-lead material, carrying silver-lead values, with some gold. Small shipments have been made, but the ores are specially suited to concentration and the intentions are to erect a mill for this work. The Last Chance ore body is the same as that so well opened on the Hill Top, in the same locality. The vein on the latter is phenomenal, in one place the workings showing the ore to have been taken out to a width of 15 to 40 feet between walls and 500 feet vertically, without timbers or other support. About 1,000,000 tons of ore have been mined from the Hill Top. A 3-mile tramway line carries the ore from the mine to the concentrator at the railroad track.

Fair Play, Dec. 18.

Sixty-dollar ore is being shipped from the Ironclad, at Alma.——The Gold Dollar Co. announces output for November as 600 tons, worth $21,000.——The reported consolidation of the Golden Dale and Moose properties is denied.

A Milwaukee, Wis., company will build three dredgers and begin operations in the Platte river near Fairplay.

PITKIN COUNTY.

At Aspen the large Norfolk compressors of the A. J. are removed to the Mollie Gibson; the thirteenth level of the latter is cleaned out and ore will be mined.

SAN JUAN COUNTY.

The Kendrick-Gelder smelter is operating satisfactorily on ores produced in this vicinity. Considerable iron and copper ores from Red Mountain may be supplied next year.

Silverton, Dec. 24.

The Silver Lake group, at Silverton, is locally reported sold to the American Smelt. & Ref. Co. for $2,500,000.

The tunnel on the Emma, at Silverton, is in 700 feet.

SAN MIGUEL COUNTY.

The Silver Bell, at Telluride, is being developed steadily.——Good ore is being taken out of the Suffolk properties.

SUMMIT COUNTY.

The Mecca Co., operating in French gulch, near Breckenridge, will probably put in a steam plant in the bedrock shafts to replace the horse-whim is now in use.——The Gold Pan Placer Co., operating on the Blue river, will soon begin work on a large hydraulic system, which will be finished by next summer.——The Blue River G. Excavating Co. will start operations on the Blue river next spring.

TELLER COUNTY.

The Columbine-Victor Tunnel Co. will operate motors of twenty-five cars pulling capacity in the tunnel.——A new 4-drill compressor is in at the Last Dollar; it will be used until arrival of a new 12-drill compressor.——Returns from twenty-two tons of ore, recently shipped from the Zenobia, give 1.335 ounces to the ton.

A strike of $125 ore is reported found on the 125-foot level of the Frank S., on Raven hill, Cripple Creek.——At a depth of 500 feet in the working shaft of the Hidden Treasure, on Bull hill, a streak of ore running $1000 to the ton is opened up.——The shaft on the Louise E., on the saddle between Squaw and Grouse mountains, is being sunk on a wide vein of quartz running from $8 to $70 to the ton.——The stockholders of the Grace Greenwood Co. have decided to sell out for 80,000 shares of Anaconda stock.

J. H. Hammond has begun work on the Independence, at Victor; sinking and drifting are in progress.

In the 850-foot level of the Gold Coin, Victor, sylvanite ore is being mined; a station is being cut on the 1000-foot level; 100 tons of ore are produced daily.——A strike is reported on the Washington claim of Stratton's Independence.——Pres. J. F. Burns of the Portland G. M. Co., Victor, thinks there are 6 miles of development work done on the Portland and that over 60,000 tons of ore have been marketed, returns for which foot up between $3,500,000 and $4,000,000.

Ore recently opened up on the 850-foot level of the Anaconda, Cripple Creek, shows sylvanite and assays $120 to the ton.——Two and one-half tons of ore recently shipped from block No. 2 of the Deadwood, at Independence, returned $1300; ore was taken from the 570-foot level.

IDAHO.

BLAINE COUNTY.

The Crœsus G. M. Co. will put in a compressor and a hoist on the Crœsus, at Hailey, next spring; it will also add twenty or thirty stamps to the ten now on the property.

The Minnie Moore mill, at Hailey, will be repaired and started up in sixty days; thirty men will be put on.——The Relief will also resume.——A new company is being organized in the East to work the Hope.

Work on the Tiptop is progressing.——Work on the Black Cinder will be resumed.——The Golden Star mill will resume operations next spring.——Between 30,000 and 50,000 tons of ore are reported in sight on the Jumbo; the mill will run in the spring.——A 20-stamp mill will go in on the Liberal and Maggie May group next spring.——The mill on the Tyrannis will start up again next spring.——Wall & Keith will work the Bullion next spring.

CANYON COUNTY.

P. Pence and others are developing a quartz prospect on upper Squaw creek, near Walker's mill, at Payette; a tunnel is being run.

ELMORE COUNTY.

On the 300-foot level of the Crown Point, at Mountainhome, a 200-foot shaft will be sunk, and if ore continues good a smelter will be put in; sixteen men are working.

IDAHO COUNTY.

Operations on the Big Buffalo, at Buffalo, will be resumed by Manager Stevens; shaft, now down 24 feet, will be continued.

KOOTENAI COUNTY.

The newly incorporated Cœur d'Alene M. Co., formed to work claims in the Hayden Lake district, a few miles from Lake Pend d'Oreille, is pushing work on the properties. The claims are the Phillipps No. 1, Phillipps No. 2, Daisy, Ellen and Gordon.——The Blue Bird, in Lake Pend d'Oreille, of the Black Tail Mountain M. Co., recently shipped fifteen tons of ore which returned $969.33 net, or $64.62 per ton.

LATAH COUNTY.

The Syndicate, on Gold creek, 30 miles east of Kendrick, is sold to Seattle men; supplies are going in and work will be pushed; two shifts will be put on, and a shaft sunk.

LEMHI COUNTY.

Ore from the Grunter, near Salmon, runs from $20 to $50 gold to the ton.

W. W. McDowell has an option on the Copper King (copper), on Beaver creek, near Salmon.

OWYHEE COUNTY.

The Westinghouse Electric & Mfg. Co., putting in the electric power plant at Swan Falls, on the Snake river, 30 miles from Silver City, for the Trade Dollar Con. M. Co., expects to have it running this week; plant consists of three 300 K. W. dynamos, four turbines driven under a head of 15 feet; cost of entire plant, including dams, etc., is estimated at $250,000; current will be transmitted to the Trade Dollar, at Silver City, for power and lighting purposes.

SHOSHONE COUNTY.

There is enough placer ground on Beaver and Trail creeks, near Delta, to keep up operations for thirty years.——Starr & Coulson are working the Ribbon, near Murray.

Three shifts are working on the Standard tunnel; latter is in 900 feet; an additional 2000 feet will be run to tap the ledge; progress is at rate of 150 feet per month; the 600-foot station is nearly completed; an electric locomotive will be put in, track for same being nearly completed; 240 men are employed; J. R. Finley foreman.

Busen & Brooks have just completed 1200 additional feet of flume near Delta.

The mills of the Morning and Hunter mines, at Wallace, are handling 1300 tons of ore daily, producing 150 tons, or six carloads, of concentrates.

MICHIGAN.

HOUGHTON COUNTY.

A conservative estimate of the cost of a new mill in Houghton would be $50,000 per stamp; some of them have cost $75,000 per stamp; the new mills range in size from two to four stamps each. The Franklins' new mill cost $300,000.

MONTANA.

MADISON COUNTY.

Twenty-five men are working at the Broadway, at Silver Star; foreman, J. W. Martin.——The Hungry Hollow is reported sold to J. N. Kirk, W. Forbes and J. Emslie of Butte; a leaching plant will probably be put in.——C. E. Damours, operating the Kearsarge, at Summit, near Virginia City, is shipping high-grade ore; he will put in a 5-stamp mill on the property.——A strike is reported made on the West or Owsley Mayflower.

SILVER BOW COUNTY.

The Bell, Diamond, Mountain Con. and Agreen Mountain, four Anaconda mines employing 1500 men, and which shut down some time, have resumed.

Reports of estimates of mineral outputs of Butte mines for 1900 are as follows: Anaconda, $20,466,706; Boston & Montana, $12,783,185; Butte & Boston, $3,956,000; Montana Ore Purchasing Co., $3,404,000; Parrot & Co., $3,341,352; Colorado Co., $3,075,000; W. A. Clark mines, $2,472,000; Speculator mine, $3,200,000; Washoe Co., $667,932; other mines, $50,000. Total, $53,419,175.

What is said to be the richest streak of gold-bearing ore ever in Montana was last week opened up near Rocker, across Silver Bow creek; ore assaying $100,000 to the ton was found at a depth of 26 feet.——Mullins & Buckley, operating the Shamrock, near Garnet, have opened up ore running $70 to the ton; two carloads of ore recently shipped to the East Helena smelter returned $1600 per car.——The Excelsior M. & Smelt. Co., capital $200,000, is incorporated at Butte.

In Brown's gulch, near Butte, a strike is made on the Honduras, Fortune's Car and the Vent, and extensions of the latter. Ore taken out has run from 90 ounces silver and $5 gold up to 250 ounces silver and $12 gold to the ton.

NEVADA.

ELKO COUNTY.

A recent shipment of ore from the Monarch of Spruce mountain returned $40 to the ton.

ESMERALDA COUNTY.

The Silver Peak mines at Hawthorne are sold to the Silver Peak G. & S. M. Co. of New York for $600,000.

LINCOLN COUNTY.

Referring to the approaching sale of the plant built by the Mineral Union Co. at Goodsprings, Prof. H. Hirsching writes stating that he is in no way responsible for the sale, and that his process is not the cause thereof.

LYON COUNTY.

The Kossuth, at Silver City, will probably resume soon; E. B. Rail, owner.

STOREY COUNTY.

On the 1000-foot level of the Caledonia, Virginia, the drift started from a point 195 feet in the west drift from the incline upraise from a point 400 feet in the southeast drift, 1100-foot level, is out 74 feet; face in hard quartz and bunches of porphyry, quartz assaying $4.32 to $7.19 per ton; the west crosscut No. 1 is in 68 feet; formation vein porphyry and seams of quartz.——During week ending Dec. 20, ten cars of ore were extracted from 900-foot level of the Overman; value, as per car samples, was $17.38 per ton, of which amount $10.01 was gold.

The Pfeifer and Fisher mills, in Six-mile canyon, near Virginia, is running; the cyanide plant is closed down for the winter.

WASHOE COUNTY.

At the Reno Star, Reno, ore running as high as $1 to the pound is reported.

Work in the tunnel of the North Mountain, Peavine, is progressing; good ore is being taken out.

WHITE PINE COUNTY.

A strike of rich ore is reported made in the Oro, near Ely.

NEW MEXICO.

BERNALILLO COUNTY.

A 5x7 drift will be run on the A level of the Lone Star, at Bland.

COLFAX COUNTY.

The Yellow Bandana, in Touch-Me-Not canyon, Baldy mountain district, will be worked on a large scale by the Wooster (O.) G. M. & Tunnel Co.——The Taos G. M. & M. Co. will put in a mill at the Black Copper, near Elizabethtown. —— The Montezuma, on Baldy mountain, is leased to H. Finch; ten men are employed—— Ore from the Black Horse, according to smelter returns from Pueblo, runs from $10 to $18 per ton; P. H. Van Zuylen manager and leaser; 1700 feet of development work is completed on the property.—— Work is progressing on the Rebel Chief, Mountain Queen, Aztec, Paragon, Smuggler, French Henry, Black Joe, Mystic and McGinty, on Baldy mountain.——The Ohio G. M. Co. will put in a new mill and other machinery on the Denver, at Elizabethtown; 100 men will be employed during the winter.——Work on the Legal Tender, in Willow gulch, is progressing; ten men are working; the cyanide plant is running steadily.——A new mill will go in on the Senate-Bobtail next spring; ten men are employed at present.——The Raton, Texas & Gulfky is projected, to connect Raton with the Chicora coal fields near there.

GRANT COUNTY.

The Royal Copper Co., operating properties near Cap mountain, Lordsburg, has sunk a 65-foot shaft on the Atlantic; a new 100-foot shaft will be sunk; the shaft on the Manila, now down 50 feet, will be continued to the 100-foot level.

SOCORRO COUNTY.

At the Last Chance, at Mogollon, the amalgamation plant is running steadily. ——The Silver Bar M. Co. is taking out good ore from the Silver Bar; twenty-five men are employed.——In the Little Fanny good ore is being mined.——The B. O. B. will resume.

OREGON.

BAKER COUNTY.

On Dixie creek, 7 miles from Prairie City, and about 60 miles from Baker City, is located the Quartzburg district, once famed for its rich placer mines, and is now attracting attention because of quartz deposits carrying gold and copper.

On the Present Need, 45 miles northwest of Baker City, a 400-foot tunnel is being driven to tap the ledge at a depth of 750 feet; ore is free milling; F. Morey, manager.

The Gem, Sparta district, is reported bonded to Denver men; there are three shafts on the property—one 190 feet, one 87 feet and an incline shaft on the vein down 450 feet.

UTAH.

BEAVER COUNTY.

Manager A. B. Lewis, of the Imperial and Royal Copper Companies, reports a strike in the old Atlas, near Frisco.—— Another strike of silver-lead ore is reported made on 200-foot level of the Hickory group.

IRON COUNTY.

The Abe Lincoln group, comprising three claims, 6 miles from Highland, is reported sold to California men; the property adjoins the Half Moon group, now being operated by Salt Lake parties, who are running a stamp mill at Highland. The management of the two properties will jointly run a stamp mill and a concentrator; ore runs $9 gold, thirteen ounces silver and 6% lead to the ton.

Ore (gold and silver) in sight on the Johnny & Victor claims, at Stateline, owned by the Johnny G. M. & M. Co., is estimated at 6064 tons, valued at $189,677.60.

A new boiler, hoisting engine and pump are in on the Johnny at Stateline; Manager W. J. Dooley. Sinking of the shaft, now down 170 feet, will be continued when the latter is unwatered. Ten additional stamps will probably be put in early next year.

JUAB COUNTY.

The Centennial-Eureka, at Tintic, is credited with earning $30,000 per month net under its contract with the American S. & R. Co.

The Utah, at Fish Springs, is shipping high-grade silver and lead ore to the sampler at Salt Lake.

The shaft on the Ridge and Valley is to be sunk 150 feet from present 600-foot level; a drift will be run to cut the ore.

A good-sized body of ore is opened up in the south drift on the 450-foot level of the Alaska.

Good ore is being taken out of the Orient at West Tintic. An upraise is being run on the vein, and a drift east toward the old Scotia.——The Mammoth mill at Tintic is running again.——Ore is opened up in the 800-foot level of the Mammoth at Tintic.——The Star Consolidated recently shipped four cars of ore to Salt Lake which returned $2300. Manager Packard reports good results at the mine.——Manager J. A. Hunt reports satisfactory progress at the May Day.

Shipments of ore from mines of Tintic for week ending Dec. 22 are as follows:

	Cars.
Centennial-Eureka	39
Gemini	22
Godiva	2
May Day	4
Humbug	1
Grand Central	10
Ajax	2
Mammoth	8
Carissa	5
Tesora	8
Joe Bowers	1
Swansea	6
Star Con	4
South Swansea	3
Total	115
Concentrates—	Cars.
Eureka Hill	9

The Tesora M. Co. of Tintic has bought the Cornucopia and Treasure Hill mines, adjoining the Tesora, near Silver City, for $40,000; the company will drift from 400-foot level of the Tesora to strike the Treasure Hill at the 600-foot level.

PIUTE COUNTY.

The Oro Monte M. Co., capital $30,000, is incorporated to work the Tunnel and other claims in the Mount Baldy district.

SALT LAKE COUNTY.

Returns from two cars of ore from the Red Wing, at Bingham, show 38% lead, twenty-seven ounces silver and $1.60 gold per ton.——The Carrie Mack M. Co., capital $100,000, is incorporated at Salt Lake, to work the Homestake and other claims in Little Cottonwood district, near Salt Lake.

The Highland Boy, Bingham, on the 22nd inst., shipped 60,102 pounds of pig copper to the East.

When at highest speed the Highland tram, Bingham, dumps 120 buckets of ore per hour.——At the Fortune a connection is made with the Freedom tunnel.

The Bingham C. & G. M. Co.'s new smelter, at Bingham, is nearing completion; Supt. of Construction W. H. Nutting expects to have everything under cover this week.

The Ben Butler, Bingham, will put on more men, preparatory to opening up two new drifts.

SUMMIT COUNTY.

On the 18th inst., Purchasing Agent J. C. Griffiths, of the American Zinc & Lead Smelting Co., bought 1000 tons of lead and zinc ore from the Crescent, Park City; ore is said to carry 32% zinc, 20% lead and about 10 ounces silver to the ton.

Work on the Silver King aerial tram, Park City, is practically suspended for the winter; twenty-one men were laid off recently.——The California mill is again running steadily and reports state that new ore reserves are being shown up in the mine daily.——Twenty-one bars of silver bullion, 1000 fine, were shipped East from the Marsac refinery recently.

Following are shipments of ore from the Mackintosh sampler for the week ending Dec. 22:

	Pounds.
Daly-West	1,161,000
Silver King	910,000
Ontario	453,000
Anchor (concentrates)	305,000
California (concentrates)	12,000
Total	2,841,000

The Ontario (silver), at Park City, has produced over $30,000,000, and has paid $13,662,500 in dividends; output is seventy-five tons ore daily; 250 men are employed.

TOOELE COUNTY.

J. A. Jacobson will push work on property near the Honerine at Stockton during the winter.——The Sacramento is turning out 140 tons of ore daily.

A 4-foot vein of steel galena is reported at a depth of 10 feet in the new shaft on the Black Diamond group.

New rolls have been put in the Daisy mill, at Mercur; 75,000 tons of ore are estimated in sight.

WASHINGTON.

FERRY COUNTY.

The pay shoot in the Chico, Republic, shoot has been widened out to 6 feet; operations have been delayed owing to new valves for the compressor being lost in transmission; the compressor has been out of use for four months.——The tunnel on the Racket is in 160 feet.——North and south drifts are being run on the 300-foot level below the tunnel level of the Princess Maud.

Supt. Behne, of the Palo Alto, reports ore in drift as improving in value with development, increase running from $2.50 to $25.40 to the ton: average is about $10 to the ton.

Considerable surface work is being done on the Chespa-Blue Jay, at Republic; H. L. Neville, Supt.——The Golden Chariot will probably soon resume.

Up to Dec. 15, in the new Republic mill, Republic, twenty-four tanks have been cleaned up, representing 2400 tons of ore; the last six tanks cleaned up showed the following percentages of savings: 91.43, 91.69, 91.90, 94.15, 94.35 and 94.98. The company has 184 men working, as follows: Mill, 52; mine, 57; construction work, 26; on flume, etc., 49.

Ore running from $2.50 to $6.65 per ton is being taken out at the Morning Glory No. 2, 1500 feet from the Morning Glory; a new shaft house will be built, and a new shaft sunk.

KING COUNTY.

The following shows the total coal output for 1900 and 1899.

	1900.	1899.
Pacific Coast Co., Newcastle	173,049	155,205
Pacific Coast Co., Franklin	153,090	165,421
Pacific Coast Co., Lawson	69,470	36,611
Pacific Coast Co., Gem	30,000	......
Black Diamond Coal Mining Co., Black Diamond	208,200	217,643
Issaquah Coal Co., Issaquah	128,294	107,938
Seattle Electric Co., Renton	31,178	35,008
Cedar Mountain Coal Co., Cedar Mountain	3,000	......
Totals	796,281	717,826

KITTITAS COUNTY.

Ore from the Blue Jacket at Nelson Siding, near North Yakima, is said to assay from $4.40 to $43 per ton.

OKANOGAN COUNTY.

The 40-foot tunnel on the Buckhorn (copper) is expected to be completed soon. ——The Washington group is reported sold to Philadelphia men for $20,000, and the Tintic group to same parties for $30,000.

SPOKANE COUNTY.

Spokane has decided to hold a mining exposition in Spokane from June to November, 1902. Congress will be asked for an appropriation of $250,000. Each State and district represented will also be asked to contribute.

The Oronoco M. Co., capital $100,000, is incorporated at Spokane.

STEVENS COUNTY.

The First Thought M. Co., operating the First Thought, at Vossburg, will put in a smelter on the property next year.

The Bear Mountain M. & Dev. Co., capital, $50,000, is organized at Colville, to work properties on Bear Creek, 12 miles from there; a 500-foot tunnel is being driven; ore will be shipped to the North port smelter next year.

WYOMING.

Twenty-one miles west of here H. Schwartz has eleven claims near Hecla of oxidized copper ore. There is a stamp mill and leaching outfit. He will use the Gardiner copper leaching process.

Cheyenne, Dec. 21.

FOREIGN.

AUSTRALIA.

The main shaft on the New Bendigo group, at St. Arnaud, Victoria, is down 700 feet.——Ore recently opened up on the Cecil Rhodes, at Kyneton South, in the Lauriston district, ran one ounce to the ton in a 30-ton mill test.——From a run of 925 tons of ore from the Russell's Reef, 603 ounces gold were returned.

BRITISH COLUMBIA.

The shipment of ore from Rossland for 1900 aggregated 220,000 tons, practically shipped by three mines, the Le Roi 160,000 tons, the Center Star 40,000 tons, the War Eagle 10,000 tons.

The ore shoot recently opened up in the first, second and third levels of the I. X. L., Rossland, is 185 feet in length; ore is said to average $100 per ton.—— With the new cyanide plant soon to go in at Ymir, it is thought that a saving of $1 per ton will be made, making a total of about $600 monthly.——The Athabasca G. M. Co. has taken over the assets and affairs of the Exchequer G. M. Co., and will work ores from the Athabasca with its cyanide plant.——Ore from the Big Four group, in Porcupine creek district, near Nelson, runs $40 to the ton; operations on the group are closed down for the winter.——Work on the Big Horn group, same district, is progressing; two shafts are running a crosscut. W. M. Edgar, Supt.

The pay roll of the St. Eugenie, at Moyie, for November, was $26,000; ore shipments for same period were 2600 tons.

In the Atlin district considerable work has been done on the benches on Willow creek, with results which show them to be richer than the creek claims.——The Atlin-Willow Creek M. Co. during the season worked its gravel beds on Willow creek with giants.——The Surprise Gulch Hydraulic M. Co. has built over 4½ miles of ditches and flumes during the season; 2 miles more of ditches will have to be built to reach the falls on Pine creek, from which it expects to obtain its water supply.——The McKee Creek M. Co. is putting in a new plant.

The Mother Lode, near Greenwood, has shipped 4435 tons of ore to the smelter at Greenwood, which will be blown in March 1st.——The main building, 182x120 feet, of the new Standard Pyritic Smelt. Co.'s smelter, 3 miles below Greenwood, on Boundary creek, is completed; plant will be put in soon; work on the flume which will bring water from the dam, one mile up the creek, is nearing completion; the hot and cold blast furnace will be 40x176 inches inside of tuyere lines; the smelter will treat 300 tons ore per day; Manager Laidlaw.

The consolidation of the Granby smelter and other interests of the Miner-Graves syndicate, in the Boundary district, into one company with a capital of $15,000,000, is confirmed, according to reports from Toronto and Montreal; a contract is closed whereby the Granby smelter will supply 700 tons of copper matte monthly to New York parties, and 200 tons monthly to Liverpool dealers. The consolidation will take in the Granby smelter, the Knob Hill, Old Ironsides and Grey Eagle, and the new company will be known as the Granby Con. M., Smelt. & Power Co.

The Arlington, at Slocan, has shipped 1205 tons of ore during season of 1900.—— A strike is reported in upper workings of the Enterprise.——J. F. Collom has relinquished the bond on the Mabou, above the Enterprise; bond was for $65,000.—— Operations on the V. & M. group, on Twelve-mile, are begun; shipments of ore are expected to be made in six weeks; Supt., C. W. Harrington.——Ferguson & Griffiths are running a drift on the Neepawa, Ten-mile.

The following are estimated figures for the coming year's output of mines at Rossland, based on statements of local mine managers:

Mine.	Tons.
Le Roi	275,000
Center Star	125,000
Le Roi No. 2	75,000
Nickel Plate and other B. A. C. properties	75,000
Iron Mask	20,000
Miscellaneous, including War Eagle, Evening Star, Giant, I. X. L., Velvet and Spitzee	30,000
Total	600,000

Appended are the shipments from January 1 to December 15, 1900:

Mine.	Tons.
Le Roi	158,180
Center Star	38,182
War Eagle	10,922
Le Roi (No. 1 and Josie)	2,922
Iron Mask	2,623
Giant	563
I. X. L	552
Evening Star	428
Monte Christo	273
Spitzee	155
Iron Colt	80
Total	214,880
From December 15 to January 1, 1901 (approximated)	15,120
Total	230,000

The Butcher Boy group, near Greenwood, is bonded to G. A. Sonneman of Spokane, Wash., for $100,000. —— The Carmi will soon begin shipping ore to the pyritic smelter near Greenwood.——Work on the Emma, in Summit Camp, is resumed. —— The Winnipeg M. Co. has levied an assessment of 1 cent per share. New machinery, consisting of a 30 H. P. boiler, 16 H. P. hoist, a 100-gallon per minute pump and 200 feet of rails, costing $2000, will go in. Work on the 300-foot level will be resumed.——The Alameda, in Deadwood Camp, is bonded to H. Shallenberger of Spokane.——The Dundee, at Ymir, will resume.—— The tramway at the Tamarac is nearly completed.—— Eighty stamps are dropping at the Ymir. ——The Fog Horn is reported sold to Spokane men for $35,000.

The Sovereign, at Slocan, is shipping ore to the Kaslo sampler.——Manager Parrish of the B. C., Phœnix, says that up to date 16,000 tons of gold-copper ore have been shipped from this mine. During October 4000 tons of ore were shipped; 2500 tons were shipped during November. Ninety men are employed. The shaft is down 384 feet. Sinking will be resumed.

——Near Salmo men are working on the Keystone and ore is being shipped.

MEXICO.

The Iguaran copper mines in the State of Michoacan, acquired about two years ago by the Rothschilds, are being developed on an extensive scale. Over $1,000,000 has been expended. The mines are some distance from railway transportation, and the owners propose building a road connecting the mines with some point on the Pacific coast to ship the product.

The Indianapolis & Sonora Copper & M. Co. of Indianapolis, Ind., operating in the Cananea mountains, Sonora, have forty men sinking, tunneling, etc.; operations on a large scale will be pushed next year.——Development on property in the Arizpe district, 10 miles from San Felipe, on the Sonora river, shows ore to run 275 ounces silver to the ton.

Monterey reports negotiations in progress for the purchase of six large smelters in Mexico and a number of the best paying silver and gold mines in the country by the American Smelting & Refining Co. Nearly $40,000,000 is involved in the deal.

It is reported that the Rosario, in Chihuahua, is sold to C. W. Clark of Butte, Mont., for $800,000. The erection of a large plant on the property is contemplated.

The placer mines on the Fuerte and Rio Mayo are turning out to be good holdings. One hundred pounds were shipped to the United States mint at San Francisco recently, the output of nine weeks' work with twenty men from the mines of W. M. Fiske, Fuerte, Sonora.

The Piedras Verdes copper property is now under examination by B. Tibby for W. A. Clark of Butte, Montana. The price asked is $1,000,000. The property consists of 400 claims 15 miles northwest of Alamos.

NEW ZEALAND.

A recent crushing of 80 tons of ore from the Four in Hand, at Coromandel, returned £416 ($2025.92). —— Twenty-two tons of ore from the Bunker Hill gave 115 ounces gold, valued at £350 ($1704.50). ——A twelve day's run of the Mananu Co.'s mill, at Whangamata, returned £888. ——Ore from the Monowai mines, Thames, is said to assay £175 ($852.25).——A strike of rich ore is reported from the New Whau, Thames.

SOUTH AFRICA.

The coal fields recently found in Rhodesia are situated 180 miles northwest of Buluwayo, and are estimated to cover an area of over 400 square miles; seams vary from 5 to 16 feet in width; coal lies within 40 feet of surface, and it will be worked by inclines instead of shafts; the Cape to Cairo Railroad will tap the fields.

A Belgian company, with a capital of $250,000, will mine in Abyssinia, concessions having been obtained from King Menelik, giving the right to mine for gold in Wallaga; it is said that $200,000 per annum is produced here with primitive methods.

TASMANIA.

The mineral exports for November were £122,000 ($594,140)—and for the last eleven months, £1,444,000 ($5,571,280).

Books Received.

Practical Coal Mining, 8vo., pp. 462, Geo. L. Kerr, London; Chas. Griffin & Co., Ltd., Philadelphia, J. B. Lippincott Co., of value to British colliery engineers, with some general formulæ of universal applicability, but of little practical avail as a whole to American workers. The book has over 500 illustrations.

Water Power, 8vo., pp. 563, Jos. P. Frizell, London, Chapman & Hall; New York, Jno. Wiley & Sons. This is one of the most valuable books on the subject received during the year. The contents are of an unusually high order of merit, and admirably arranged. There are twenty-five chapters, any one of which are worth the price asked for the book. The discussion of dams, development of natural water power and hydraulic motors are particularly good. The author of this book had something to say, said it, and quit when it was said.

Minerals and Mining of New Zealand, 1900; printed by the Government at Wellington, 4to., pp. 250, with accompanying maps, somewhat after the fashion of the biennial reports that used to be issued by the California State Mining Bureau, and of the same high order of usefulness. There is much valuable information, carefully prepared statistics, and elaborate tabulated details. Some of the items sound singular to an American reader, as, for instance, five pages of small type, "List of mine managers, battery superintendents, and engine drivers who have obtained certificates." The book is an epitome of New Zealand's mining industry, and shows growth and increase therein.

Personal.

E. Klemo of Bodie, Cal., is in Butte, Mont.

W. A. Clark of Montana is in Jerome, Arizona.

T. A. Rickard has returned to Denver from London.

G. A. Lonsberry, of Denver, Colo., is in Sonora, Mex.

E. H. Mead, of Leadville, Colo., is in Salt Lake, Utah.

T. Jacobson has returned to Salt Lake, Utah, from the East.

C. H. Dunton, Supt. Larkin, Placerville, Cal., is in Sacramento, Cal.

Jno. B. Shaw has been elected Sec. Gould & Curry M. Co., San Francisco.

R. H. Postlethwaite has returned to San Francisco from Nevada county, Cal.

W. G. Dodd, of the Union Iron Works, San Francisco, has returned from Yuma, Ariz.

M. W. Mather, Supt. Plumbago, Nevada City, Cal., is convalescing at that point.

Clay B. Steele has returned to Denver from New York and other Eastern points.

B. M. Newcomb, general Supt. Harvard G. M. Co., Jamestown, Cal., has resigned.

T. C. Gorrie, Supt. Santa Ysabel, Stent, Cal., is now agent for the Harvard, Jamestown, Cal.

H. T. Scott, of the Union Iron Works, San Francisco, has returned from Washington, D. C.

L. D. Sivyer has returned to Spokane, Wash., after an eight weeks' trip to Utah and Colorado.

Supt. G. Douglas, of the Gould & Curry, Virginia, has returned there from San Francisco.

A. Shorten is appointed Sec. Galena M. Co., Fish Springs, Utah, vice S. J. Paul, resigned.

Supt. J. C. Scafford of the B. C., Phœnix, B. C., has resigned; he goes to Rossland, B. C.

J. Boyd, manager Palmer Mountain Tunnel M. Co., Loomis, Wash., is in Spokane, Wash.

D. W. Brunton of Denver is engaged in professional work in the Mesabi iron range, Minnesota.

W. R. Ramsdell, of Spokane, Wash., and C. P. Bowker, of Rossland, B. C., are in Salt Lake, Utah.

H. Bolthoff of the Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo., is now traveling in Europe.

W. Wilson, formerly manager Elkton, Cripple Creek, Colo., has returned there from British Columbia.

J. P. Munger, Supt. Harvard G. M. Co., Jamestown, Cal., has resigned and goes to San Benito county, Cal.

Elias Rund of Taku Arm, near Atlin, B. C., is in San Francisco to buy mining machinery to operate quartz property for the Engineer M. Co.

G. M. Hyams has resigned as consulting engineer Anaconda, Parrot and all the other copper mines controlled by the Amalgamated Copper Co., Montana. He remains with the Boston & Montana.

A. W. Hudson has resigned the managership of the Northport, Wash., smelter and goes to New York. The management will now be in the hands of Bernard Macdonald, manager British America corporation mines, Rossland, B. C.

Recently Declared Mining Dividends.

	Payable.
Acacia M. Co., Colorado, 1 cent per share, $15,000	Dec. 22
Gold Coin M. Co., Colorado, 2 cents per share, $20,000	Dec. 31
Con. G. M. Co., Colorado, 1 cent per share, $10,000	Dec. 25
Isabella M. Co., Colorado, 1 cent per share, $22,500	Dec. 22
Star Con. M. Co., Utah, 5 cents per share, $18,000	Dec. 22
Bull Hill Con., Colorado, $15,000	Dec. 31
Centennial Eureka M. Co., Utah, 50 cents per share, $50,000	Jan. 1
American Smelting & Ref. Co., New York, 13.4% on preferred stock	Jan. 1
Boston & Colorado Smelt. Co., Colorado, 1½%, $11,250	Jan. 1
Ingham M. Co., Colo., ½ cent per share, $6750	Jan. 15

Commercial Paragraphs.

F. A. Rider is now connected with and interested financially in the Hassell Iron Works of Colorado Springs, Colo.

J. W. Richards, assayer, Denver, Colo., reports an increasing number of ore samples from many and widely divergent points, indicating unusual activity in the mining industry.

The mining equipment of the Biwabik, Mich., ore mine includes three shovels, two of which are 85-ton and one 65-ton, Bucyrus. These three shovels, during the present season, have mined from its natural bed 915,000 gross tons of ore, working day shift. In a single month they mined 205,000 tons. One of these the 65-ton), in ten hours, loaded 185 twenty-nine ton cars, or 5365 gross tons.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING DEC. 18, 1900.

664,033—Can Opener—C. A. & O. Anderson, Portland, O.
664,073—Hoist—H. C. Behr, S. F.
664,213—Brake—H. A. Denney, Reardan, Wash.
664,245—Lock—J. A. Eastman, Fruitvale, Cal.
664,246—Candle—W. R. Ellis, Livermore, Cal.
664,138—Hotel Register—C. E. Elstner, Los Angeles, Cal.
664,142—Can Filling Machine—F. B. Fulton, Anacortes, Wash.
665,881—Horse Hitching Device—N. L. Goodwin, Thorp, Wash.
663,992—Saw Filing Machine—S. W. Gutridge, Granite, Ogn.
663,895 — Power Transmitter — J. Herbs, Fall Brook, Cal.
663,993—Gold Separator—W. W. M. Hickey, S. F.
664,215—Sled—R. E. Hickson, Moro, Ogn.
664,154—Paint—J. A. Hommel, Los Angeles, Cal.
664,048—Saw Handle—J. Jett, S. F.
663,969—Massage Chair—Johnston & Vanorman, Los Angeles, Cal.
663,905—Pulley Block—E. Knight, McCloud, Cal.
664,022—Hydrocarbon Burner — G. H. Larkin, S. F.
664,052—Bicycle—O. J. Laury, Redding, Cal.
664,054—Draper Slat Protector—C. J. & T. T. Luckehe, Gridley, Cal.
663,914—Treating Ores—H. Luckenbach, Seattle, Wash.
664,330—Amalgam Press—A. Mackey, Douglas Island, Alaska.
664,292—Motor Vehicle—W. Riddell, S. F.
664,298—Nozzle Tip—F. W. & H. L. Shupert, Spokane, Wash.
664,300—Gummer—D. M. Smyth, Pasadena, Cal.
664,029 — Gas Generator — V. T. Weathers, Ione, Cal.
664,030—Comb Cleaner—J. H. Wheeler, S. F.
33,761—Design—W. S. McRay, Cosmopolis, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Design for Horseshoe Pad.—No. 33,691. Dec. 11, 1900. J. Ewing, San Francisco, Cal. This invention relates to a novel construction of elastic pad which is adapted to be attached to horseshoes to form a resilient bearing for the weight of the horse. It consists of a crescent-shaped block having a thin, flat plate with curved edges and the rear formed with a solid block of greater thickness with divergent annular ends to fill the space between the heels of the shoe.

Bed Bottom Attachments.—No. 663,170. Dec. 4, 1900. John Hoey, San Francisco, Cal. This invention relates to an attachment for bed bottoms of that class known as "wire" bed bottoms. It consists in the combination with the side rails and transverse bars of a bed bottom, of a cap or housing for said bars including a double series of parallel horizontal flanges. One series of these flanges forms a housing for the end bar, and the other series forms a housing for the side rail, said latter housing having its flanges extended beyond those of the other series. Vertical transverse end flanges connect the horizontal flanges, and the cap or housing has a centrally located bridge or extension for raising the end bars above the side rails, and having an exterior covering plate.

Face Steamer.—No. 663,574. Dec. 11, 1900. W. C. Keithly, San Francisco, Cal. The object of this invention is to provide a device by which the vapors of various liquids may be brought into contact with the face, or to be inhaled by the person undergoing treatment. It consists of a generator having an upwardly extending wall at one side curved transversely, a perforated chamber lying against this wall, terminating short of the upper limits thereof, the lower portion of this chamber being in direct communication with a generating chamber, and a means for heating the latter so that the vapor will pass through the perforated wall. A flexible hood or attachment is adapted to form a closure for the upper part of the apparatus and to enclose the head of the patient so as to confine the vapors.

Draper-Slat Protector.—No. 664,054. Dec. 18, 1900. C. J. & T. T. Luckehe, Gridley, Cal. This invention relates to a means for protecting the transverse bars or slats which are employed in connection with endless traveling canvas or other belts. It consists of a metal piece or cap fitting upon and partially enclosing the slat and having transverse and convex corrugations or runners between which the rivet is headed which secure the cap and the slat together. This prevents the wear which would ordinarily cut off the rivets or their heads, so that they would pull through and allow the parts to become detached, the corrugations forming a channel of sufficient depth for that purpose.

Gold Separator.—No. 663,993. Dec. 18, 1900. W. W. M. Hickey, San Francisco, Cal. This invention relates to an apparatus for separating gold from sand and other material with which it may be associated. It comprises an inclined screen, an amalgamated plate below the screen having riffles, a water tank, a chute connected with the amalgamated plate and inclining reversely thereto. In connection with this is an amalgamated drum or cylinder below the discharge end of the chute which receives material therefrom, and the material which is discharged from the cylinder is received upon a belt submerged within a water-containing tank and traveling so as to convey the material away continuously. The belt passes around drums at opposite ends of the tank and the cylinder is driven by connections from one of these drums. The screen, amalgamated plate and chute are caused to reciprocate by suitably connected mechanism, and by means of a pumping mechanism the water is raised continuously and discharged into the upper part of the apparatus, the pump being actuated in unison with the movement of the other parts.

Comb Cleaner.—No. 664,030. Dec. 18, 1900. J. H. Wheeler, San Francisco, Cal., one-half interest assigned to Wm. Wilson of same place. This device is intended to clean combs, such as are used for the hair, and to remove any dirt or obstruction which ordinarily accumulates between the teeth of the comb. It consists of a frame or holder having parallel sides, wire coils upon said sides and a wire or strand wound around the sides and through the interstices of the coils, so that the wire is equidistantly fixed to form rows, the wires of one row spacing intermediate with the wires of the other. These rows thus lying in parallel planes, it is only necessary to press the comb upon them, and they will pass between the teeth of the comb and clean out any deposit which may have been formed therein.

Bicycle.—No. 664,052. Dec. 18, 1900. O. J. Lawry, Redding, Cal. This invention is designed to provide a relief for the riders of bicycles by making the axles or journals of the wheels and their bearings movable in suitable guides in the frame, supporting said axles against the pressure by springs of sufficient stiffness. The forks of the frame have slotted inner sides and the wheels are adapted to revolve between the forks, and are provided with a guide interior to each member extending some distance above and below their point of connection with the wheel axle. Each of said guides has its upper and lower ends slotted, one at right angles to the other, and the slots are provided with rollers adapted to travel in contact with the inner walls of the forks so that the movement will be easy and the axles will not bind; at the same time the wheels will be kept in an essentially vertical position between the forks. Above these slides are sufficiently stiff and elastic springs upon which the weight of the machine and the rider is carried. These springs constantly yield to all obstructions and irregularities of surface and thus form a very easy riding machine.

Lock.—No. 664,245. Dec. 18, 1900. J. A. Eastman, Fruitvale, Cal., assignor to C. R. Eastman of same place. This invention is designed to provide an improved lock for doors, sashes and other meeting parts. It comprises a locking bolt or latch having its rear end connected with a swinging link so that the outer end or head of the latch may be projected through the continuous slots in the lock and the keeper, and mechanism is provided by which the bolt is afterwards depressed so that its enlarged head will be engaged with the keeper by a positive movement. A reverse movement of the parts will lift the bolt and carry it backward into the lock case which is fixed to one of the doors. The device thus forms a very efficient means for securing the parts together.

Latest Market Reports.

SAN FRANCISCO, Dec. 27, 1900.

SILVER—Per oz., Troy: London, 29⅝d (standard ounce, 925 fine); New York, bar silver, 64c (1000 fine); San Francisco, 64c: Mexican dollars, 50¾c.

Regarding the buying of silver, Bradstreet's reports that the buying for Eastern account in London has slackened again, but the offerings are moderate, and no accumulation of supplies of bars can be seen. Further buying orders for India are expected to make their appearance ere long, as trade conditions in that country are in a favorable state and the demand for money for circulation is large. The matter depends, however, to a large extent on the ability of the Indian Government to draw gold from Australia once more.

COPPER.—New York: Lake, 1 to 3 casks, $17.25 cash; carload lots, 17.00; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.75; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.37½; Salt Lake City, $4.00; St. Louis, $4.25; San Francisco $5.00, carload lots; 5¼c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £16 2s per ton.

SPELTER. — New York, $4.55; St. Louis, $4.10; San Francisco, ton lots, 5¼c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9¼c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $13.00; gray forge, $13.25; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $19.75; open hearth billets, $21.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $27.00; FranSancisco, ton lots, 29c; 1000 ℔s., 29¼c; 500 ℔s., 29½c; less, 30c; bar tin, ⅌ ℔, 35c.

QUICKSILVER. — New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.00 ⅌ flask of 76½ ℔s.; Export, $45.

During last month 1654 flasks were received at San Francisco. Sea exports therefrom for the eleven months to Dec. 1st were 6588 flasks.

NICKEL.—New York, 50@60c ⅌ ℔.

MAGNESIUM.—New York, $3.00 ⅌ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¼c; slab, 5¾c; bar, 7c.

BABBITT METAL.— San Francisco, No. 1, 10c.

SOLDER. — Half-and-half, 100-℔. lots, 18½c; San Francisco, Plumbers', 100-℔. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c ⅌ ℔, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

BISMUTH.—New York, ⅌ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

PHOSPHORUS. — F. o. b. New York 50@60c ⅌ ℔.

TUNGSTEN.—New York, ⅌ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

PLATINUM.—San Francisco, crude, $17 ⅌ oz.; New York, $18.20 per Troy oz

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¼c ⅌ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c ⅌ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ⅌ ℔.; soda ash, $1.60 ⅌ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ⅌ ℔.; blue vitriol, 5½@6c ⅌ ℔.; borax, concentrated, 7@8c ⅌ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ⅌ ℔.; caustic soda, in drums, 3@4c ⅌ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ⅌ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

OILS.—Linseed, pure, boiled, bbl., 86c; cs., 91c; raw, bbl., 84c; cs., 89c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 70c; cs., 75c; No. 1 bbl., 50c; cs., 55c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 65c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

THE ONLY WAY TO REACH THE READERS OF THE : : : MINING AND SCIENTIFIC PRESS

is through the MINING AND SCIENTIFIC PRESS. Its readers comprise the users and buyers of Mining Machinery and Mining Supplies and Apparatus throughout this west half of America.

SITUATIONS WANTED.

Position as superintendent of gold mine wanted by a Mining Engineer who has had 11 years' practical experience in mines, mills and cyanide plants in California and abroad. Has his own assay outfit. Address M. E. M., Mining and Scientific Press.

YOUNG MINING AND MECHANICAL ENGINEER desires position. Technical and practical training. First-class mine and land surveyor. Neat and accurate draughtsman. Six years' experience. Accustomed to handling men. No objection to office work. Excellent references. Address E. N., this office.

Mining engineer with ten years' experience in copper and lead mining, milling and smelting, desires to secure position as superintendent or manager of developing or producing property in this country or abroad. Good assayer, surveyor and bookkeeper. Address "Montana," care of Mining and Scientific Press.

WANTED—A position as superintendent for a mining company by a man of 16 years' practical mining experience; understands mining and milling (amalgamation, concentration and leaching); good assayer and accountant; would accept a subordinate position if good; references. Address "Advertiser," 1225 Webster St., Oakland, Cal.

A position as superintendent or mining foreman by a man of 20 years' practical experience in mining in all its branches in the different mines in California and Mexico—gold, silver, copper and quicksilver mines. Have had the handling of large forces of men. Can speak Spanish. Can go through and secure any kind of ground. The best of references. D. E. F., care this office.

CHEMIST AND ASSAYER, with experience in draughting, bookkeeping and typewriting, desires position as assayer or assayer and bookkeeper in mine or as secretary to mining engineer or mine official. Has fair literary and scientific education. Experience in the preparation of reports, prospectuses and catalogues. Excellent moral character and good health. For further particulars, address E. R. M., care Mining and Scientific Press.

Engineers, Firemen, Machinists and Electricians: New 40-page pamphlet containing Questions asked by Examining Board of Engineers. Sent free. GEO. A. ZELLER, Publisher, ST. LOUIS, MO.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of the CONS. ST. GOTHARD GOLD MINING COMPANY will be held at the office of the Company, 113-114 Crocker Building, San Francisco, California, on THURSDAY, the 10th day of January, 1901, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

Transfer Books will close on MONDAY, December 31, 1900, at 3 o'clock P. M.

B. N. SHOECRAFT, Secretary.

Office—113-114 Crocker Building, San Francisco, California.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of THE REAL ESTATE COMBINE will be held at the principal office of said Corporation, said principal office being situated at No. 14 Sansome St., Room No. 15, San Francisco, California, on THURSDAY, the 17th day of January, A. D. 1901, at the hour of 3 o'clock P. M. of said day; said meeting being held for the purpose of electing a Board of Directors to serve for the ensuing year and for the transaction of such other business as may come before the Meeting.

GEORGE STERLING, Secretary.

Principal Office—No. 14 Sansome St., Room No. 15, San Francisco, California.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of THE REALTY SYNDICATE will be held at the principal office of said Corporation, said principal office being situated at No. 14 Sansome St., Room No. 15, San Francisco, California, on THURSDAY, the 17th day of January, A. D. 1901, at the hour of 11 o'clock A. M. of said day; said meeting being held for the purpose of electing a Board of Directors to serve for the ensuing year and for the transaction of such other business as may come before the Meeting.

J. C. WINANS, Secretary.

Principal Office—No. 14 Sansome St., Room No. 15, San Francisco, California.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of the PIEDMONT DEVELOPMENT COMPANY will be held at the principal office of said Corporation, said principal office being situated at No. 14 Sansome street, Room No. 15, San Francisco, California, on WEDNESDAY, the 16th day of January, A. D. 1901, at the hour of 3 o'clock P. M. of said day; said meeting being held for the purpose of electing a Board of Directors to serve for the ensuing year and for the transaction of such other business as may come before the meeting.

GEORGE STERLING, Secretary.

Principal office—No. 14 Sansome street, Room No. 15, San Francisco, California.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of the MUTUAL INVESTMENT UNION will be held at the principal office of said Corporation, said principal office being situated at No. 14 Sansome street, Room No. 15, San Francisco, California, on MONDAY, the 21st day of January, A. D. 1901, at the hour of 3 o'clock P. M. of said day, said meeting being held for the purpose of electing a Board of Directors to serve for the ensuing year and for the transaction of such other business as may come before the meeting.

J. C. WINANS, Secretary.

Principal office—No. 14 Sansome street, Room No. 15, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, HAVING received applications to mine by the hydraulic process from John Costa et als., in the Lady's Canyon Mine, near Sierra City, Sierra Co., to deposit tailings in worked-out pits; from W. B. Dudley et als., in the Dudley Placer Mine, near North Columbia, Nevada Co., to deposit tailings in a worked-out pit; from the Eagle Gold Mining Co., in the Reichel Claim, near Mountain Ranch, Calaveras Co., to deposit tailings in Murray Creek; and from the Emery Gold Mining and Water Co., in the Rose Hill Mine, near Mountain Ranch, Calaveras Co., to deposit tailings in Murray Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on January 14, 1901, at 1:30 P. M.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says: "Its the best **GOLD** saver in the world."

Capt. H. R. Gillingham, Cid., N. C., says: "Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says. "Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape
